About the Editor

Gregory A. Borchard, a professor of mass communications and journalism at the Hank Greenspun School of Journalism and Media Studies at the University of Nevada, Las Vegas, serves as the School's associate director. Dr. Borchard's research focuses on the history of journalism, and he has taught widely across curriculum in reporting, journalistic writing, journalism history, journalism surveys, and graduate-level qualitative methods. Among his contributions to scholarly literature are authored books, including *A Narrative History of the American Press* (Routledge, 2018),

Lincoln Mediated: The President and the Press Through Nineteenth Century Media (Transaction Publishers, 2015, Routledge, 2020), *Abraham Lincoln and Horace Greeley* (Southern Illinois University Press, 2011), and *Journalism in the Civil War Era* (Peter Lang, 2010). He served as editor of *Journalism History* (Taylor & Francis) for the Association for Education in Journalism and Mass Communication's (AEJMC) History Division and co-edited *The Antebellum Press: Setting the Stage for Civil War* (Routledge, 2019).

Introduction

Media saturates the world in which we live, and as a driving force behind the messages we receive from it, journalism has become an instrumental way in which we navigate daily life. The mainstreaming of social media since publication of the first edition of the *Encyclopedia of Journalism* (SAGE, 2009) has helped users not only keep in touch with family and friends, it has also allowed them to interact with reporters and allow journalists of broad backgrounds to develop large followings across a number of social media platforms. This exchange has created a dynamic in which social media users both interact with news providers and allow users to supply news content and in turn determine it.

The information-based society in which we live has in turn directly transformed the delivery of news, as well as its meaning and content. On basic levels, we no longer have to wait for the daily paper or the 5 p.m. news to know the events of the day, as we can simply access our smartphones to look at social media feeds. Individual media outlets, meanwhile, no longer strictly report the news but instead quite often present information in accordance with their own preferences and those of their consumers.

This second edition of the *Encyclopedia of Journalism* surveys the contemporary state of journalism, featuring analyses of important topics relative to the practice of the profession in the second decade of the 21st century. The entries featured in this edition integrate journalism into a framework of the technological developments of the past and present, providing a context for understanding current professional, legal, and social issues affecting the field.

At the same time, the second edition of the encyclopedia expands the scope of issues featured in the encyclopedia's first iteration to illuminate media internationally. It includes updated analyses

of social media, and it delves into the complex nature of interconnected media conglomerates. The second edition also revisits previous entries that required revision for timeliness, a necessity given the rapidly changing field of journalism itself. While the focus of the entries, like the first edition, remains on the gathering, editing, reporting, and distribution of news, it has been designed to present a comprehensive analysis of the trends, issues, concepts, individuals, institutions, media outlets, and events that go into making journalism a pivotal part of global media.

Readers' Guide

In the Reader's Guide accompanying the main volumes of the encyclopedia set, you will find a listing of categories that associate each entry—more than 400 of them—with a key topic, including themes based on media types, institutions, and practices. While the contents of the encyclopedia use these concepts to weave an overall description of journalism and the various facets of contemporary media, you may consult with the Reader's Guide for a more systematic listing of entries.

In general, the encyclopedia features the following broad descriptions of topics tied to journalism and the media:

- Broadcast (radio and television, its practice and definition, organizations, technology, and historical issues and people);
- cultural issues in journalism;
- the economics of journalism;
- the freedom of the press in American history;
- journalism, as practiced and defined, its techniques and types in the United States and internationally, organizations, law and policy, coverage of issues and controversies;
- media regulation and oversight;

- theories;
- photojournalism (issues and its history);
- the practice and definition of online journalism;
- the press and politics;
- print journalism (production, its practice and definition, historical issues and key figures);
- public relations (its practice, issues, and history);
- the social and ethical aspects of journalism;
- social media organizations;
- the technological aspects of journalism; and
- the visual orientation of journalism.

To help navigate these descriptions, we have developed 30 categories that list individual entries that fall under each heading, a systematic way of navigating the encyclopedia's contents. (Please see the Reader's Guide for the 30 individual categories.) Entries that address more than one of the categories have been cross-listed, providing an illustration of the interconnectedness of the various types of media and journalistic conventions.

Of special note: A feature of particular interest for the second edition includes additional attention to the international scope of journalism. This edition—to an even greater degree than the first edition—includes entries with specific attention to both regions and the most populated nations on earth. Accordingly, you will find listed in the Reader's Guide a subcategory of regions that includes Australia and New Zealand, North Africa, Sub-Saharan Africa, Central Asia, East and Southeast Asia, South Asia, Europe, Central America and the Caribbean, Middle East, North America, and South America. You will also find individual entries on the top 10 most populated nations, including Bangladesh, Brazil, China, Germany, India, Indonesia, Japan, Nigeria, Pakistan, and the Russian Federation. In addition, you will find a subcategory of topics that address specifically international issues in journalism, creating a new global dimension unique to the second edition.

Content and Organization

The four-volume *Encyclopedia of Journalism* comprehensively covers the dimensions of journalism in its various media formats, including print, broadcast, and online journalism. The set compiles more than 1 million words and contains more than 400 entries edited by Gregory A. Borchard, a

professor in the Hank Greenspun School of Journalism and Media Studies at the University of Nevada, Las Vegas. In the A-to-Z volumes 1 through 4, both scholars and journalists contribute articles that span a spectrum of topics explored in the first edition with revisions. The vast majority of entries you will see featured in the second edition consist of either new additions to the volumes or those that have been revisited for revisions and updates with only a fraction of topics having ever-green qualities. Of the more than 400 individual entries (or "headwords") published, more than one third of them were newly authored for the second edition so that along with updates to previously published entries, the reissue of the encyclopedia features an entirely fresh perspective on journalism.

Readers of this updated content will discover information on the ways journalists have adapted their practices, sometimes abandoning traditional news cycles and reporting techniques, and replacing them with live coverage through updates on social media platforms. They will find entries detailing the ways the access to information on social media platforms has changed the very content of news itself, as platforms have facilitated the use of short, easily digestible summaries consistent with consumer tastes and trends. They will also read how major media outlets have met consumer-driven demands for the most recent information available, including familiar topics and issues that affect users individually. Readers will also have a clearer picture of how journalistic content has transcended both geographic boundaries, as well as time, by providing a sense of immediacy, sometimes defined by rapid changes in corporate ownership, mergers, and transnational reach. In sum, the second edition of the *Encyclopedia of Journalism* provides an overview of the role of journalism in the 21st century and beyond. It addresses the challenges facing journalists and features the best established practices for meeting them. In doing so, the encyclopedia provides a glimpse into the future of the profession.

Creating the Second Edition

The goals for the second edition of the *Encyclopedia of Journalism* were spelled out in proposals between the editor and the development director in

2019, and they suggested the reissue would—as did the first—cover significant journalistic concepts associated with print, broadcast, and online media from American and international perspectives. I suggest with no redundancy intended that while the world in general—no less the field of journalism—transformed remarkably since 2019, the goals for the second edition remained intact. In spite of challenges attributed to the global COVID-19 pandemic, contributors developed timely entries that in many ways addressed the changes in journalism brought about by lockdown conditions. Contributors during each stage of development wrote with a target audience consisting of college and university students at the undergraduate and graduate levels, predominately in journalism, communications, and media-oriented programs. We sought to produce material appropriate for general reference that at the same time would provide valuable, updated information for journalists and media practitioners familiar with the profession.

To accomplish these goals, the second edition in some cases added entirely new entries appropriate for changes that have taken place in journalism since 2009. Using concepts that categorize topics and focus on these changes, the second edition describes the evolution in journalistic practice, its consumption, and the business of journalism, along with updates and historical context on global news coverage.

The following list of remarkable entries—a small sample from the hundreds featured—each share the characteristic of containing substantial content in terms of their scope, depth, and development. These entries (among others) required significant research on the parts of the authors and reflect a combination of new and timely material, as well as research rooted in historical background. Immediately following each of the entry names below, you will also find a respective category from the Reader's Guide, illustrating the concepts categorized by the guide itself and featured in the encyclopedia as a whole.

For example, a reader interested in finding information on the subject of Arts Journalism will find a listing for it under the category “Social and Ethical Aspects of Journalism,” along with several other entries appropriate for this category. This entry—and all others, regardless of their category—provide cross-references to related entries for

contextual purposes. Likewise, a reader interested in finding information about Censorship and issues related to it would find a listing for the topic under the category of “Law and Policy”—at the same time, it is also listed in the separate (but related) category of “Media Regulation and Oversight.” Similarly, if you are looking for the entry on the First Amendment, you will find it in “Freedom of the Press in American History” and “Law and Policy,” along with other topics associated with these concepts. Readers can navigate the categories with a bit of intuition, keeping in mind the names of categories listed here represent, again, just a sample of those you will find in the Reader's Guide, with Documentaries, for example, found in “Journalism Practiced and Defined,” Investigative Journalism in “Journalism Techniques,” and Political Reporters in “The Press and Politics,” etcetera.

Acknowledgments

You now have access to this enormous wealth of information due to the efforts of contributors too numerous to name here. The efforts in publishing this material have succeeded because of the skilled contributions of SAGE's staff. Remarkably, Shirin Parsavand, senior development editor, managed a Herculean feat by helping administer and review the hundreds of entries now featured in the encyclopedia. There is no way to accurately gauge the total number of emails, drafts, and phone calls between Shirin and I over the past few years, but I estimate thousands of correspondences have contributed to the final product. Thanks also go to Carole Maurer, a SAGE development editor, who stepped in gracefully to ensure work on the project would conclude by deadline, effectively and efficiently. Andrew Boney, a senior acquisitions editor with SAGE, helped launch the project in its earliest stages, addressing preliminary questions and guiding the process to the point where contributors could begin their work. And Leticia Gutierrez, editorial systems lead, helped administer agreements with authors and managed troubleshooting issues in the administration of submissions.

A line-up of world-class scholars have contributed their expertise to this project as members of the editorial board. Colleagues at the University of Las Vegas, Nevada, contributed several of the entries published in the second edition, and four of

them—Stephen Bates, Benjamin Burroughs, Lawrence J. Mullen, Kevin L. Stoker—both authored entries and served in advisory roles, helping to determine the general scope and composition of the second edition. Scholars at other universities—Maurine Beasley and Linda Steiner at the University of Maryland, College Park, Michael D. Murray at the University of Missouri, St. Louis, and Karin Wahl-Jorgensen at Cardiff University, Cardiff—provided a balanced approach to the overall breadth and depth of the encyclopedia.

As you can likely imagine, compiling a set of volumes of this scope and depth on a subject as complex as journalism required a tremendous

amount of collaborative work. Knowing the very human nature of journalism, changes in our understanding and practice of the craft will occur naturally, as they did between publication of the first edition and this one. It is my hope that everyone involved in the production of the *Encyclopedia of Journalism* will have confidence that we will have laid the foundation for—in time—a third, fourth, and subsequent editions. Thank you to everyone who has contributed to this endeavor.

Gregory A. Borchard
University of Nevada, Las Vegas

ABC News

ABC News is the news division for the American Broadcast Company (ABC), which the Walt Disney Company owns. Disney acquired ABC/Capital Cities, Inc. for \$19 billion on July 31, 1995. Capital Cities had owned ABC since 1986, when it purchased the network for \$3.5 billion. At the time, it was the second largest corporate merger in U.S. history. It combined the power of Disney's film studios with ABC's broadcast channels, including ESPN. Revenue jumped more than 70% over the next decade, including a 50% increase in earnings per share. This entry discusses the origins of ABC News, the development of TV news, ABC's venture into the digital arena, an attempted merger with CNN, and ABC News Live.

Origins

ABC news started from the National Broadcasting Company (NBC) as the NBC Blue radio network in 1943. NBC was owned by the Radio Corporation of America (RCA) and operated two radio networks: NBC-Blue and NBC-Red. The Federal Communications Commission (FCC) ordered RCA to sell one of its radio networks because of the monopoly they shared. The case went to the Supreme Court, which sided with the FCC. RCA sold NBC-Blue to Edward J. Noble for \$8 million, and it was later rebranded with the ABC name in 1945.

One of their most popular radio personalities was Paul Harvey, who started working at ABC affiliate WENR in Chicago in 1944. His program, *Paul Harvey News and Comment*, became popular and became nationally syndicated in 1951.

ABC radio has provided services for thousands of radio stations throughout the United States. Starting in 1968, they offered four different programming services, providing content to radio stations. By 2015, ABC provided content to approximately 2,000 radio stations with a reach of 50 million listeners each week.

Development of TV News

As the media industry dove into the world of television, ABC had financial difficulties in keeping up with the TV race. Paramount Theaters took over the company in 1953 and later changed its name to American Broadcast Companies in 1965.

John Charles Daly anchored ABC's television newscasts from 1953 to 1960, serving as the network's vice president in charge of news, special events, and public affairs. Daly was a veteran journalist before going to ABC, working for both NBC and CBS radio. While he was the face of ABC News, he was not limited to the network. Daly hosted the television program *What's My Line* on CBS and also filled in on *The Today Show* on NBC. He left ABC on November 16, 1960.

ABC News had a tough time matching up with CBS and NBC, in part due to its lack of television

affiliates compared to the other two networks. By the 1970s, the network played catch-up as newer affiliates helped expand the network's reach in the United States.

After years of being in third place, ABC took a chance on hiring Boone Arledge as president of ABC News in 1977. Because Arledge was known for his efforts in creating Monday Night Football and Wide World of Sports for ABC, there were fears that his history of creating flash for successful sports programs would ruin journalistic integrity for their news operations. However, ABC needed to attract more viewers, as it was drawing less than half of the audience of rivals NBC and CBS.

Arledge received credit for reinventing Sunday morning after hiring David Brinkley from NBC in 1978 to anchor *This Week*. Arledge also gave the show a full hour, giving journalists such as Sam Donaldson, George Will, and Cokie Roberts a higher stature and importance in the show itself.

Arledge also led the effort in producing a nightly special on the Iranian hostage crisis in 1979–1980, a new effort in the TV news industry. The success of those specials became the influence for Nightline, hosted by Ted Koppel. He also brought in Diane Sawyer from NBC in 1990, creating a new show *PrimeTime Live*. Arledge's efforts caused ABC News to turn profits of \$70 million in 1990, which made ABC News the first network to achieve that number. Arledge stepped down as president in 1998.

Good Morning America

The longest running program at ABC News is *Good Morning America*, which debuted on November 3, 1975, with hosts David Hartman and Nancy Dussault. The program replaced the short-run show *AM America*, which lasted less than a year on ABC. It was originally part of the company's entertainment division with the hosts sitting on a couch rather than a news desk. *Good Morning America* was expected to rival *The Today Show*, which had long had a stranglehold on morning news audiences for 20 years.

In just four years, the program overtook *The Today Show* in the ratings. ABC also invested in taking the show around the world for big events, including the 1984 Winter Olympics in Sarajevo

and the Summer Olympics in Los Angeles later that year.

By the 1990s, *Today* regained the top spot in the ratings war and did not lose it for another 16 years. Regardless of the popularity of then-anchors Joan Lunden and Charles Gibson, the show was not able to overcome the tandem of Matt Lauer and Katie Couric at *Today*. Critics claim GMA was also slow to adapt to the 24-hour news cycle. The show moved to ABC's news division in 1995. GMA regained the top ratings spot in 2012 and has been in a constant ratings battle with *Today* since then.

20/20

Arledge created the newsmagazine 20/20 to rival 60 Minutes on CBS. The first episode aired on June 6, 1978, with hosts Harold Hayes and Robert Hughes, both of whom were respected magazine editors. The program had a rough start, with New York Times TV critic John O'Connor calling it pointless and dizzyingly absurd. Immediately afterwards, Arledge replaced Hayes and Hughes with Hugh Downs, who was a former anchor with *The Today Show* on NBC. He anchored the show solo until Barbara Walters joined as a coanchor the following year. The duo remained cohosts of the program until Downs retired in 1999. Other notable anchors who have been with the show include Sam Donaldson, Connie Chung, John Miller, John Stossel, and Chris Cuomo. As of 2021, anchor David Muir has been with the program since 2013. Anchor Amy Robach has been with the program since 2018.

World News Tonight

World News Tonight was launched in its current format in July 1978. The roots of the program originate from *John Daly and the News* in 1953. Arledge made the change after the nightly network newscast had consistently ranked third among the network newscasts. Veteran journalist Frank Reynolds was named the lead anchor for the new format and held that title until he died of bone cancer in 1983.

Following Reynolds' death, Peter Jennings was named main anchor in September 1983. He had

been a coanchor for *World News Tonight* since 1978, reporting from London. Jennings had been with ABC since 1965, when he anchored *Peter Jennings with the News*, a 15-minute nightly newscast. He became the youngest network news anchor at the age of 26, but struggled to compete with veteran personalities such as Walter Cronkite and David Brinkley. After three years, he became a foreign correspondent before returning to the United States in 1974 to anchor the morning program *AM America*.

In 1984, the program's name became *World News Tonight with Peter Jennings*. Jennings held the role until April 5, 2005, when he took a leave of absence due to lung cancer. He never returned and died later that August. At one point during his tenure, Jennings drew an average audience of nearly 14 million people each night in the early 1990s. He had an 8-year ratings winning streak over CBS and NBC during that time period as well. However, the program fell behind NBC Nightly News for a decade prior to Jennings' death.

Bob Woodward and Elizabeth Vargas succeeded Jennings, holding that role for just a short time. Woodward was seriously injured from an explosion in Iraq on January 29, 2006, and never returned to the anchor desk, although he did contribute as a reporter after a lengthy recovery period. Vargas went on maternity leave in May 2006 and resigned from her position.

Gibson took over in 2006, which gave the network a familiar face to lead the program. Gibson had been a coanchor for *Good Morning America* from 1987 to 1998 and had filled in on occasion for Jennings during his health issues. Soon after, the program name changed to *World News with Charles Gibson*. He stayed in that role until retiring in 2009.

Diane Sawyer, who had been a coanchor for *Good Morning America*, replaced Gibson in 2009 and remained in that role until 2014. Muir, who was a coanchor for *20/20*, took over after Sawyer stepped down to do special projects.

Digital

ABC's venture into the internet came after its initial failed attempt to organize a 24-hour cable news channel, after NBC launched the MSNBC network

in 1996. Instead, the company decided the web would be the source for its 24-hour coverage.

ABCnews.com launched on May 15, 1997. It was a joint venture between ABC News and Starwave Corporation. Paul Allen, cofounder of MicrosoftStarwave Corp., owned Starwave Corporation. The company had already been successful behind other popular websites, including ESPN Sportszone, which was the web service for ESPN, Inc., that would also be featured on the ABCnews.com website.

The launch came 2 months after Disney acquired one-third of Starwave for just under \$100 million and also took over its board. In addition, Disney had the option of buying the remainder of the company within the next 5 years.

The launch did have some hiccups though. At a news conference on the launch date, executive Jeff Gralnick did a demonstration of the features of the website. The Java headline reader function did not work during the demo for much of its first day after going live.

News content featured columnists and current correspondents from ABC News. Breaking news content on the site relied mainly on Associated Press and Reuters news wire services, with a team of 100 reporters updating stories as they developed. The initial plan was to also feature content from its 200+ affiliates around the country. ABC News initially partnered with TheStreet.com to provide information on the stock market.

Video clips in the initial stages were cut down dramatically because consumers used dial-up internet service providers, and long videos would take too long to download and watch. However, as bandwidths increased and the introduction of faster internet speeds were developed for homes and businesses, ABC News reached upwards of 129 million people across its digital platforms on a monthly basis by 2015.

ABC News developed a partnership with iTunes in 2005 to become the service's recognized news provider for podcasting. Initial podcast offerings included highlights from Nightline, entertainment news, mixes of news headlines, and news wraps for the Hispanic community.

ABC News Now launched in 2004 to provide 24-hour news initially on a digital subchannel, but later expanded to the internet. The experiment provided election coverage and allowed the

network to provide expanded coverage without having to worry about confined time periods on television. Anchor Peter Jennings had been frustrated with the lack of convention coverage and offered to anchor them from start-to-finish when he was not anchoring his television newscasts. Even though the network expanded to include the United Kingdom, Spain, Germany, and Belgium, it only lasted a few years.

ABC News partnered with Yahoo in 2011 to gain more online visibility. The partnership expanded in 2015, allowing cross-promotion for Yahoo's digital magazines and other segments on ABC's *Good Morning America*, while ABC's entertainment programming would be featured on Yahoo's site. Yahoo also featured ABC News content more often on its network, resulting in more viewers across a wider web audience. *Good Morning America's* web page was hosted on Yahoo until 2018, when ABC News shifted its arrangement with the morning show to become strictly a content partnership.

ABC News partnered with Univision in 2013 to launch Fusion TV, a news and information channel that was initially geared toward Latino bilingual adults, a demographic that ABC valued. Univision, which was in charge of content for the new channel, quickly switched gears to appeal to all ethnicities, rather than a focus on Latinos. It also took on an edgy political tone, which reportedly made executives at Disney uncomfortable. The partnership lasted until 2016.

ABC News acquired FiveThirtyEight from ESPN in 2018. FiveThirtyEight was a data journalism organization that ESPN acquired in 2013. Under ESPN, FiveThirtyEight attracted millions of visitors and was also named "Data Journalism Website of the Year" by the Global Editors Network in 2016. The goal for the acquisition was to enhance political coverage with statistical analysis and data visualization for ABC News and its partners.

Attempted CNN Merger

In 2002, Disney and AOL/Time Warner had discussions about merging ABC News with CNN. The move could have saved tens of millions of dollars on both sides by combining their news forces. However, the two sides halted the potential

merger in February 2003 after failing to reach an agreement on how the complicated relationship would work in regards to control. Plus, AOL was dealing with its own internal issues regarding internet service, which was a core service for them at the time.

ABC News Live

More than 20 years after ABC News had initially thought about launching a 24-hour network of programming, it made its next attempt in 2018 with the launch of ABC News Live. The 24/7 live stream was launched on the Roku Channel and featured breaking news and live event coverage. At the time, it was the first live feed to debut on the channel. ABC News correspondents provided content. The feed also carried the same programming as the ABC TV network during breaking news events. Contrary to goals of other 24-hour news networks, the goal of ABC News Live was to provide on-the-ground coverage, rather than news analysis from anchors and guests.

ABC News Live later expanded to Hulu subscribers in March 2020. Hulu, which is also a Disney company, claimed that more than 45% of their subscribers had either cut the cord for cable or satellite service or had never had cable. It was an opportunity for their subscribers to have access to a 24-hour news service without any additional cost. ABC also launched new apps for Android TV, Amazon Fire TV, and Apple TV that same year. ABC claimed that it would air up to 18 hours of live and original content daily, which included newscasts, documentaries, and other original programming.

ABP News

ABP News is a Hindi television news channel and website that is one of the more prominent privately owned satellite television channels in India.

Its history of ownership and collaborations not only reflects India's shift from public broadcasting to private news media but also demonstrates conflicts between the state and media over information networks. Since the start of the 21st century, the number of independent news media outfits in India has shown tremendous growth, even though the 2010s also witnessed the state exerting more pressure to consolidate this apparently diverse landscape in its favor. This entry discusses the history of ABP News and its place in the Indian television news landscape.

ABP News, in its current form as a free-to-air Hindi news channel, only came into being in 2012. Prior to the 21st century, news production in Indian television was entirely controlled by the public broadcaster, Doordarshan. One of the first and most credible private news media companies, New Delhi Television Ltd (NDTV), itself began in 1988 as a content provider for Doordarshan. The gradual expansion of the private news landscape allowed NDTV to start its own channel in 1998, through a partnership with Rupert Murdoch-controlled STAR India. The relationship between NDTV and STAR lasted only for about 5 years, until 2003.

In 2003, STAR News began collaborating with Bengal's reputed Ananda Bazar Patrika (ABP) Group on a Hindi news service that was renamed ABP News in 2012. The flagship newspaper of the ABP Group, *Anandabazar Patrika*, has been published since 1922, while its English language daily, *The Telegraph*, began publication in 1982. Apart from the two dailies, the group publishes numerous periodicals in Bengali and English and runs a market-leading Bengali publishing business, multiple news channels, a matrimonial business, and several mobile and Internet properties.

STAR's joint venture with the ABP Group was a result of a government cap limiting foreign equity in the news business to 26%, which was later raised to 49%. STAR News was run by Media Content and Communications Services Private Ltd (MCCS), a joint venture of STAR and ABP, in which the former was the foreign and minority partner. STAR News was considered a more credible and established brand than its sibling channels, STAR Ananda (Bangla, now ABP Ananda) and STAR Majha (Marathi, now ABP Majha). The branding preference for ABP

News over Telegraph or Ananda was on account of the worldwide popularity for three-letter brand titles in television news. ABP News, however, persisted with the legacy of STAR News as if nothing had changed except the name and the logo. The shows, anchors, design, tonality, decibels, or style did not change to explicitly maintain continuity.

While Indian news channels have featured an increasingly hawkish political slant and partisan news anchoring, ABP News was situated on the softer edge of the spectrum of sensationalism, before a more hawkish government elected to office in 2014 tipped the balance at the network in favor of a more partisan, sensational tone. In comparison, NDTV India has been known for relatively credible journalistic analysis and reasonable reportage, while channels such as Zee News, India TV, and Aaj Tak occupy the other end of the spectrum. On the other hand, ABP Group's English daily, *The Telegraph*, has been the most consistently critical daily print publication since 2014. Contrary to *The Telegraph*'s Kolkata-centric readership, however, ABP News has been a key driver of the ABP Group's national ambitions. That is why, ABP News draws more from the Hindi News cabinet (Aaj Tak, CNN-News18, Zee News, India TV, and NDTV India) of its rival channels and networks than from its own business group's more regional political slant.

One of the ways in which the Indian government controls the news media is by suffocating its advertising revenues, since advertising from political campaigns by the ruling party and requests for proposals by companies vying for government contracts are significant sources of revenue for news organizations. In 2019, for example, the Indian government froze advertisements to Times Group, ABP Group, and *The Hindu*, which were seen to be critical of the government on various fronts. While the dependence on advertising revenues may be higher in print publications, the message about the government closely watching news reporting also is absorbed by television channels that need ruling party spokespersons for primetime debates, and ministers as well as high-ranking government officials for various media events conducted by all news channels. The events are not only

strategic occasions for brand-building, they also bring in new collaborators from the government as well as the private sector. As highly profitable ventures, these events necessarily require access to the government and the ruling party.

Only a year before the freeze in advertisement funding, ABP News had made vital political "adjustments" in its positioning, by ousting managing editor Milind Khandekar and popular anchor Punya Prasun Bajpai. Another senior news anchor, Abhisar Sharma, was also asked to go off-air and was sent on a long leave before he resigned. Sharma had been highly critical of the government in his video blogs, and as of 2020 both he and Bajpai were working as freelance journalists. Bajpai's show *Master Stroke* was a particular bone of contention, since he had exposed the government's claims of employment generation through its skill-development program.

Bajpai showcased a female farmer from Chhattisgarh, Chandramani Kaushik, who had declared in a public video conference with the prime minister, that her income was doubled after diversifying her crops, and switching from cultivating rice to growing custard apples. However, appearing on Bajpai's show, she admitted that she was tutored by the ruling party officials to make the claim, alongside other female farmers. The channel stood by the story, instead of issuing an apology in response to public criticism of the story by some ministers. However, it suffered a prompt boycott by the ruling party, which stopped sending any spokesperson or a prominent party face to its debate shows. Soon after the story, it was also reported that during primetime shows, the channel's transmission signals began getting distorted, as had earlier been reported about NDTV India—the only Hindi news channel consistently critical of the government.

The problem with transmissions was restored soon after the resignations, which reoriented the relations between the government and ABP News. However, as discussed earlier, the government's animosity with ABP Group continued, particularly with respect to *The Telegraph*, which remains a marginal English daily in comparison to its northwestern counterparts—*The Times of India* and *Hindustan Times*. In fact, one could argue

that ABP Group remains a regional institution of much credibility, but its national ambitions are manifested in ABP News, which has adopted a tone of support for the Indian government that has become widespread among Hindi news outlets.

To a large extent, then, the template of ABP News continues to be borrowed from its STAR News vintage and the standard operating procedures of Delhi-based national news studios. The ABP Group's limited expertise with Hindi-speaking regions of the north and west, where the core audience targeted by advertisers of the channel resides, introduces further asymmetries between the company's legacy business and its more recent foray in television, but the interest-free loans from the company have been vital in the growth of the television channel.

In 2020, the ABP Group completed the first year of ABP Ganga, another Hindi news channel dedicated to the states of Uttar Pradesh and Uttarakhand. Presumably, while ABP News addresses a much wider, national, Hindi-speaking audience, ABP Ganga addresses a Hindi-speaking region, including every district and town of Uttar Pradesh, which is not only the most populous state in India, but widely understood to be the political backbone of north India. ABP Ganga, therefore, gives an indication of the arenas of growth ABP Group's Hindi news production seeks to expand across.

ACCESS TO MEDIA

Media access means the opportunity and ability to use media technology for the production, distribution, and reception of mass communication intended for public audiences. In most commercial media renderings and politician pronouncements, media access is restricted to *reception* of analog or digital transmissions, including Internet sites. Even the United Nations Declaration of Human Rights, Article 19, which declares access to the “means to communicate” a human right, emphasizes receiving information, with only passing references to citizen participation in media production.

Media access provides a measure of democracy and entails more than viewing or listening. To maximize democratic participation by diverse publics, individuals and groups must have full access to the technologies necessary for the production and distribution of mass communication, including the means for print, broadcast, film, and digital production and dissemination of messages and meanings. Specifically, media access entails opportunities for video and audio recording, including access to sound and visual editing equipment, studio space, portable recording equipment from microphones to cameras, and the ability and resources to broadcast to mass audiences. Media access means adequate training in production techniques and practices.

Full civic access to media also requires space for collective discussions on programming needs, criteria, and scheduling to maximize contributions from multiple viewpoints and diverse social groups, communities, ethnicities, genders, and more. To assure wide reception, media access needs ample broadcast spectrum space, which is publicly owned but governmentally administered in most nations.

Media Control

History shows media as a primary means for information, social influence, and political

control. From ancient Rome to contemporary China and Turkey, from World War II censorship to contemporary media repression in Egypt, Saudi Arabia, and Brazil, institutions and governments have sought to control the production and reception of information and entertainment. Even in ostensibly democratic nations such as France, Britain, and the United States, most media production is not available to the public. Civic organizations and community groups, whether ethnic or national minorities, labor, indigenous, youth, women, and other non-elite social groups, have very little to no access to technologies needed for the production and dissemination of mass communication. Access to media production technologies and media distribution channels is almost exclusively under the control of a handful of consolidated national and transnational media corporations.

In the United States, Comcast, Disney, Fox, Gannett, iHeartRadio, and a half dozen other firms dominate the production of news and entertainment programming. In Europe, Bertelsmann, Burda, Bauer, Canal+, BSkyB, Daily Mail, Media-set, and a few other national and transnational media groups produce and distribute most news and entertainment products across the continent. Increasingly, banks, investors, and private equity funds (such as KKR and Alden Capital) are also buying into major commercial media, further restricting media access to leveraged financial interests. Elsewhere, dominant commercial media such as Rede Globo (Brazil), Televisa (Mexico), Naspers (Southern Africa), and Reliance (India) control the airwaves and predominate on national Internet sites.

Certainly, access to information and entertainment is abundant globally. Providing access to information about science, technology, and politics to the world's billions is essential. However, reducing media access solely to *reception* of the "information superhighway" as the pathway to education and employment (as championed by former U.S. Vice President Al Gore) confines citizens to *spectators* and *receivers* of communication produced by others. Without access to media production, communication as a human activity can be little more than advertising, proselytizing, and propaganda—well-intentioned or not.

Public Service Media

In most nations, public service broadcasting offers modest and benevolent public-oriented educational and entertainment programming. Yet, even a public broadcasting that emphasizes its public service still leaves citizens and the public in general as *receivers* of communication—dependent on news and entertainment produced by elite gatekeepers who have direct access to production and distribution. The British Broadcasting Corporation (BBC) in the United Kingdom, Germany's ARD (*Arbeitsgemeinschaft der öffentlich-rechtlichen Rundfunkanstalten der Bundesrepublik Deutschland*—Association of Public Broadcasting Corporations in the Federal Republic of Germany) and ZDF (*Zweites Deutsches Fernsehen*—Second German Television), Italy's RAI (*Radiotelevisione Italiana*), Japan's NHK (*Nippon Hōsō Kyōkai*—Japan Broadcasting Corporation), and India's Doordarshan maintain some of the largest viewing and listening audiences in their own nations and globally. In most cases, mandatory public fees provide the financial resources and afford public service broadcasters some degree of independence from their respective governments. In the United States, in contrast, Congress determines the level of federal support for public media such as National Public Radio (NPR) and Public Broadcasting Service (PBS). Public service broadcasters in the United States have increasingly turned to commercial underwriting and voluntary donations from listeners and viewers, pushing the public media toward entertainment, apolitical programming, and news reports that largely echo government policies and sources.

In Europe meanwhile, free trade agreements have required governments to reduce their support for public broadcasting as an unfair subsidy restricting the free flow of commercial broadcasting. BBC, and other public broadcasters in Europe, faced with cuts in federal funding have turned to commercial enterprises, such as BBC America. Others, like TF1 in France, have found private partners.

Globally, public access to media production has been threatened by technological innovation and national governments enforcing austerity cuts on public services. About half the world has

no access to the Internet, and digital media have limited mass distribution. Not surprisingly, the mass production and distribution of media messages and formats (including on the Internet) remain dominated by commercial media, while public service broadcasters normatively and ideologically conform to dominant media frames and agendas set by those commercial interests and government policies influenced by commercial media lobbyists. In the 21st century, media access to production and distribution by major corporations results in standardized genre (e.g., talk shows, game shows, situation comedies, dramas about professionals, and infotainment news) with public service broadcasting featuring nature, history, and music documentaries—all intended to attract audiences to be sold to advertisers. Public access to media technology for production of noncommercial programming and stories by citizens is miniscule in comparison.

One significant contrasting example is public service broadcasting in Venezuela since 2004. Public media were dramatically expanded following the business coup attempt against President Hugo Chavez in 2002. VTV, the government-run public service television airs educational programming, news and information, and even some telenovelas. ANTV broadcasts news and information from the National Assembly. Three major public broadcasting stations—ViVe, TVes, and Avila TV—feature community-produced videos and news, drama, music, and investigative reporting. The YVKE Radio Network includes 10 public radio stations. These noncommercial media receive substantial financing from the government's Social Fund. They are each independently run outside government direction, oversight, or even approval—highlighted by several shows highly critical of the government.

Although Venezuela's public media do not attract the most sizable audiences, their diversity of programming, independent and investigative news reports, and their community-produced cultural offerings of theater, music, and dance express the best in public service. In addition, Venezuela hosts Telesur (Television of the South), a cooperative noncommercial satellite television venture of Venezuela, Argentina, Uruguay, Cuba, and Bolivia with 12 Latin American bureaus. Still, even when

public service media inspire and inform millions of viewers and listeners, those audiences remain receivers—not producers, not creators of media or communication.

Public Access Radio and Community Media

Direct media access by the public does exist in many nations, albeit on a limited scale. In the United States, for instance, some 2,000 low-power FM radio stations are licensed to broadcast at 100 watts to mostly rural small towns across the country. The National Federation of Community Broadcasters and the Grassroots Radio Coalition coordinate and share programming among dozens of larger community radio stations. The most successful public access media may be the Pacifica Radio Network, which has five independent, noncommercial, listener-funded stations in Berkeley, California; Los Angeles; New York; Houston; and Washington, DC, as well as more than 100 community radio affiliates across the United States.

Since its founding in 1983, the World Association of Community Broadcasters (in French, *AMARC—Association Mondiale Des Radiodiffuseurs Communautaires*) has grown to over 3,000 member stations in 100 countries broadcasting, sharing, and advocating for public media access and international collaboration in participatory broadcasting practices and policies. Internationally, radio technology affords more media access to the public due to its relatively low cost of production and distribution. For public reception, radio is more accessible because literacy is not necessary for listening, while relatively inexpensive transistor or even nonbattery crank-generated radio receivers make reception possible almost everywhere. Thus, across Latin America, Africa, and South Asia access to low-technology community radio provides some opportunity for public media production and distribution with the potential for wide reception.

One hallmark of media access through community radio, including even the larger Pacifica stations, is the preference for media production by listeners, community members, and individual broadcasters, who create and air their

programming to listeners in the broadcast footprint and through shared exchanges among community radio networks and coalitions. Community radio broadcasting provides multiple models for participatory public media access to production and distribution, including listener-directed programming decisions, listener and community-based technical training and producer development, and direct democratic communication and decision-making among and by listeners-as-programmers.

Media Access in Southern Africa

Underscoring the essence of media access, community radio's defining feature is that senders are also receivers. In some regions, government authority explicitly recognizes community broadcasting as a third sector, supplementing commercial media and public service media. The South African Independent Broadcasting Authority defines community access media as those that reach specific geographic or collective interest, are nonprofit, and include community participation. A leading postapartheid example is Bush Radio, which has been broadcasting in English, Afrikaans, and Xhosa from Cape Town since 1993. In West Africa in contrast, radio station owners include religious groups proselytizing and individual commercial interests—essentially limiting public media access to “community” broadcasting. Originally sponsored by UNESCO, Katutura Radio in Namibia demonstrates fuller media access with its wide citizen participation in production and broadcasting. New national networks advocating public media access, including the Kenyan Community Media Network and the South African National Community Media Forum, have been petitioning for more supportive legislation and policies.

Europe's Uneven Media Access

Despite European countries' long history of public service broadcasting with significant national funding, the availability for public access media was slow to develop. In 2009, following a resolution by the European Parliament, the Council of

Europe declared community media essential for promoting social cohesion and intercultural dialog, but implementation remains uneven. Community radio in Germany, often called *free radio*, goes back to antinuclear activists launching Radio Dreyeckland in Freiburg in the late 1970s. Since then, several states have licensed “open channels” as forms of noncommercial, nongovernment media. Yet, regional radio authorities administer and control these channels, essentially limiting public access.

France has an advanced community radio system with more than 600 community stations. Although many are Catholic broadcasters, the majority promote community dialog, fight ethnic discrimination, and advocate on environmental issues and local development. Funding for community radio comes from taxes on commercial station advertising revenue. The Netherlands and Belgium have contrasting media access structures: The Dutch have some 300 community stations (*locale omroepen*), while next door in Belgium the government only licenses for cultural programming, marginalizing full public access to broadcasting.

By 2010, the Office of Communications in Britain had issued more than 200 community radio licenses. All licensed stations demonstrated evidence of public service to their community, a not-for-profit status, accessibility for people living within the area, training and significant community participation and engagement in program production. British media laws have an expansive view of community radio, providing for both communities of interest and of geography. For example, there is Forest of Dean Community radio, the only local station broadcasting throughout the Forest, a remote region in the west of Britain. Takeover Radio in Leicester is the first children's station in the United Kingdom. In London, there is a licensed community station in West London serving the Punjabi-speaking population (Desi Radio) and an experimental sound, art, and culture station in Central London (Resonance FM). Some stations emerged from long-running community organizations. New Style Radio in Winston Green, Birmingham, is a project of the Afro-Caribbean Millennium Centre, formed in the 1970s as a cooperative for Black youth and which

later became a multifaceted now community resource center.

Following the fall of the Soviet Union, Eastern Europeans anticipated a democracy with increased communication rights such as access to information and freedom of expression—independent not only from government but also from commercial control. Community media offered the clearest access to media and communication rights. In fact, community media had played an important role during and after the wars in former Yugoslavia in the 1990s, serving as an important platform of discussion, creating a sense of belonging. Community media in Bosnia, Croatia, and Serbia were also open spaces contributing to social transformations.

In the post-Soviet era, however, community media have been sidelined in most of Eastern Europe. Until recent political changes, 40 community radio stations allowed media access in Hungary with some 30 in Poland. Now, in all 20 Eastern European countries, from Albania to the Ukraine, legal community media and public media access is all but nonexistent—illustrating how media access indicates the extent of democracy and a citizen's right to communicate.

Across Southeast Asia, including the Philippines and Indonesia, hundreds of local newspapers and low-power radio stations are community based, but in most cases without community control or participation. Politicians and private owners maintain exclusive access to most stations. These media serve as one-way channels for government information, advertisements, and religious propaganda. Even though they serve limited geographical communities, they do not represent media access. Rather, print publications and folk media often dominate other media in many local communities. Publications range from the blackboard news bulletins, to mimeographed pages, to tabloid-sized newspapers—but provide media access for local citizens who write, interview, and report news and information to be shared.

India has a similar trajectory with the potential for more public media access. After Supreme Court decision in February 1995 that “airwaves are public property,” a national campaign to legitimate community radio began. Until 2006, only

educational institutions were allowed to set up campus radio stations having a transmission range of 10–15 kilometers. With India's 2006 Community Radio Guidelines, nonprofit organizations, agricultural research institutes, and schools were licensed for community radio stations that included local communities in the content production process. Progress has been slow: Only about 200 media access radio are licensed in India. (Of note, Nepal has around 475 radio stations even though they do not have community media policies.) Importantly, the Information and Broadcasting Ministry only permits community radio to air news bulletins translated into the local language or dialect and non-news like traffic and weather updates. Guidelines essentially compel community radio stations to broadcast for the government, not the community. A few stations have transgressed to provide wider public media access. For instance, since 2008, Sangham Radio broadcasts for 2 hours daily in Telugu to 150 villages in the Telangana region. With UNESCO support, rural women produce and air music, farming news and advice, and a call-in session for villagers to speak directly and without censorship to all listening. Radio Benziger in Kollam has also enacted participatory production practices with community decision-making on programming, further pressuring the Indian government to allow more media access.

Such initiatives for media access have become more organized and deliberate. The South Asia Network for Community Media (SANCOM) was formally launched on February 13, 2015, at the World Radio Day event in New Delhi, India. The event and network were organized jointly by UNESCO and the Commonwealth Educational Media Centre in Asia. SANCOM advocates for expanding public media access across South Asia through workshops, conferences, and policy proposals to national governments.

Public Access Television

Given that television requires more technology, more expertise, and more funding, it is not surprising that public access to television broadcasting (terrestrial, cable, and satellite) is more limited. One exemplary media access model for television

comes from the United States. Public access television was established in the United States during the 1970s and public, educational, and governmental (PEG) cable television organizations and community media centers began in 1984—both of which feature locally produced programming and appear as local free speech media zones, giving access to public communication, comment, and opinion.

The Cable Communications Policy Act of 1984 included a public interest requirement that to be awarded local franchises cable companies must set aside cable channels, facilities, and equipment for public access, educational, and government use. In addition, cable companies were required to pass along customer service fees to the local PEG channels. In some cases, such as in Santa Clara and San Mateo counties on the San Francisco peninsula, local PEG media became quite robust and vibrant in providing significant community access to production and airing of programs. The Mid-Peninsula Media Center in Palo Alto broadcasts on six community cable channels. The Media Center trains local citizens in video and audio production skills and provides paid-professional and volunteer taping and broadcasting services to local groups, including schools, city councils, and small businesses for education, youth, culture, government, and arts programming. With annual revenues of less than \$700,000 in 2020, the Media Center services local government, educational, and business contracts, coordinates a wide range of workshops, offers technical training, and broadcasts citizen- and viewer-produced programming, as well as producing and airing shows by media center staff. In 2015 the cable franchise paid \$300,000 in franchise fees; in 2018 the payment was cut to \$62,000 while the cable company kept the subscriber fees intended for PEG broadcasting. Arbitrary funding cuts, without any government oversight, threaten the future of public access television in the area. Cable companies are aggressively pursuing restrictions on public access television across the United States.

Elsewhere, public access television is somewhat less precarious—notably in Scandinavia, Western Europe, Canada, and Australia. In most countries public-access television channels are broadcast on

cable; in Australia, Denmark and Norway broadcasting is more common in UHF and digital. Ironically, most “public access” channels outside the United States are for-profit operations, which limits access to those who can pay.

Media Access as Democratic Eruption

Because media access is so intimately tied to democratic participation, media access is not only a measure of democracy but also makes media primary public sites for debate and discussion. Some of the most dramatic and significant instances of expansive citizen access to media production and distribution occur at times of social protest and collective demands for increased democracy and human rights. From Bolivian miner’s community radio in the 1950s to community radio and television in Venezuela and Bolivia in the 2000s, social movements that successfully shift the social relations of power have accordingly opened media to public participation and sites for advancing civic participation and democratic decision-making.

Democratic moments of rupture in societal norms unearth interconnections between media and society that are often obscured during periods of social stability or political repression. In the 20th century, turmoil in Latin America created openings for significant citizen media access.

To different degrees, governments across Latin America have created or allowed openings for citizen access to media communication, reflecting disparate social relations of power. In each case, the social relations of power reflected in government policy have resulted in changes in media political economies and public access to communication. Political power has largely determined the extent of media access by the public.

Media Access in Bolivia

One dramatic instance of public media access occurred in Bolivia in the 1950s. As part of a massive social and political uprising for democracy, dozens of rural communities created their own media access, collaboratively building their own radio production and broadcast. Nearly 30 radio

stations (from 200 watts to 200 kilowatts) were built, managed, and funded by Bolivian tin miners in the 1950s, 1960s, and 1970s, in the desolate Altiplano region. Each station had its own style, created by and for the culture of its mining community. With access and control over media production, citizen broadcasters aired educational programming, including radio plays, theater, music, and poetry. They took microphones to the mines, markets, churches, and sports fields, inviting all to talk.

By the 1990s, as globalization of production expanded and Bolivia's tin mines closed, the social basis and political conditions for public media access declined in the region but reappeared as an outcome of the radical tumult against privatization at the end of the 1990s. Following the 1999 Cochabamba Water Wars and the 2003 El Alto Gas Wars, the Movement for Socialism won the 2005 presidential election campaign, bringing Evo Morales and other indigenous leaders to power. Media access returned in the 2009 Bolivia Constitution, and the Telecommunications Act, Technologies, Information, and Communication Law of 2011 mandated spectrum access of 33% for state media, 33% for private media, and 34% for community and indigenous media. While the constitutional mandates for media access remain, many of the administrative responsibilities for supporting public media access have been abandoned by the government that forcibly replaced Morales in 2019.

Media Access in Nicaragua

Another historical example of widespread media access developed during another moment of rupture—the 1979 Nicaragua Revolution against the U.S.-backed Somoza dictatorship. The revolutionary changes in Nicaragua in the 1980s were more short-lived than in Bolivia. The sudden triumph brought workers and peasants to political power without much preparation. Only about 50 stations remained after the insurrection, most of them privately owned and none with public media access. As Somoza supporters fled, their radio stations became “community property.”

In April 1981, the public radio network CORADEP (*Corporación de Radiodifusión del*

Pueblo—the Corporation of Popular Radio Broadcasting) was founded, bringing together 16 stations. In many towns, the socially owned community stations became media access by direct democracy, whereby collectives of volunteers and professionals seeking to engage the communities in their regions provided news, information, and entertainment appropriate for the area. Farmers, health workers, soldiers, and educators, acting as community correspondents, reported on what was happening in their communities. To maximize media access, stations set up broadcast booths in town squares and markets so citizens could voice their personal and political perspectives.

In 1990, under the new government of Violeta Chamorro, CORADEP was disbanded, funds for community media were abolished, and most community stations were confiscated and privatized. With the 2006 reelection of Daniel Ortega to the presidency, some initiatives for community media and public media access have returned, but none as successful as CORADEP's public media access.

Media Access in Venezuela

Following the military-media attempted coup against the elected Hugo Chavez government in 2002, the National Assembly passed a Law on Social Responsibility of Radio and Television. The 2004 law established the right to public media access to production and broadcast. The 2006 Partial Reform Law of Radio and TV Social Responsibility furthered media access rights based on active and direct participation in media production. Within a few years, more than 300 FM radio and TV broadcasters were established and licensed. The Venezuelan National Assembly approved additional laws in 2010 and 2012 that expanded media access, supporting some 1,200 community media with increased networking, funding, licensing, and community control. In Venezuela, media access gives citizens the right *and* the means for media production and distribution.

Democratic media access by citizens and community groups is assured by (a) public, collective, social ownership of media broadcasting technology with wide public access to the broadcast

spectrum; (b) community and media workers' control of the means of mass communication; and (c) media content produced by and for community contributors. Media access obtained democracy in action—through organized, engaged, political, and cultural communication by average citizens, youth, women, indigenous, and other constituent social groups—all of whom now have direct access to media technologies, skills, and opportunities for the production and distribution of mass communication. With socially owned media, media access is available to all.

By 2009, community media reached 56% of the population with more than 100,000 community media activists working at hundreds of stations in collaboration with social movements that previously used street media such as murals, flyers, megaphone “radio,” film clubs, and websites. Media access in Venezuela has created participatory journalism and participatory democratic production at public and community media outlets such as ViVe, Avila, Catia TV, and Radio El Negro Primero, reflecting new social relations of production needs or editorial dictates of a market-driven media. One third of media broadcasts in Venezuela are socially owned with licensing collectively held by the media users themselves. These democratically run media are nothing like the vertical broadcasting and control prevalent in commercial media. Communal councils, which operate most community media, are structures of direct democracy by residents, workers, and citizens self-organized at the local level.

Media Access as Democracy

Media access as a vital space for democratic communication is not merely technical or even distributional—it provides a public space for dialog, debate, argument, and interaction among citizens long denied access to the production of politics and culture. In practice, media access must provide a space for production and distribution of communication by citizens to consent and dissent from official and majority voices. For example, media access in Latin America, represented largely by community radio, nourishes and shares diverse languages and cultures. In Ecuador, microphones

transmit Spanish and Quechua, Mixteco and Guaraní, Miskito and Quiché. In Guatemala, 26 languages are spoken, and behind each language is a culture. Many community radio stations have collected the legends and myths of various cultures, their way of cultivation, genealogy, traditional medicine, and other customs, sharing them through programs containing people's testimonies. Media access also allows music cultures to be broadcast more widely. Community journalists and correspondents serve as lifelines of news and information on local and national events. Media access provides the means for democratic community media to cultivate and share cultural experiences with the nation through translation and broadcast.

Almost everywhere, from Venezuela, Nicaragua, and Bolivia to Sweden, Norway, the United States, India, and Nepal, public media access increases communication among and within communities, nations, and diverse social groups. The public's access to media production increases opportunities for representations and expressions by the majority of society—through music, entertainment, and political commentary—as demonstrated by Avila TV, CORADEP, Sangham Radio, Pacifica Radio, and the Mid-Peninsula Media Center, among hundreds more public access media around the world.

ADVANCED RESEARCH PROJECTS AGENCY NETWORK (ARPANET)

The Advanced Research Projects Agency Network (ARPANET) was a computer network that existed between 1969 and 1990. It is considered the cornerstone of the Internet, since the latter mainly came about as a result of a wish to connect other data networks to the ARPANET. Furthermore, the ARPANET introduced many of the technologies associated with the Internet, including democratized information access, email, instant messaging, file transfer via the File Transfer Protocol (FTP), resource sharing, collaborative development, and distributed computing, as well as using software and storing files in the cloud. After the ARPANET first came into wide use in U.S. and European academic communities, many of its technologies became essential to the practice of journalism. For several decades after the ARPANET's inception, photojournalists would use FTP to send digital images back to newsrooms, and the instant messaging and email technologies now considered indispensable to news production and reporting, were originally invented for the ARPANET. Perhaps the most consequential of the technologies first implemented in the ARPANET was *packet switching*, the principle that enables the fast and reliable data connections of the Internet and almost every other data network in use as of 2021. Finally, the many dramatic changes to the news media landscape wrought by the Internet can all be traced back, culturally and technologically, to beginnings associated with its predecessor, the ARPANET. This entry discusses the development of the Advanced Research Project Agency (ARPA), the origins and construction of the ARPANET project, packet switching, email and wireless networking, and the emergence of the Internet.

Envisioning a Network

When the USSR succeeded in launching the *Sputnik 1* satellite into space on October 4, 1957, it convinced United States President Dwight D. Eisenhower that national security was a matter of technological prowess. The first U.S. satellite launch failed spectacularly during a national television broadcast on December 6, 1957, which prompted Eisenhower to take more decisive steps toward regaining the country's technological lead. This led to the formation of the ARPA under the Department of Defense in February 1958. Shortly thereafter, Eisenhower recognized the prudence of keeping space exploration in the civilian domain and transferred the space program to what would become the National Aeronautics and Space Administration. ARPA would concentrate on missile defense and nuclear test detection instead.

In the spring of 1962, psychologist and computer scientist J. C. R. Licklider gave a series of talks at the Pentagon. He was known for his 1960 paper "Man-Computer Symbiosis," in which he argued that the full potential of computing could only be unleashed if all humans could interact directly with computers using somewhat natural language. Licklider believed this could be achieved with *time-sharing systems*. These were large computers shared by several people using simple computer terminals in a principle that was akin to today's cloud datacenters and server architectures. Licklider's talks impressed ARPA's leadership and he was subsequently hired to lead ARPA's first real foray into computing, the Information Project Techniques Office (IPTO). While at IPTO, Licklider began articulating a vision for connected computing. He believed that time-sharing computers could be used as information retrieval and communication devices in networks, enabling users to access resources on several computers from a single point. Licklider would fund initiatives working toward this goal, including Project MAC at the Massachusetts Institute of Technology (MIT), where he had previously held a position as an associate professor. Project MAC, initiated with a \$2 million grant from Licklider at ARPA, hosted MIT's early, significant contributions to artificial intelligence as well as the

construction of MIT's main time-sharing initiative, the Compatible Time-Sharing System.

Testing the Lines

In 1964, Licklider left ARPA for IBM, handing the director reins to his deputy, Ivan Sutherland. Spurred on by ARPA's new director, Charles Herzfeld, Sutherland continued pursuing Licklider's vision. He initiated a project to test whether the telephone system was a viable infrastructure for a computer network that would require long-distance data transmissions. After receiving a project proposal from Thomas Marill at the time-sharing systems company CCA, Sutherland called upon his former PhD classmate at MIT's Lincoln Laboratories, Lawrence G. "Larry" Roberts. Sutherland asked him to contract with Marill through Lincoln Laboratories, where Roberts still worked. The goal was to connect the large TX-2 computer at Lincoln Laboratories to a similarly large computer on the other side of the country, the Q-32 at Systems Development Corporation in Santa Monica, CA. Roberts and Marill managed to connect the two machines, which was an achievement in itself, since it was extremely uncommon at the time for two computers of different makes and models to communicate with each other. The experiment began in July 1965 but was considered a failure because of the high noise level of the telephone network and its propensity for data congestion. The two researchers concluded that the system resources required at each end, as well as the problems with the telephone lines, simply made this method too slow and unreliable to be used for networking in practice.

Later in 1965, Sutherland joined the faculty at Harvard, leaving Robert Taylor in charge of IPTO. With strong support from ARPA director Herzfeld, Taylor accelerated the work toward Licklider's network vision. The interconnection of ARPA-funded time-sharing computers finally became its own project in 1966, and Taylor began looking for someone to manage the project. Although he was initially reluctant, Roberts eventually accepted a position as chief scientist at IPTO, and began working on what was then called the *ARPA Network* in early 1967.

Deciding on Packet Switching

Upon arrival at ARPA, Roberts began gathering a group of experts who would meet regularly throughout 1967 to design the network. Among these experts was Roberts's former PhD colleague at MIT, Leonard Kleinrock, who had joined the computer science faculty at the University of California, Los Angeles (UCLA). In his dissertation work, Kleinrock showed mathematically that distributed data routing could achieve the speed and data throughput that Roberts was aiming for. The group was also joined by Wes Clark, who was Roberts's, Kleinrock's, and Sutherland's advisor at MIT. Clark suggested to Roberts's group that they let small computers act as "translators" for each of the large computers and let them control the data routing instead of leaving both those tasks to the large computers. This gave rise to the idea of the Interface Message Processor (IMP), the smaller computers that essentially became the first network routers.

Yet, the challenges of slow speeds and congestion in the telephone network still remained. In early October 1967, Roberts presented the ARPA network concept as the "ARPA net" at the ACM Symposium on Operating System Principles conference in Gatlinburg, TN. The results of a computer networking experiment performed by British researcher Donald Davies and his team at the National Physical Laboratory in the United Kingdom were presented at the same panel. Davies's solution to the speed and congestion challenges was *packet switching*, a principle he initially thought he had come upon first, until he learned that it had already been invented four years earlier by Paul Baran at the RAND Corporation in the United States. RAND had been tasked by the U.S. Air Force with designing a digital communication network for voice that would still be functional during a nuclear attack. In a 1961 report, Baran suggested digitizing voice calls and using a distributed network of computers to facilitate this. The Air Force shelved the network plans, but Baran's packet switching principle (which he called *Hot Potato Routing* at the time) lived on and by way of Donald Davies, it made its way to Roberts. When Roberts heard about packet switching at the conference, he saw it as a possible routing option for the ARPA network. Upon returning to

the Pentagon, he introduced his group of experts to Baran's publications.

The dominant data and signal routing principles of the time involved a central unit that controlled how data flowed through the network, which was part of the speed and congestion challenge. With packet switching, data messages are divided up into smaller "packets" with to- and from-addresses attached that essentially find their own way through the network, utilizing all the available space. Once all the packets arrive at their destination, they are reassembled into a coherent message.

Kleinrock's prior mathematical work served as proof for Roberts that packet switching could work for the coming network, and the decision was made to base the ARPANET on this technology. Paul Baran himself joined the design group for meetings in 1967 and 1968, consulting on the ARPANET implementation of packet switching. Given that the packet switching principle today underpins not just the Internet, but a majority of all networked data communication, this decision to make the ARPANET the first packet-switched computer network is seen as highly significant. It was a decision that led to the construction of the infrastructure now used by most journalists to conduct research, to search databases for information, and to communicate with sources. Because both the ARPANET and Baran's original packet-switching research was funded by the U.S. government, those technologies could not be made proprietary, patented, or commercialized. This absence of license fees and excludability, along with the proof-of-concept provided by the ARPANET, facilitated networked exchanges of data with a speed and consistency that later would enable mass media to digitize by lowering the cost of mass distribution of content. As the technologies introduced with the ARPANET evolved over the following decades, news organizations previously confined to publishing print media could widely proliferate news stories as video and audio in competition with television and radio.

Building the Network

With packet switching added as the last piece of the puzzle, the overall ARPANET design was now

complete, and ARPA sent out a Request for Proposals to contract vendors who might be able to build the IMP as well as lease and maintain the telephone lines needed to make the connections. The chosen vendor would also be responsible for the daily maintenance of the network in collaboration with Stanford Research Institute (SRI) and UCLA.

The contract eventually went to Bolt, Beranek and Newman (BBN), where Licklider worked previously. The work on BBN's proposal had been led by Frank Heart, with the participation of David Walden, Severo Ornstein, and Robert E. "Bob" Kahn. When BBN won the proposal, Heart led a sizeable team that modified existing computer hardware from Honeywell and coded the software for the first batch of IMP machines.

Four of the institutions represented in the ARPANET design group were chosen as the first four "host" nodes on the ARPA network. The first link was to be established between Kleinrock's laboratory at UCLA and SRI. The first connection between two computers using phone lines, packet switching and IMP "routers," occurred on October 29 at approximately 10:30 p.m., when the Sigma 7 computer in Kleinrock's laboratory at UCLA was connected to an SDS 940 computer at SRI.

The Arrival of Email and Wireless Networking

In the following months, the utility of the ARPANET became evident for most researchers involved with ARPA projects, and in spite of initial reluctance toward sharing computing resources, the number of participating institutions grew. In December 1969, ARPANET consisted of its first four nodes: UCLA, SRI, UCSB, and University of Utah. By August 1972, the ARPANET had expanded to serve 19 more research institutions and hundreds of users.

That year, the ARPANET's first "hit" application emerged: email. Electronic mail had been passed between users sharing a single computer since the early 1960s through programs such as READMAIL and SNDMSG. In late 1971, BBN programmer Ray Tomlinson modified the latter to exchange messages between different computers on the ARPANET. To distinguish users at

different computers, Tomlinson repurposed the “at sign” (@), which originally had designated, for example, a certain amount of products sold “at” a certain price. Tomlinson instead used it to indicate a user “at” a research institution, thereby creating the popular format of name@place that later became standard for email addresses. When the ability to send email over the network launched in early 1972, it quickly became popular among ARPANET researchers, which prompted Roberts to write the first email client that could organize a user’s messages in folders and show messages by subject line.

The Emergence of the Internet

It was also in 1972 that the ARPANET was shown to the public for the first time. Roberts, having taken over from Robert Taylor as director of IPTO, hired Bob Kahn from the IMP team at BBN as his chief scientist in early 1972. Kahn then took the lead on arranging a large demonstration of the ARPANET in the basement of the Hilton hotel in Washington, DC, during the International Conference of Computer Communications in October of that year. In both his roles at BBN and ARPA, Kahn made several visits to Kleinrock’s laboratory at UCLA and met with graduate students working on the ARPANET, including Vinton G. “Vint” Cerf.

In 1973, after Cerf had graduated with a PhD and joined the faculty at Stanford University, he and Kahn discussed IPTO’s plans for expanding the ARPANET into wireless territory by connecting it to planned satellite- and radio-based networks, known as *SATNET* and the *Packet Radio Network*. Under Roberts’s supervision, ARPA had already funded the development of a wireless data network, ALOHANET, at the University of Hawai’i. ALOHANET was an example of several packet-switched networks inspired by the ARPANET that began emerging independently at the time. These newly formed networks, along with ARPA’s own SATNET and Packet Radio Network, convinced Cerf and Kahn that the next challenge after connecting heterogeneous computers in networks, was to ensure that those networks were also interconnected. This inspired the two researchers to begin the development of the TCP/IP protocol suites in 1973. These protocols define the

parameters by which different networks can be interlinked, essentially creating the Internet.

During the 1980s, several companies presented proprietary, commercial alternatives to TCP/IP, including Xerox, whose work on inter-network protocols happened under the auspices of former IPTO director Taylor. Eventually, however, TCP/IP won out and was adopted as the main communication protocol of ARPANET on January 1, 1983, enabling it to connect with much bigger and faster packet-switched networks being built, such as the National Science Foundation’s NSFNET. At this point, several thousands of people at more than 200 host institutions in the United States and Europe were using the ARPANET daily. However, as ARPANET became increasingly integrated into the fledgling Internet through TCP/IP, those users began migrating to faster and larger networks with more resources. By 1990, the ARPANET’s equipment and software were severely outdated and its functions, software, and concepts had all been absorbed into the Internet. DARPA (now with an added D for “Defense”) decided to lay it to rest. When the ARPANET was officially decommissioned on February 24, 1990, the technologies it birthed such as email and FTP were already essential to the journalistic practices of many news organizations in the United States and Europe. That same year also marked a decade since U.S. newspapers had begun publishing stories through sites such as the CompuServe Information Service, which relied heavily on packet-switching and other ARPANET-related technologies.

ADVERTISING

Advertising has always had a complicated relationship with journalism. Traditionally, advertising is defined as a paid message that is typically persuasive in nature from an identified sponsor and placed in various media such as newspapers, television, or online. This has also included activities such as product placement where a brand is integrated into broadcast news programming or more recently as advertising designed to match an online publication's editorial content but used to promote a brand. This entry first discusses the move toward relying on advertising to fund news media in the United States and the evolution of covert advertising techniques. It then looks at how audiences receive these techniques and efforts to regulate them, including industry self-regulation.

Advertising Prevalence in Journalism

Although prior to the mid-1800s, American newspapers were financed primarily by political parties, it was advertising that allowed them to break this dependency. The rise of the penny press enabled publishers to charge readers just a few cents for newspapers by subsidizing production

costs with advertising. With the industrialization of the United States, the emergence and growth of national retailers and brands, and the ensuing consumption-driven economy, media outlets provided advertisers a mechanism to reach audiences and pitch their wares. This advertising-supported media model was replicated in most American magazines and later in radio, television, and eventually, on the internet. Advertising provided much-needed revenue to support the production of news, largely freeing publishers from the shackles of the political sponsors of yesteryear.

For newspapers, this model was successful throughout the 20th century with ad revenue reaching its apex around the year 2000. However, with the rise of the internet in the 1990s, audiences began to have significantly more choices of sources from which to obtain news, leading to newspaper circulation declines. Furthermore, as news organizations migrated online, most failed to install paywalls, instead allowing audiences to consume news content for free. This accelerated the cancellation of subscriptions. Smaller audiences no longer commanded the same amount of advertising dollars. Moreover, internet sites such as Craigslist allowed people to place classified ads online for free, decimating the classified-ad revenue that most local newspapers relied upon.

The emergence of Google followed by the social media site Facebook further eroded the advertising revenue of news media, as did the 2008 economic recession. Since the beginning of the COVID-19 pandemic in 2020, many news organizations—particularly alternative weeklies—have been permanently shuttered because of the disappearance of advertising. However, some publishers—especially local news websites—experienced greater traffic than ever and have been able to convert this into increased digital subscriptions. While in late 2020, it was still too early to make broad conclusions about the impact of the pandemic on publishing, the ability to divert revenue dependence away from advertising to a diversity of sources seems to be important for news media survival.

Advertising Influences on Journalism

The *New York Herald* was an early adopter of the advertising-supported business model, agreeing to

an advertising contract in 1835 with a producer of patent medicine (over-the-counter medications that were generally ineffective and sometimes deadly) after a fire led to the paper's near-financial ruin. According to Ben Bagdikian, *Herald* founder James Gordon Bennett proclaimed the advertising contract allowed the paper to be "more independent than ever." That independence, however, was contingent upon the *Herald* publishing not only an abundance of advertisements for the product, but also what appeared to be legitimate news *articles* about Benjamin Brandreth's seemingly magical pills that supposedly cured almost any ailment (although they did not, in reality). While the advertising from Brandreth allowed the *Herald* to continue publishing, this case is also an early exemplar of how advertising can exert control over the content of newspapers and foreshadows the presence of covert—or hidden—advertising. The *articles* were not any more real than the product was effective.

The practice of working advertising into news programming has not been limited to newspapers. In the 1940s and 1950s, the CBS radio and then television variety show, *Talent Scouts*, featured its Lipton Tea sponsor in the show's opening song. Nearly 75 years later, in 2012, the practice continued with NBC's *Today* show prominently integrating Procter & Gamble when discussing the Olympics.

Boundaries and Agendas

The turn away from political to commercial sponsors coincided with the development of journalistic norms and objectivity, or so-called *unbiased reporting*, around the turn of the 20th century. A cornerstone of the professionalization of journalism was its proclaimed independence, first from political and then commercial influences. Journalists often invoked a metaphorical boundary, or firewall, that separated the editorial, or news, side of the newsroom from the business side. In theory, this wall was intended to protect journalists from the financial pressures of the costs of reporting, especially having to do so profitably. Finances were the domain of owners and publishers who were supposed to shield their journalists from the demands of advertisers who had goals that differed from those of journalism. While the

purpose of journalism was to serve the public interest by providing information necessary for a participatory democracy, the goal of advertisers was marketplace driven: Garner the attention of readers so as to sell their product. As decades of scholarship have revealed, however, in practice, the boundary has been elusive, at best.

The potential gatekeeping effects of this boundary (or lack thereof) between the news and business sides of journalism can be understood from the theoretical perspectives of agenda building, framing, and agenda cutting. In the early tradition of media effects research, Maxwell McCombs and Donald Shaw's conceptualization of agenda-setting theory focused on how news content influenced what the *public* thinks about. An important antecedent to agenda setting, however, is understanding what influences the decisions *news organizations* make in choosing whether and how to cover particular topics or issues. There are both internal and external influences on news organizations of which advertisers are among the latter. In theorizing how this process works, Rita Colistra suggested that advertisers are capable of building news agendas and frames by influencing which topics or issues receive coverage and how they are framed, while they may also cut agendas by pressuring newsrooms to minimize or censor particular topics or issues from news coverage.

Historic accounts as well as those spanning into the 21st century offer evidence of the agenda-building and framing effects of advertising. Favorable news stories about advertisers, such as those written in the *Herald* for Brandreth, were called *puff* pieces or reading notices. Often written by the advertisers themselves, they were offered to keep advertisers happy. In the recovery years following the 2008 economic recession, news organizations began partnering with advertisers to create content that they argue might not ordinarily receive coverage due to its expense. For example, in 2017, the *New York Times* partnered with Mondelez International's V&A snacks brand to sponsor a yearlong journalist-in-residence who produced editorial content for its Travel section. Similarly, the BBC Worldwide has accepted funding from Exxon to report on the environment. Whether or not these resulted in puff pieces, they were produced with the support of advertisers and demonstrate how advertisers can build and

frame the news agenda. Moreover, a 2020 *New York Times* exposé indicates that the practice of puff pieces does continue and has come full circle back to political sponsors. A network of over 1,300 news sites in the United States have been posing as local news organizations but obscuring their funding and taking payment to run *articles* that are often written by a sponsor for political purposes.

Scholarship across the decades also reveals a persistent agenda-cutting effect associated with advertising. For instance, when Camel cigarettes sponsored NBC's Camel News Caravan from 1949 to 1956, footage showing *no smoking* signs was prohibited. Similarly, magazines that accepted advertising from cigarette manufacturers were less likely to run stories about the connections between smoking and lung cancer than those that did not. Particularly at the local level, newspapers have recognized the perils of offending local advertisers with hard-hitting stories. Angry auto dealers have pulled advertising because of reporting on dangerous cars and unsatisfied customers. Even local governments can punish critical news reporting as noted in the headline of a 2019 *New York Times* article: "A Community Newspaper Gets Tough on a Village; The Village Pulls Its Ads." Thus, a continuing threat from advertising-funded media is that advertisers will try to suppress news coverage that is unfavorable to their brands.

Covert Advertising 2.0

Ads disguised as news content were part and parcel of the penny press newspapers. Over the years, the nomenclature used to describe such phenomena has included puff stories, reading notices, feature advertising, and advertorials. In broadcast media, infomercials and video news releases are of the same ilk: paid programming disguised as news. Beginning in the mid-2010s, the term *native advertising* came into use for commercial content in online news publications that is camouflaged to look like news.

In the contemporary digital era, online advertising has become increasingly intrusive and subjects audiences to surveillance. To make the user experience more pleasant and minimize consumer attempts to ignore ads or employ ad blockers, advertising has sought to become more integrated

with news content. Supporters of the practice contend that consumers respond positively to native advertisements, remembering the content and preferring it because of its nonintrusiveness and informativeness. Critics, however, argue that these consumer responses are based in deception since studies demonstrate that most people are unable to distinguish native advertising from news content.

Digital technologies also facilitated the ability for online creators to mimic the appearance of entertainment, informational, and news content. The paid content resembles the authentic content to such a degree that it looks *native* to the platform on which it appears. On digital news sites, native advertisements can use the identical typeface and layout as the editorial content that surrounds it, right down to the masthead of the publisher. Often the only distinguishing feature of native advertising is the disclosure label required by the U.S. Federal Trade Commission (FTC).

Audience Reception

In his book, *Confessions of an Advertising Man*, famed advertising executive David Ogilvy wrote that ads which do not look like advertising would attract twice as many readers and that there was no evidence suggesting the public would resent this practice. While the lack of evidence may have been true when he first wrote the 1963 book, the extant academic literature since the emergence of native advertising has repeatedly demonstrated that audiences generally do react negatively to this practice in digital news contexts. When audiences recognize that content they thought was news is instead advertising, their attitudes toward and perceived credibility of the publisher declines. This has been demonstrated for both digital-only news organizations and for legacy publishers. Audience members who are most likely to experience these negative perceptions are those who engage with news for informational rather than entertainment purposes. When asked their thoughts about the practice of native advertising, over half of people familiar with it describe it as underhanded or deceptive.

While native ads typically do not have an overt sales pitch, often never mentioning the sponsoring brand or company, they are,

nonetheless, attempting to create favorable associations in the minds of readers or viewers. Consequently, the context of the seeming news *article* also affects how people respond. When native ads imitate hard news stories, people react more negatively to the content than when they masquerade as soft news. For instance, readers find it relatively less concerning that the fashion brand, Cole Haan, sponsored an article about the dedication and hard work of ballet dancers in comparison to having an energy corporation, such as Chevron, sponsor content about global energy consumption.

Beyond the conditions that affect how news consumers perceive publishers and the native advertising content itself are the downstream effects the practice has on journalism. According to a 2020 study published in *Journalism & Mass Communication Quarterly*, when people saw a publisher engaging in native advertising, they were more likely to find the subsequent news reporting of journalists at the same outlet to be less credible compared to those who didn't see the native advertising. Thus, while offering news organizations much-needed revenue, native advertising tarnishes the perceived credibility of reporting from actual journalists.

Boundaries and Agendas in the Digital Era

While a large quantity of advertising has traditionally been made by independent agencies that specialize in creating ads, there have always been organizations that have created ads in-house. Media outlets, however, were solely in the domain of being a distribution platform for advertising that was created elsewhere. With the emergence of native advertising, however, news organizations are increasingly adopting a variation of the in-house model by establishing their own content studios. For instance, the *New York Times* has its T Brand Studio, the *Wall Street Journal* has WSJ Custom Studios, and *The Guardian* has Guardian Labs. But these content studios are not creating ads to promote their parent news organizations; they are instead creating content for external clients, including brands, corporations, and even political candidates. News organizations are now in the business of not only producing journalism

but also creating branded content for advertisers that looks like news, as well.

If the metaphorical wall separating the newsroom from the business side of journalism was in question previously, the development of content studios has all but eradicated it. As Ava Sirrah showed in a 2019 article for the *Columbia Journalism Review*, content studio marketing teams—often former journalists—tasked with creating advertiser stories work closely with newsrooms to plan special projects. Journalists accompany sales teams on client visits to help close deals. Furthermore, because most native advertisements have no bylines—a commonality with traditional display ads—journalists sometimes do double duty, writing native advertising content when they are not reporting. Moreover, native ads have been created that directly contradict the news reporting of journalists. For example, while the *New York Times* has published articles about the dangers hydraulic fracking poses to the environment, they have also taken money from Chevron to run a native advertising campaign focusing on the benefits of fracking.

Sirrah's article also indicates that the creation of native ads by content studios does not end the obligation of publishers to their advertisers. Most publishers are contractually obligated to promote the native advertising they created via their social media properties in order to meet agreed-upon engagement metrics. Because audiences have only a finite amount of time they can allocate to consuming media content, publishers are, in essence, creating a competition for attention between their own news content and the native advertising content they created on behalf of their advertising clients. In this regard, it may be particularly beneficial for brands or companies that are experiencing negative press coverage to invest in native advertising that offers a competing, more favorable account of the company.

The use of native advertising for whitewashing purposes appears to be a tactic that a growing number of companies are pursuing. For example, while STAT News—a healthcare-focused news site owned by *The Boston Globe*—was running investigative stories in 2018 about Purdue Pharmaceuticals knowingly promoting the use of its opioid medications despite their addictive properties, STAT was also running native advertising content

sponsored by Purdue about the company's efforts to combat the opioid epidemic. Similarly, as *The New York Times* was reporting in early 2019 on concerns that Johnson & Johnson's baby powder was contaminated with asbestos, they were also running native advertising on behalf of that same company debunking myths about ingredients in personal care products.

When considering native advertising from this vantage point, it is plausible to conceive that content studios may create an agenda that competes with the news agendas of the newsroom. That is, news by its very nature has always told us what to think about. Today, as newsrooms increasingly create native advertising content that appears on their websites, in their news apps, and that they promote in their social media feeds, they are competing with content studios to tell us what to think about.

Empirical research demonstrates the plausibility of this notion. An analysis of thousands of native advertising articles that ran between 2014 and 2019 at three elite news organizations in the United States revealed an agenda-cutting effect on the actual news coverage of these same newsrooms. In other words, companies that paid for native advertising were significantly less likely to appear in subsequent actual news coverage after the sponsored content ran. This suggests a troubling effect of native advertising. If a corporation is receiving unfavorable press coverage, paying that news outlet to create and promote a native advertising campaign can reduce the likelihood of future coverage.

Regulatory Efforts

Efforts to control the encroachment of commercialism on journalism have emerged from at least two fronts: governmental regulation and self-regulation. By the turn of the 20th century, puff pieces and reading notices were frequent. While some publishers voluntarily sought to label the notices with a disclosure or used a slightly different typeface, the passage of the Newspaper Publicity Act of 1912 mandated the use of disclosure labels for advertisements that were disguised as newspaper articles. Two years later, the Federal Trade Commission Act established the FTC and tasked it with protecting consumers and

regulating unfair business practices. Section 5 of the law defined deceptive acts or practices as those that mislead reasonably acting consumers in their conduct toward a product or service. One of the first cases brought by the FTC involved a vacuum cleaner company, Muenzen Specialty Co., that created advertisements appearing to be editorials recommending its product. The commission found the ads to be deceptive.

To address the evolving nature of media and technology, the FTC offered new guidance in 2015, specifically in regard to native advertising. Their concern was whether the format of an ad misleads consumers as to the nature or source of a message. Any commercial message that resembles noncommercial content, such as news, must contain a clear and conspicuous disclosure that alerts consumers to its commercial nature. The guidance, however, is not prescriptive. While the FTC advises that disclosure language such as *advertisement* may be most recognizable to consumers, they do not mandate disclosure language or appearance.

As a result of this lack of standardization from the FTC on disclosures, in practice, publishers use a broad variety of words to identify native advertising including "paid post," "brought to you by," and "partner content." Research on people's ability to recognize native advertising clearly demonstrates that most news consumers cannot distinguish native advertising from actual news articles, even with disclosures. Across many studies, including those nationally representative of the United States, typically fewer than one in four people are able to recognize native advertising. Many people don't understand what the disclosure language means; others don't notice the disclosures because they are not visually prominent. In an effort to appease the demands of advertisers, some publishers even reduce the prominence of disclosures or omit them altogether making it all but impossible for consumers to understand what they are looking at. However, when publishers employ disclosures that audiences perceive as transparent (easier to understand and/or to notice), people respond less negatively to native advertising.

Besides government regulation, industry groups have also offered self-regulatory guidelines. The Institute for Advertising Ethics (IAE) was

developed as a collaboration between the American Advertising Federation and the Reynolds Journalism Institute at the Missouri School of Journalism. In 2011, the IAE released its Principles and Practices for Advertising Ethics. Among the original eight principles, Principle 3 specifies that advertising should be clearly distinguished from news and entertainment content regardless of whether it is online or offline. Similarly, the Code of Ethics for the Society for Professional Journalists indicates that news should be distinguished from advertising and that hybrids that blur the lines between the two should be shunned. Furthermore, it states that sponsored content should be prominently labeled. Without doing such, media critics argue that journalists' ability to act independently in serving the public is compromised. Moreover, given the growing number of academic studies demonstrating that news consumers are deceived by native advertising, it appears that the practice of it by publishers—particularly when not clearly and conspicuously disclosed—violates codes of ethics established by leading industry groups.

Future Directions

With the disappearance of newsrooms around the United States in 2020 from the substantial loss of advertising revenue that was accelerated by the Coronavirus pandemic, it is clear that dependence upon advertising by journalism is an unsustainable model. Finding alternate sources of revenue is imperative. While some critics argue that market-driven journalism should be done away with altogether in favor of nonprofit or publicly funded models, others believe newsrooms need to diversify their revenue sources and minimize their involvement with advertising. In an ideal world, journalists would rededicate themselves to the mission of journalism by adhering to long-standing journalistic codes of ethics. Realistically, however, with newsrooms facing dire financial circumstances, many practitioners consider the old standards of practice aspirational at best.

For the many reasons detailed here, journalism and advertising have always had a complicated relationship. However, advertising is a tool that can be leveraged as more than just an income

source. As journalistic outlets have become brands unto themselves, there is the opportunity for them to remind the public that independent-minded newsgathering is vital to democratic life. Prior to 2016, newsrooms typically spent little in advertising their brands to the general public. Since 2016, however, the work of journalists has become increasingly devalued and hazardous to pursue—both at home and abroad—with attacks on the press as *fake news* and *the enemy of the people*. As a result, news organizations have begun to vie for audiences' attention and respect. A nascent genre of journalistic self-defense advertising has emerged with, for example, the *New York Times*' "Truth" campaign, as well as CNN's "Facts First" promo, and ABC News' "Straightforward" ad. Moreover, during Super Bowl LIII in 2019, for the first time ever, a news organization was among the advertisers when *The Washington Post* aired its "Democracy Dies in Darkness" ad, narrated by all-American actor Tom Hanks. As local newsrooms look to promote themselves, collaborations with local college and university advertising and communication programs may prove fruitful.

ADVERTISING, ETHICS IN

Advertising ethics is a normative process that begins with moral awareness and ends with an ethical decision. While the process involves many different stakeholders, the practitioners involved in planning, designing, and placing advertisements on behalf of their clients are the people primarily responsible for perceiving and responding to the ethical nature of challenges. Other stakeholders include marketers of products and services, vendors and suppliers, and media organizations. Consumers are also important stakeholders in determining the extent to which advertisements and processes are right and good, since a marketer's success is dependent on consumers' trust. This entry provides an overview of the context in which ethical challenges in advertising arise, explores the nature of those challenges, and offers guidance for decision-making.

The demands of honesty and transparency present ethical challenges in advertising practices such as greenwashing (claiming, overtly or tacitly, that a company's products are more environmentally friendly than they actually are), image retouching, fear appeals, online sponsorships and disclosures, online behavioral targeting, digital

advertising fraud, and native advertising (paid ads that match the look, feel, and function of the media format where they appear). Organizational challenges include embracing social diversity, fair treatment of others, and the offering of incentives by marketers. Products such as tobacco and alcohol also constitute ethical challenges in advertising because they are deemed harmful to one's health. And anticipating the consequences of advertising requires moral deliberation, because its effects, although they may not be intentional, might result in harmful behavior, especially when vulnerable individuals are reached. In response to such ethical challenges, practitioners rely on various resources such as codes of ethics and engage in decision-making that entails one's sense of duty, social responsibility, and accountability.

The context in which ethical challenges arise is constantly evolving and is influenced by new technology and communication platforms, as well as by the changing relationship between advertising and journalism. According to the social responsibility theory of the press, democracy is served by truthful information for debate and discussion. When ethical breaches occur, trust in this information falters. Historically, the press has been financially supported, in part, by advertising revenue. This relationship is considered ethical when adequate separation exists, and journalism remains free from financial pressure and the special interests of advertisers. Practices once clearly delineated as journalism versus advertising, however, are blurring (e.g., native advertising; bloggers endorsing products), and funding models are changing, thereby putting more pressure on publishers to accept new forms of advertising revenue. Because of this evolving and codependent relationship, understanding its ethical implications is important. An advertisement is of value only to the extent to which it is perceived as truthful, which influences and is influenced by journalism's credibility.

Advertising Ethics in Context

Ethical practice in advertising requires an awareness of the ethical nature of challenges in order to determine what is right and ought to be done. Considering the vast array of services offered, the multiple stakeholders involved, and the range of

goods and services promoted, all in the context of an evolving marketplace with blurred boundaries, it's not surprising that ethical challenges in advertising arise.

Collectively, the businesses and individuals impacted by and involved in advertising practices are referred to as *stakeholders*. The advertising industry is composed of several interdependent businesses. Advertising agencies offer services of account management, research, strategy, media planning, and creation, among other more specialized services such as branding, digital advertising, and experiential marketing, to name a few. These services are offered to clients, the marketers that research, develop, distribute, and advertise products and services. Advertising agencies are hired to assist marketers in promoting goods and services by providing the aforementioned services with the assistance of vendors and suppliers such as directors, photographers, and printers. Advertising agencies might also hire collaborators such as actors and social media influencers. Media companies are also involved in the advertising process and include news organizations, publishers, and communication platforms from which advertisers purchase time and space to place advertisements.

A key stakeholder is the audience, who are arguably the most affected by ethical problems in advertising. An audience (i.e., viewers, readers, and listeners of advertisements) is comprised of (a) current consumers characterized as buyers, users, or those that influence another person to buy or use the product or service; (b) prospective consumers, those who are likely to buy the product or service in the future; and/or (c) those unintentionally reached, who are neither current nor prospective consumers.

As media and technology evolve, advertising services cross, or blur, boundaries with other related professions such as journalism and public relations. An advertisement has traditionally been characterized as paid (e.g., cost for space, time, impressions on consumers), mediated (e.g., via online, television), strategic and promotional content (i.e., content intended to persuade a targeted audience to purchase or use a good or service), by an identified sponsor (e.g., brand, marketer). By comparison, public relations have traditionally been characterized as earned content such as news coverage of an event in response to a press

release. However, contracting social media influencers, who are paid to sponsor content on social media platforms such as Instagram, also falls under the purview of public relations. As another example, native advertising appearing on news sites as paid, strategic content (i.e., intended to convey a specific message) is, at times, content written by employees of the news organization whose identified sponsor is indistinguishable by the reader. These shifts in services offered and by whom, at times unbeknownst to the audience, have implications for accountability and credibility. As boundaries blur and responsibilities shift, audiences and consumers aren't always aware of the sponsor, such as in the case of native advertising, resulting in diminishing trust toward the sponsor, content producer, and content platform.

Those responsible for determining what is right and good in advertising are the practitioners confronted with making a decision in response to an ethical challenge. Advertising practitioners' perceptions are often understood through a variety of methods including interviews and surveys. There is also concern for the extent to which their environment and organizational culture impacts ethical awareness and ethical decision-making. In the new millennium, scholars have begun to conduct studies of moral psychology concerned with practitioners' moral deliberations, which are impacted by their personality traits and by their moral development, which starts in childhood and is influenced by socialization, education, and age.

This normative process is also influenced by and understood from other perspectives, including consumers' perceptions of advertisements and related practices. Research on consumers' perceptions involves the examination of consumers' experiences with advertisements; that is, how they react to, or are affected by, advertisements (e.g., Pepsi's "Live for Now" video featuring Kendall Jenner), strategies therein (e.g., fear appeal such as in anti-tobacco advertisements), or types of advertisements (e.g., native advertising). Consumers' perceptions are important to consider, because, as previously stated, advertising is only as successful as it is deemed credible. When polled, however, consumers have consistently suggested that they have low levels of trust in advertisers, a finding that has significance for the ethical challenges that arise in advertising.

Ethical Challenges in Advertising

Ethical challenges in advertising may be categorized according to business ethics (e.g., the practice of accepting incentives from clients); message ethics (as, for example, in native advertising); the practices and processes involved, including what types of advertisements are produced; the products and services advertised; and the consequences of a process or advertisement regardless of whether or not the effects are intentional.

Practices and Processes

Most ethical challenges in advertising fall within the category of practices. The challenges might be in response to new technology or communication platforms, for example. Regardless of emerging practices, honesty has consistently been a practical challenge, given the nature of planning and creating an advertisement intended to fit within a designated and purchased time slot (e.g., a 30-second video) or space (e.g., an outdoor billboard). As a result of these limitations, the omission of certain information occurs. However, omission by default is not necessarily unethical, just as persuasion is not unethical. However, omission with the intention to deceive is ethically problematic. For example, intentional deception occurs in the practice of greenwashing. Greenwashing occurs when a business promotes the perception that its products, services, or policies are environmentally friendly by providing a claim with no proof, or a factual claim that serves as a diversionary tactic to mask another, often more impactful, environmental issue.

Closely related to the challenge of honesty and truthfulness is transparency. Questions of transparency may arise when working with and touching up images and video (e.g., altering images with programs such as Photoshop) and when disclosing online sponsorships. For example, advertising agencies might compensate bloggers and social media influencers for endorsing a client's product by covering travel expenses, providing product samples, or with a flat rate. In an effort to be transparent about this financial partnership, an agency or client will ask the sponsor to sign a contract that provides specific language regarding how to post a clear and prominent

disclosure. Disclosures such as hashtags (e.g., #sponsored) inform viewers that the product is being endorsed in exchange for some form of compensation and is therefore an opinion influenced by a marketer's interests.

Other ethical challenges include the use of stereotypes or appeals that might objectify individuals or coerce an audience, such as emphasis on sexuality or fear appeals (e.g., disgusting or frightening images in anti-tobacco advertising). Online behavioral targeting and online behavioral advertising present another challenge regarding the use of private information. Mobile users don't necessarily understand how companies use their data, yet they accept certain risks for the convenience of receiving information and incentives such as free access to content or notifications of sales promotions. Digital advertising fraud is another ethical challenge concerning the programmatic buying, placement, optimization, and billing of online ads. For example, a client might not receive fair pricing for online ad placement, based on clicks and views, when it is not known what share of advertisements are being viewed by bots rather than by humans. Furthermore, specific types of advertisements present ethical challenges. As noted earlier, native advertisements are designed to simulate and blend in with editorial content and are therefore misleading, especially when audiences are unaware of their paid and promotional nature. Additional challenges include the fair treatment of clients (e.g., representing two or more clients competing in the same product category) and the fair treatment of other agencies (e.g., poaching another agency's current clients).

Products and Services

Another category of ethical challenges in advertising involves the promotion of certain products and services, such as those deemed harmful including alcohol and tobacco, or others considered controversial, such as marijuana. Ethical challenges might also relate to the practices of a specific industry. For example, in fashion and apparel, these practices might include the use of animal by-products, which are widely considered inhumane and harmful to the environment; or unfair wages for employees working for third-party manufacturers.

Consequences

The consequences of planning, creating, and placing advertisements often have ethical implications, whether or not they are intentional. Consequences might include misleading and deceiving an audience, as when copywriting omits relevant information or includes inaccuracies, or when the layout and design of an advertisement obscure sponsorship disclosure. As noted earlier, advertisements that encourage the use of certain products such as alcohol might result in harmful behaviors or outcomes, such as driving under the influence. When targeting certain audiences, others are often unintentionally reached including those considered vulnerable (e.g., too young to understand the persuasive nature of the content). Lastly, advertising has been criticized for perpetuating materialism and exacerbating racism and sexism often through the practice of stereotyping.

Ethical Decision-Making in Advertising

The normative process of ethical decision-making in advertising suggests that the individual tasked with making the decision is able to identify a challenge's moral and ethical qualities, evaluate those qualities, and act accordingly; that is, in the right way. An advertising practitioner with ethical awareness might ask, "What is the right thing to do in this situation?" "How should I act because it is my duty?" "To whom am I responsible?" and "What are the consequences of my actions?" When an advertising practitioner is unable to ascertain the moral qualities of a challenge, they are said to have moral myopia versus moral awareness. Moral myopia can exist in various degrees from being unable to recognize the ethical nature of a challenge to being unable to express a problem in terms of morality. For example, if a practitioner were to suggest that honest advertising is simply an issue of legality, and one for the Federal Trade Commission (FTC) to regulate, they would be exhibiting moral myopia.

Although ethics should not simply be equated with or reduced to the law, the law must of course be followed and provide guidance for doing what is right in advertising. The FTC helps to regulate truthfulness in advertising by setting guidelines

and responding to complaints; in addition, self-regulatory organizations provide standards of practice to hold the industry and its many stakeholders accountable. When a practitioner deliberates what is right and good, they are applying theories of moral philosophy. And the extent to which they are able to assess the moral dimensions of a situation is impacted by their moral development.

Governmental Regulations

Although, as noted in the preceding section, doing what is ethical is not simply a matter of doing what is legal, the First Amendment to the U.S. Constitution is a foundational starting point for understanding the ethical nature of challenges in advertising. Advertising is commercial speech, one of the least protected forms of speech, and therefore subject to governmental regulations. Simply put, to be legitimate, advertising must be for a legal product and must be truthful. Certain industries are more strictly regulated than others because their products are deemed harmful, such as tobacco products, or harmful if misused, such as pharmaceuticals. While some regulations are proactive, many are reactionary and are established in response to complaints and legal settlements. Overall, the FTC operates through a reactionary process by first responding to complaints against misleading, deceptive, or harmful advertising and then making a recommendation to the courts. When evaluating truthful advertising, it is important to note that puffery is permissible, which is a subjective exaggeration that no reasonable person would take literally (e.g., “world’s best coffee”).

Self-Regulation

Self-regulation is a cost-effective industry practice to help businesses take responsibility for their actions and hold one another accountable. Advertising businesses adhere to self-regulatory guidelines to do what is right as well as what is best for clients; to maintain efficient and positive relationships with suppliers and vendors; and to maintain a favorable reputation as an industry. Accountability is a key factor in ethical problem-solving since various stakeholders are involved and,

therefore, there are many opportunities to pass responsibility onto another stakeholder, which is colloquially referred to as *passing the buck*.

Self-regulation in advertising began in the 1970s and is credited to the work of Howard Bell, former president of the American Advertising Federation (AAF). In addition to the AAF, some other prominent trade organizations that set ethical standards for the advertising industry include the American Association of Advertising Agencies (4As), the Association of National Advertising (ANA), and the Interactive Advertising Bureau (IAB). In addition, the National Advertising Division (NAD) and Children’s Advertising Review Unit (CARU) are responsible for independently monitoring and reviewing national advertising for truthfulness and accuracy, and CARU sets guidelines for advertising to children under 12 because they are considered a vulnerable audience.

Moral Theory and Moral Development

There are several moral theories that explain the ethical nature of challenges and ethical decision-making in advertising. Teleological theories such as consequentialism are concerned with the outcome of one’s actions. For example, the theory of utilitarianism maintains that, ideally, a person’s actions should do the greatest good for the greatest number of people. Utilitarianism is therefore appropriate to apply to the practices of advertising that involve and affect various stakeholders, from clients and vendors to publishers and their audiences.

By comparison, the philosopher Immanuel Kant’s deontological theory and categorical imperative of honesty suggests that all persons unconditionally have a duty to tell the truth regardless of the circumstances or consequences. The ubiquitous challenge of honesty shows up in several ethical models for problem-solving, including the TARES test developed by scholars Sherry Baker and David Martinson. The TARES test asks practitioners to consider five principles when evaluating persuasive practices and messages: *truthfulness* of the message, *authenticity* of the persuader, *respect* for the audience, *equity* of the persuasive appeal, and *social responsibility* for the overall good.

When evaluating the ethical nature of advertising practices and messages, it is important to consider the moral principles of autonomy, justice, and respect, which are relevant to several challenges, including that of transparency. Advertisers can respect their audience by treating them as autonomous agents, free and capable of making rational choices, by providing truthful information upon which they can base decisions. For example, sponsored content must be identified (i.e., as paid and by whom) so that a reader can evaluate the content relative to its source and persuasive nature. A story written about cruises by a journalist versus one sponsored by a company that owns a fleet of cruise ships have two very different intentions. By disclosing the sponsorship, advertisers are acknowledging the importance of autonomy and justice by ensuring everyone has the same information.

A person's ability to apply moral reasoning to a challenge in advertising is based, in part, on that person's moral development. Moral psychologist Lawrence Kohlberg suggested that "the first virtue of a person, school, or society is justice," defined as "equity or equal respect for all people" (1981, p. xiii). According to moral development theory, justice is learned during childhood, and moral reasoning skills continue to advance into adulthood and throughout formal education. Therefore, moral deliberation occurs at the individual level but is influenced by several social factors including organizational culture. Moral awareness can be influenced by the shared and espoused values of an organization (e.g., if honesty is a prioritized and often-discussed value) as well as by the characteristics and virtues of its employees, especially leaders. Leaders are especially influential when they are communicative and highly visible throughout the organization.

Ethics in Advertising Practice

Codes of ethics allow an advertising agency to formalize their position on ethics and share with employees and external stakeholders the value that the agency's leadership places on doing what is right and good. Codes of ethics are usually structured, elaborated upon shared and prioritized values; they represent what an organization stands

for and hopes to achieve, and provide guidelines for practitioners to follow.

Such codes of ethics, however, have been criticized as vapid and nothing more than a public relations tactic. Accordingly, some advertisers and the agencies that represent them also engage in and publicly promote socially responsible practices such as brand activism and corporate social responsibility (CSR). Brand activism signifies a business using its resources (e.g., profits and clout) for good in a committed and authentic way, which is reflected in its business model and organizational mission. Good acts can be political, social, and/or environmental in nature, such as Patagonia's mission to protect national parks and national monuments, which included a lawsuit against the 45th U.S. president, Donald Trump. Similarly, CSR denotes a business's commitment to improving societal well-being through voluntary business practices and with in-kind and monetary contributions. A business might engage in environmental, philanthropic, volunteer, and ethical labor practices. The Walt Disney Company engages in water conservation practices and uses renewable electricity to reduce its carbon footprint. Warby Parker, an online retailer of prescription glasses and sunglasses, originated with a business model that included the "Buy-A-Pair, Give-A-Pair" program by partnering with nonprofits to bring prescription eyewear to people in developing countries. These examples illustrate that advertising ethics involves not only the evaluation of ethical challenges but also the intentional and proactive process of performing socially beneficial acts.

ADVERTORIALS

An advertorial is a special advertising section designed to appear similar to editorial content, often approximating the editorial style as well as the typographical look and feel of the journalism or editorial content in the print or online

publication where it appears. The text copy and visual images within an advertorial may be created by the advertisers themselves, by an advertising agency, or by the editorial staff of the print publication. However, the space in the publication is sold as an advertisement; and the advertiser, not the editor, has editorial content control over the text and images of the advertorial.

In the United States, in compliance with Federal Trade Commission (FTC) regulations, most advertorials are marked as advertising. Disclaimers may be as simple as the word *advertisement* printed near the advertorial or as ambiguous as legal text implying the content as advertising. However, some advertorials have no disclaimer at all. Most print and online publications allow advertorials with restrictions, and most allow them to have a similar typography and style as their editorial content. This entry discusses the history of advertorials, the reasons advertisers use them, and concerns that have been raised about their use.

Advertorials are as old as mass-circulation publications. In earlier times, wealthy patrons would pay printers for access to space in or near editorial content, usually for letters to the public. The practice of advertising firms creating and placing advertorial content developed during the early 20th century. The term *advertorial* may have been coined by advertising agencies themselves to avoid a negative reaction to a covert practice of influencing magazine editors. The word first appeared in dictionaries in 1961. The term *matte release* has also been used to describe public relations materials that are written in the format of entertainment, lifestyles, or “soft news” formats and sent to local outlets of newspaper chains in the mid-20th century. This name is still used occasionally by integrated marketing communications professionals. The term *native advertisement* is also equivalent but is used almost exclusively in describing online and social media platform advertorial content. This may include payment to celebrities and other social media influencers.

Magazines have been more associated with advertorials than other print publications because of their national reach, slower production schedule, and special demographic relationship with their readers. The advertiser's product brand can be enhanced by the magazine's brand, and vice versa. Brand magazines, created and published by

companies as a customer engagement strategy, are not technically advertorials but may require a disclaimer. Similarly, full sponsorship of radio and television programs (e.g. *Texaco Star Theater* and *Philco Television Playhouse*), product placement in films and television, infomercials, branded publications (e.g. *Guinness World Records*), and paid search engine results fall outside the strict definition of advertorial but share many components.

Advertorials allow advertisers to tailor a creative message to very specific audiences which can be both diverse and targeted. An example of such an audience would be women 25–35 across different ethnic and class demographics. An advertorial can be changed to match the readership of a specific magazine, while still retaining the marketing content of the overall advertising campaign. Utilizing social media data analytics, advertorial content can be targeted at Black professional women aged 25–35 in one periodical, and Latina women aged 25–35 in a different periodical with fine-tuned demographic design and content.

According to audience research, most readers can easily differentiate between regular editorial content and advertorials and are less likely to read advertorials than a periodical's regular editorial content. However, the readers who do read advertorials are far more likely to remember the product or take an action. Because of this unique factor, advertisers use advertorials as keystones in marketing campaigns because advertorials allow longer portions of text to be published than standard advertisements, particularly for well-known brands.

On magazines' websites, an advertorial may have hyperlinks leading to the website of the advertiser. This makes advertorials in online magazines similar in function to online banner ads. The effectiveness of online magazine advertorials is disputed. Many advertisers believe readers can too easily bypass online advertorials, and instead favor robust independent advertising websites, similar to brand magazines.

Critics of advertorials argue that the practice is coercive because the placement in a print publication in or near regular editorial content implies endorsement or editorial oversight. Another criticism is that advertorials are an example of the creeping commercialism within journalism and within media culture overall. But as noted earlier,

advertisers have been placing advertorials or similar paid content in journalistic publications for many years.

In the January 1915 issue of *The Saturday Evening Post*, the Cadillac Motor Company inserted a full-page advertisement that carried only text, and was formatted to appear similar to the style of other content in the magazine. The text did not mention any products but did include the Cadillac name and logo at the top and bottom of the page. The essay was written by Theodore MacManus, a former reporter working for advertising firms. The style of the piece was designed to mimic or complement the style popular in *The Saturday Evening Post* at that time.

From 1972 to 1985, the Mobil Oil Company published a regular 1,000- to 1,300-word advertorial in *The New York Times* editorial section. The advertorial typically was published on Thursdays and was frequently targeted to policymakers and other social influencers that Mobil had discerned from their larger public affairs campaigns. Under the direction of Herbert Schmertz, these advertorials were written in the style and format of the invited op-ed pieces they were positioned with. The advertorials were run in compliance with the FTC regulations and were listed as paid advertisements. Although *The New York Times* had published advertorials before, the Mobil advertorials were the first of a multiyear duration with a consistent tone and corporate message.

While the Mobil advertorials were occasionally controversial, much of the sponsored content was broadly accepted and the advertorials became an expected outlet for corporate announcements and support for energy policy initiatives. Critics of the advertorials pointed to the self-serving nature of the content and expressed concerns over corporate influence of journalism based on the financial arrangement with the newspaper. Mobil Oil was considered a pioneer in using advertorials to explain their policies during the oil crises of the 1970s.

More recently, an advertorial in *The Atlantic* prompted debate over the role of native advertising. For approximately 12 hours on January 14, 2013, *The Atlantic* magazine ran a "sponsored content" story on the leader of the Church of Scientology and the church's recent real estate acquisitions, titled "David Miscavige Leads Scientology

to Milestone Year.” During the time the advertorial was on *The Atlantic* website, the user comment area was monitored by the marketing team and not the editorial staff, and negative user-generated comments about the story and Scientology were deleted.

ADVOCACY JOURNALISM

Often passionate and fiercely opinionated, advocacy journalism rejects the separation of news and opinion that characterizes contemporary journalistic norms. While still rooted in gathering, organizing, and presenting reliable information, the advocacy journalist is openly trying to make a case, rather than attempting objectivity.

Advocacy journalism was the norm in American newspapers before the 20th century, though its recent revival—particularly on cable news networks—has been controversial. Often linked to political parties or social movements, it served as part of broader mobilization efforts intended to bring about social change (or sometimes to hold it at bay). However, advocacy journalists would insist that they are as committed to accuracy as anyone—perhaps more so, given the need to build credibility with readers accustomed to a different style of reporting. This entry discusses the origins of advocacy journalism in the United States, the move away from advocacy journalism in mainstream news media beginning in the early 20th century, and new forms of advocacy journalism in the mainstream and alternative news media.

A Journalism of Ideas

Advocacy journalism is one of the two founding strains in modern journalism (the other being the provision of the commercial and political news essential to societal elites). Most early newspapers

were closely tied to political and religious factions; although some were explicitly campaign organs, more typically newspapers adopted a stance of impersonal journalism in which the editor advocated his cause not in a strident tone, but rather through the mix of essays, letters, minutes of board meetings, poetry, and other items selected for publication. Advocacy journalism served its cause by presenting information and ideas that supported a point of view, and by serving as a forum in which political and social currents could develop and articulate a common program.

From the earliest colonial newspapers in North America to the partisan press of the early 1800s, editors were actively engaged in the political struggles of their day—and indeed formed the backbone of the emerging two-party system. The partisan press is perhaps the best-known expression of advocacy journalism, and the mythology of a party press run amok is often cited as the backdrop against which more commercially oriented popular newspapers emerged in the 1830s. Partisan newspapers such as Boston's *Daily Advertiser*, the New York *Courier and Enquirer*, or Cincinnati's *Gazette* published detailed reports of the workings of government, helped mobilize voters and organize disparate interest groups into viable national political groupings, and crusaded on behalf of their party's pet nostrums—exposing the perfidy of Freemasonry, denouncing the first Bank of the United States, and singing the praises of their particular candidates. But penny papers such as the *New York Tribune* were every bit as politically engaged as the traditional partisan organs that served elite audiences. *Tribune* editor Horace Greeley rejected both “servile partisanship” and “mincing neutrality,” opening his paper's columns to a wide variety of reform schemes from the establishment of utopian communities to temperance and universal public education. While there was a steady trend toward avowed political independence during the 19th century, as newspaper revenues shifted from subscription-based to advertising-based, advocacy retained a prominent role in many newspapers.

The New Journalism that began in the late 1870s and was the dominant newspaper form by the turn of the century, boasted of its independence from party spirit, but nonetheless pulled no punches in its relentless pursuit of what it saw to

be in the public interest. In the early 20th century, muckrakers, similarly, were unabashed in their advocacy of greater regulation, civil service reforms, and other measures to safeguard the public from special interests and emerging corporate power.

As advocacy journalism continued to play an important role in the mainstream press, advocacy was central to the emerging foreign language press and to the legions of periodicals issued by African Americans, labor unions, socialists, women's rights activists, and a host of other movement organizations. So central was journalism to these movements in the late 19th and early 20th centuries that when Chicago authorities set out to suppress the radical labor movement in the aftermath of the 1886 eight-hour working day protests, police raided the offices of the German-language daily *Chicagoer Arbeiter-Zeitung*, arresting and ultimately hanging August Spies, who served as its editor and business manager, as well as Albert Parsons, the editor of the English-language labor weekly *The Alarm*. Chicago supported several radical labor dailies published in the various languages spoken by its immigrant workers for decades to come, as did other cities. These newspapers published agitational and theoretical articles on a wide range of subjects, as well as cultural material and local advertising. But the heart of the newspapers was articles on local events and workers' struggles, often written by participants in the movements they served.

By the end of World War I, this foreign language press was in decline, and newspaper consolidation encouraged daily newspapers to embrace the language of objectivity, though a great deal of overt advocacy could still be found in the columns of William Randolph Hearst's newspapers, and sometimes more discreetly elsewhere. Advocacy journalism and interpretation was gradually displaced in mainstream U.S. newspapers by more event-centered reports, and a journalistic ideology that sought to present an objective, even scientific, account of the day's events to a readership that crossed class, ethnic, and political boundaries. Newspapers seen to embrace a partisan tilt were reviled by journalism critics, and generations of reporters were trained to produce journalistic accounts free of the taint of political bias or personal judgment.

It is far from clear that this just-the-facts style connected with readers at its inception in the early 20th century or in the years that followed; even as newspapers were banishing opinion and personal expression from their news reports, they were institutionalizing the columnist and entire sections devoted to features. The broadcast networks hired “commentators” to host their news programs, and listeners were rarely forced to guess where they stood on the major issues. As broadcast news divisions became institutionalized and moved from single-sponsor programs to spot sales, however, they too increasingly sought objectivity in their reports.

New Forms of Advocacy

Because of their close connection to the grassroots, alternative journalists have often been able to break news stories or offer perspectives unavailable to established media, a phenomenon documented in the United States each year by Project Censored. Just as alternative journalists during the 19th century, writing for such publications as the *National Anti-Slavery Standard*, Frederick Douglass’ *North Star*, or the *Arena*, once forced the horrors of slavery and child labor onto the national agenda, those writing in the late 20th and early 21st centuries for *Ramparts*, *The Nation*, and a host of other alternative publications exposed war crimes in the Russian Republic of Chechnya and in Vietnam, published the first accounts of the AIDS epidemic, and gave voice to victims of police brutality and political repression around the world. The mainstream press, too, publishes much advocacy, even if it is often confined to editorial pages and op-ed page columns, or to magazine sections. *The New York Times*’s Nicholas Kristof, for example, played a central role in pushing human rights abuses in the Darfur region of Sudan onto the world stage in 2005, while media outlets of all stripes frequently advocate for civic improvement or other nonpartisan causes even on their front pages.

Faced with continued erosion of public participation in the public sphere that has been the focus of journalism since its origins—reflected in the post-World War II era by declines in voting rates, newspaper readership, associational life, and even participation in amateur bowling and

softball leagues—many U.S. media organizations turned to initiatives such as civic journalism in the 1990s in an effort to simultaneously revive the public sphere and the practice of journalism. The *San Francisco Chronicle*, now the only surviving metropolitan daily in its market, announced its commitment to a “Journalism of Action” in 2007, combining traditional reporting with information encouraging readers to become involved in seeking solutions to the city’s and region’s problems.

As many alternative newspapers and magazines struggled in the early 2000s to find distribution and financial support, aggravated by the industry-wide collapse of newsstand sales, much of the advocacy once found in their pages shifted to the Internet. Sites such as The Intercept, HuffPost, and the Marshall Project offer a mix of commentary and reporting, including many carefully researched investigative reports. Conservatives have robust radio and television networks but also Internet sites ranging from commentary to conspiracy-mongering.

News aggregators on the Left (Daily Kos) and Right (Breitbart) have less original reporting and more commentary but offer their substantial audiences an immersive, homogenous news environment. Podcasts offer platforms for both political invective (e.g., Chapo Trap House) and long-form journalism. And as local journalism has been devastated by layoffs and newspaper closings, displaced journalists and community activists have launched local journalism sites to fill the void. In San Diego, California, activists revived the “underground” *OB Rag* as an online journal (and posted scans of several issues of the original paper) in 2007, one of thousands of locally oriented news sites. Hundreds of other sites masquerade as local, but are actually part of centralized networks such as Locality Labs L.L.C. pushing syndicated articles, automated content, sponsored material, and press releases.

By the first decade of the 21st century, advocacy had once again become a popular style of journalism, with Fox News’s overt if undeclared partisanship, the “reported editorials” of *The Wall Street Journal*, an explosion of news and opinion websites, alternative community papers and podcasts that often bring a more personalized approach to their reports, and a resurgent

interpretive journalism that inevitably blurs the lines between straight reportage and advocacy.

Advocacy journalism remains highly controversial within journalistic circles, however, even as evidence mounts that many in the audience are unable to distinguish between unabashed partisanship and journalistic reports that adhere to the norms of objectivity. As journalism outlets experiment with more interpretive and narrative storytelling frameworks, many have accused them of slipping into or even embracing advocacy. The charge is seen as so serious that Fox News long denied that it engaged in advocacy journalism—instead proclaiming it was “Fair and Balanced,” until replacing the motto with “Most Watched, Most Trusted” in 2017. (Arianna Huffington, the founder of the overtly partisan Huffington Post [now HuffPost] website, differentiated her journalists’ unabashed advocacy from Fox News by maintaining that her site was committed to accurate reporting, and providing important information even when it sometimes undercut causes or candidates they otherwise supported.)

Many have turned to civic engagement as a way of addressing the crisis facing journalism and urged more interpretive and citizen action-oriented coverage as one approach that might serve as a means for rebuilding the public sphere. While many journalism scholars argue that media need to promote civic reengagement, some journalists fear that this would challenge the objectivity they see as central to the profession. Interpretive and explanatory articles increasingly press the boundaries of objectivity even as journalists are urged to offer more personal reflections on social media. But while many see advocacy creeping into the mainstream (if often under the guise of explanatory journalism or through special projects), it remains the core editorial mission for many media outlets, including most national cable TV news networks, community radio and cable access public affairs programming, alternative tabloids published in many cities, and a plethora of “movement” and other specialized publications. This advocacy plays an important role in enabling communities to identify and address concerns and in providing millions with a voice in public debate that would otherwise be missing.

AERIAL PHOTOGRAPHY

Aerial photography includes several techniques and has many purposes for journalism. The radio-controlled, airborne drone with photographic capability is one of journalism’s latest newsgathering tools. Aerial photography uses an assortment of aircraft and camera technology to achieve the extreme, top-down perspective seen in dramatic news segments of car chases, natural disasters,

weather forecasts, and events in which large crowds gather. In addition to drones, aerial images from helicopters and satellites are historically significant in the field of photojournalism.

Definition and History of Aerial Photography

The terminology of aerial photography is varied and includes such monikers as aerial perspective, aerovision, aerial shot, bird's-eye-view, god's-eye view, vertical shot, atmospheric shot, Olympian perspective, and panoramic view. Aerial photography includes images that are classified as high-angle camera shots. But the distinguishing aspects that separate most high-angle camera imagery and aerial photography are the aesthetic look of the image, altitude, and a connection to the ground. Aerial photography requires flight of some sort so that a photograph can be taken from an altitude above the Earth that would, in most cases, be impossible from, for example, a long pole, ladder, or high perch.

The vertical dimension of the space above the ground is virtually unlimited and the altitude of operation is dependent on the aircraft used. Flying drones, for example, provide images from several dozen feet high. Satellite photographs are taken from hundreds or thousands of miles above the Earth. Helicopters, blimps, and airplanes also have limitations on how high or low they can fly. In the United States, the specific regulations regarding how high or low a given aircraft can fly are governed by the Federal Aviation Administration (FAA). Other countries have different aircraft regulations. For example, as of 2020, in the United States, drones are legally allowed to fly as high as 400 feet above the ground, while in the European Union, they can fly up to 500 feet high. Helicopters used for newsgathering can operate in the United States at a minimum of 500 feet above the highest nearby structure and, depending on the model and make of the helicopter, can fly many thousands of feet higher, if needed.

The camera technologies creating aerial photographs also vary. There are small, lightweight consumer-quality cameras mounted on crewless drones and controlled via radio frequencies or Bluetooth technology to activate the shutter, high-definition television-quality cameras used for

traffic reports and other news stories onboard helicopters or airplanes, and high-resolution images produced by the sophisticated cameras on today's weather and surveillance satellites. Complicating things is the variety of aerial photographic technologies that are continually evolving to provide sharper images at higher altitudes for less cost.

The high-angle imagery produced by a camera at altitude has been called one of the defining perspectives of the 20th century. Mechanical flight and photography have parallel histories that have intertwined to produce unique forms of visual imagery. Moreover, the aesthetic and psychological features of the high-angle aerial shot are significant. The high-angle aerial shot achieved through flight takes the vertical dimension of visual perception to a different level than that associated with other kinds of camera shots. Besides, the ability to see from a high altitude gives people unprecedented access to the world below, one that changes some of the underlying assumptions of vision itself.

Before any form of human aviation was possible, the visual experience had been based on a horizontal perspective from the viewpoint of a standing human. Sightlines have stability because they correlate, albeit to varying degrees of geometric abstraction and extension, to the physical and mental being of a grounded individual. Even when artists attempt to portray a bird's-eye view, as with the painted cityscapes of the 18th and 19th centuries, they maintain a sense of horizontality.

The detachment and destabilization that came with aviation radically changed the potential for visual perception. Removed from the horizontal vectors of grounded sight, one experiences a new way of seeing as the eye is directed vertically and perpendicular to the ground. The aerial viewpoint creates new possibilities for apprehending the relationships between people and the land. If we look at things historically, even though human flight has been possible for several centuries, the aerial camera viewpoint achieved via drone, helicopter, airplane, or other means is still an extraordinary way for many people to see the world.

There are two general types of high-angle aerial images: vertical and oblique. Vertical angles look directly straight down through empty atmospheric space onto a continuous and often static visual

field at a perpendicular angle. Oblique images have an angled view of things from above. The oblique perspective looks across a landscape from above as it incorporates horizontality and verticality.

Aerial photography is seen everywhere today and is used for a variety of purposes besides journalism, including entertainment, sports, propaganda, map-making, gaming, urban planning, reconnaissance, and surveillance, among others. The focus here is on journalistic applications of aerial photography.

Aerial Photography and Journalism

There is a complex relationship between news images and the audience, particularly in the case of aerial photography. The perspective that it provides redefines an audience's sense of space and identity. Literature in critical-cultural studies has examined aerial imagery through a dystopian lens, due to its use by the military and government for war and surveillance. In general, the scholars who conduct visual studies from a critical-cultural framework argue that the aerial view has a status conferral function for its viewers who historically have been military, security, government, and other state entities.

The kinds of images produced from a high angle are, like all images, created within the subtleties of power relationships and ideology, thus summarizing the critical-cultural perspective of aerial photography. For journalism, the aerial perspective has opened opportunities for aesthetic potential of scale and overall visibility. The use of drones, however, has opened controversial areas regarding privacy versus freedom of the press, liability and the risk of injury to those on the ground, criminal interference with commercial aircraft, and their use for terrorist purposes.

The extreme high angle provided by the aerial perspective gives the viewer a new look at the patterns of human and natural activity on a large scale. New and alternative perceptions of color, shape, and size occur as the camera redefines a viewer's sense of geography and space and how human and natural activity can be impactful for land, people, and communities. The flow of traffic (or lack thereof), the swirling patterns of warm and cold fronts ushered along by the jet stream,

and the path of devastation left from a tornado are given new meanings when imaged from high above.

As a storytelling tool, the aerial perspective may not only have informational qualities but symbolic as well. In documentary films, one infamous example is the use of this shot in Leni Riefenstahl's 1935 film *Triumph of the Will*, which documents a Nazi rally in Nuremberg in 1934. The film opens with an aerial tracking shot of Adolf Hitler's plane as it flies over the city, intercut with shots of the city from the plane's eye view as Hitler presumably scopes out his domain. As a well-planned piece of propaganda, it is considered by many to be one of the most powerful examples of the use of visual images to instill and affirm political beliefs in its audience. This kind of connotative meaning is also associated with aerial photography used in other types of production, including newscasts. The sense of flying over a scene of devastation or a huge crowd is powerful and perceptually places the viewing audience in a position of authority, providing feelings of awe, reverence, or amazement.

Helicopters

One of the better known news stories of the 20th century that used helicopter aerial footage for live, breaking news occurred on June 17, 1994, when a white Ford Bronco containing superstar athlete and actor O.J. Simpson and his friend Al Cowlings (driver) was chased by news helicopters and a large contingent of police vehicles along Los Angeles streets and freeways. The ensuing trial of O.J. Simpson for murder would transfix much of the United States for months to come.

The use of helicopters for journalism, however, evolved from their use in the nonvisual medium of radio. When automobile makers began installing radios in cars, radio traffic reports were created. Early traffic reporting used blimps and airplanes. But due to their unique flight capabilities to hover in place and move quickly from one location to another, helicopters eventually became the aircraft of choice for traffic reporting. But helicopters came with a high price as many reporters lost their lives due to aircraft malfunctions, especially in the early days of helicopter flight.

Helicopter technology has, however, become safer and more high-tech over the years. The news

helicopter went digital in the mid-1990s and into the 2000s. The all-digital news choppers are equipped with cameras inside and mounted on the outside as well. Some high-resolution cameras can read a car license plate clearly from 800 feet away.

Only the largest metropolitan areas can afford and justify the use of a helicopter for newsgathering purposes. Having the ability to cover news using a helicopter is considered prestigious since not all local news stations can afford them. The helicopter, reporter, and driver are often featured in local TV ads for the station and are boasted about in a station's promotional packages. News helicopters often have a pilot and photographer on board and are designed for quick takeoff. On the downside, helicopters are noisy and disruptive to those below, and if the reason for their presence is unknown, there can be cause for anxiety.

Most news organizations lease their news helicopter. Helicopters are very expensive to put in the air, and the hours of use are limited. So, news directors and journalists are cautious about their use and use them only to cover major events such as earthquakes, massive fires, civil rights demonstrations, and other forms of sizable crowd-gathering activity.

Satellites

The views of the Earth from satellites positioned in geostationary orbits have many uses. News coverage of the weather is one of the more recognized uses of satellite imagery. The first images of Earth from a weather satellite were taken by the TIROS-1 satellite (the first in a series of Television and Infrared Observation Satellites) on April 1, 1960. Although it had a short lifespan of 78 days, the potential of satellite aerial photography for tracking weather patterns and hurricanes was evident. Since then, satellite technology has advanced enormously. In addition to providing visual images, satellites also provide data for many environmental and air quality factors using various onboard instruments. Countless lives have been saved by news reports that track the path of destructive weather events.

But satellite imagery has become a useful tool for more than just the weather. Because of the unbiased data they provide for fact-finding and gauging the impact of a particular situation, as

well as the imagery they collect from conflict zones, satellites are an indispensable tool for journalists. Satellite data and imagery has, for example, been used to verify reports of civilian murders by government soldiers in Cameroon in 2018 that the government claimed were committed by separatists. By correlating on-the-ground photos with satellite images of landmarks, reporters were able to prove exactly where and when the incident took place and who was responsible. The government of Cameroon was then forced to issue a statement clarifying their earlier stand and announce that a number of soldiers had been placed under arrest. This need to confirm reports of illegal or criminal activity, to connect the dots, tie up loose ends, or find clues for where and when something happened are important journalistic activities that satellite imagery can assist with.

So, whether it's tracking the expansion and condition of refugee camps in Bangladesh or showing 30 years of change to the Amazon rainforests or the retreat of the polar ice caps due to climate change, the advancements and groundbreaking innovations of satellite technology have ushered in a new era of observing the planet, making satellites important photographic tools for journalists.

Drones

From filming war-ravaged areas to capturing action sports footage, there are numerous examples of drones being used for journalism. Unlike the other aerial platforms used to cover news happening outdoors, drones are small enough that they can also cover events in large indoor spaces. Their ability to provide images in situations when it is too dangerous to use a helicopter, such as the immediate aftermath of severe weather, is an especially useful function. They cover other hard-to-access places as well and are much cheaper to use than helicopters. Whether they have the potential to change journalism is arguable, but they are part of a new set of tools journalists have for storytelling.

Besides the unique aerial perspectives, drones can be used to explore new forms of news reporting. For example, they can be outfitted for 360-degree video and 3D virtual reality, to add

innovative perspectives to news storytelling. They can shoot either video or still photographs. Besides cameras, drones can carry sensors for various other forms of data collection, such as geodetic information, emissions detection, and radio signals that can be used to enhance news storytelling. Drones are also used to explore new forms of image-making, such as multispectral imagery and photogrammetry for creating new stories. As a storytelling tool, they can take the audience to new and hard-to-access places and provide unexpected new insights. One example of how drones can provide poignant aerial perspectives are the drone images of Chernobyl's crippled nuclear reactor and the nearby ghost city of Pripyat 30 years after the reactor melted down that were used in a *60 Minutes* report in 2014.

Several universities have begun to teach drone journalism. The Universities of Nebraska-Lincoln, Missouri, Kentucky, Syracuse, and the Newmark Graduate School of Journalism at the City University of New York, as well as for-profit workshops such as DartDrones offer educational programs on drone journalism. These programs teach students how to fly drones and include instruction on the complicated legal aspects of using drones for journalism.

Laws and Ethics for Drones

In the United States, rule changes governing the use of drones came into effect in August 2016. Issued by the FAA, these rules made it easier for journalists to use drone footage in their work. The new rules state that anyone wanting to use a drone as a certified remote pilot, including as a commercial operator, must register the drone with the FAA, and then pass a knowledge test that covers Part 107 Rules regarding the operation of crewless aircraft. In addition, the person must be at least 16 years old, able to read, write, and speak English, and be in a physical and mental condition to safely fly a drone. A person can also legally operate a drone without being certified if they are directly supervised by someone who is certified.

The easing of regulations was a significant development for photojournalism because it made aerial photography accessible to journalists across the United States. New opportunities as well as new challenges for journalists and regulators alike

were created. Journalists wishing to operate a drone should also check local drone regulations and consider if the way they are using the drone meets the Society of Professional Journalists code of ethics. In general, journalists are advised to respect others' privacy and follow the same journalism ethics that would be followed even if the use of a drone were not involved.

AFRICA, NORTH

The region of North Africa includes Algeria, Egypt, Libya, Morocco, Sudan, Tunisia, and the disputed territory of Western Sahara claimed by both the indigenous Saharawi people and Morocco. The region borders the North Atlantic Ocean to the west, the Mediterranean Sea to the north, and the Red Sea to the east; its population is approximately 234,000,000. Four languages are used institutionally and officially (Modern Standard Arabic in every country of the region;

Tamazight in Algeria, Morocco, and Tunisia; English in Sudan; and French in Algeria, Tunisia, and Morocco); as a whole, the region has numerous dialects of Arabic and Tamazight (Berber).

A unifying factor among the extremely varied countries of North Africa is that each of them was colonized or occupied by a foreign power, which necessarily impacted journalism in each country and particularly the development of local, independent journalism. The countries of the Maghreb were colonized by the French: Algeria (1870–1962); Tunisia (1881–1956); Morocco (1912–1956); Egypt was a British Protectorate (1914–1922) and Libya was colonized by Italy (1911–1943); the British colonized Sudan (1899–1953) and Spain colonized Western Sudan (1884–1975), which has been occupied and administratively controlled by Morocco since 1979 and a northern strip of Morocco was a Spanish protectorate from 1912 to 1958. As noted, Western Sahara continues to be claimed both by Morocco and the indigenous Saharawi people.

The destructive legacies of colonialism and imperialism in North Africa and their impact on independent journalism and freedom of expression is important connective context. The press law of 1881, for example, considered Arabic to be a foreign language in Morocco, Algeria, and Tunisia, and printing in Arabic and importing Arabic newspapers was considered to be a violation of the law.

This entry provides an overview of print, broadcast, and digital journalism in this historically, culturally, linguistically, sociopolitically, and economically diverse region and is organized by examining each form of journalism in the Maghreb (Algeria, Morocco, and Tunisia), the countries of the Middle East in North Africa (Egypt and Libya), and Sudan and the Western Sahara. Each is briefly contextualized historically, sociopolitically, and economically with regard to how these different forms of journalism function within the media ecosystems in which they operate.

Maghreb

Morocco

Located between Algeria and Western Sahara, Morocco has a population of approximately 35,600,000 and borders the North Atlantic Ocean

and the Mediterranean Sea, where the population density is greatest. Print started in Morocco in 1820, and the first paper in the country was Spanish, *Africa Liberal*; the first Arabic newspaper, *Al Maghrib*, appeared in 1886. From the early 19th century until the early 20th century, Morocco saw the publication of numerous newspapers, many of them in French and in Spanish whose aim was to advance colonial agendas and promote the French and Spanish languages. During World War II (1939–1945), the Moroccan nationalist party, the Istiqlal Party, began publishing its newspaper, *Al-Alam* in Arabic and *L'Opinion* in French: both promoted independence and resistance of colonial powers and the French occupation in particular.

Broadcasting began during the 1920s; television appeared in 1954. After independence from France in 1956, different political parties have owned Morocco's newspapers and until the late 1990s, when the first independent newspapers such as *Le Journal*, *Assahifa*, and *Demain* began and started gaining popularity, the most influential daily newspapers were partisan. King Mohammed V's Charter of Public Liberties proclaimed freedom of expression in November 1958, but also included provisions for the government to limit press freedom. The Charter was strengthened in 1960 and 1963 to stipulate that the minister of interior could seize copies of any publication that could be considered a threat to "public order." The king could also ban any publication that was judged to attack the political or religious foundations of the country.

As reported by Human Rights Watch in 2017, since Mohammed VI took the throne in 1999, Moroccans have been imprisoned "solely for their nonviolent speech, under both the press code and the penal code." Journalists have been convicted of defamation and of spreading false news, of advocating terrorism, and citizens have been convicted of insulting the king on Facebook and YouTube. In 2014, political rapper Al-Haqed was convicted of allegedly being inebriated in public and insulting and assaulting police officers after what has been described as an unfair trial and rapper Gnawi was sentenced to a year in jail in 2019 for insulting the police on social media. While in 2016, Morocco adopted its first press code that does not include prison terms for peaceful speech offenses, its penal code continues to punish

nonviolent speech offenses with prison terms, impacting both journalists and nonjournalists. In 2019, the penal code was used to jail human rights activist and freelance journalist Omar Radi for a tweet criticizing a judge.

Reporters Without Borders has characterized Morocco as a “very difficult” country in which to practice journalism, stating that they face “judicial harassment.” Reporting by local and foreign media on migration is off-limits and journalists have been attacked for reporting on the Hirak movement, a protest movement in Morocco’s northern Rif region in 2016–2017 that accused the authorities of corruption and abuse of power. Numerous activists were imprisoned for participating in the protests, as well as journalists, notably Hamid El Mahdaoui. Another journalist who covered the protests, Hajar Raissouni, was detained in 2019 and tried on a charge of having an illegal abortion: sex-related charges, according to Reporters Without Borders, are often used in Morocco to harass individuals who challenge the authorities.

Crackdowns on online journalists and attacks on independent journalists in online governments publications are prevalent, Freedom House reported in 2019. While internet penetration is high, at approximately 20% in the country (approximately 25 million users) there is a wide disparity between urban and rural users. According to a 2016 report of the National Agency for the Regulation of Telecommunications, 67% of urban residents have internet access as compared with 43% of rural dwellers. Approximately 39% of Morocco’s population lives in rural areas.

Algeria

Algeria has a population of approximately 43,000,000 and the country borders Libya, Mali, Mauritania, Morocco, Niger, Tunisia, and Western Sahara. It is geographically the largest country in Africa and in the Arab world, though the majority (80%) of the country is desert. French colonialism dominated the country’s media until independence in 1962: newspapers were predominantly French and served the French colonial administration, with only a few local newspapers published in Arabic. In 1960, when France decided self-determination for Algeria, the French administration

allowed for the publication of some Arab nationalist views; none were permitted before.

After Algerian independence in 1962 under the National Liberation Front, the print media was briefly quite diverse and independent: the National Liberation Front, which had been publishing its newspaper *El Moudjadid* in Tunis, moved its operations to Algiers in 1962. With the proclamation, however, of Algeria as a one-party state in 1963, newspapers and other forms of media fell under regime control and remained so until 1989.

Freedom House has characterized Algeria as “not free” in the majority of its annual reports beginning in 1972; its 2020 report described most publications as wholly dependent on government agencies for printing and advertising and encouraged self-censorship. Online and foreign publications are sometimes blocked by the authorities, as in June 2019 when the government banned access to the online news outlets *Tout sur l’Algérie* and *Algérie Part* and the authorities regularly “harass the media and censor or punish controversial reporting.”

Tunisia

Tunisia is located between Algeria and Libya, bordering the Mediterranean Sea, and has a population of approximately 11,800,000, the majority of whom live in the north of the country. Tunisia’s publications were historically owned and controlled by political parties, but the 2011 Jasmine Revolution transformed the media landscape and saw the creation of many independent news outlets, a new press decree (Decree-law 115/2011) declaring “freedom of exchanging, publishing and receiving news and views of all kinds.” In 2017, an Independent Press Council was established to address press freedom and create a code of journalistic ethics that would address issues of regionalism and racism in the media. Yet as expressed by Reporters Without Borders, there is concern about how slowly new media legislation is being drafted, and reporters covering the security forces especially face pressure and intimidation from the authorities about their work.

Egypt and Libya

Egypt borders the Mediterranean Sea and the Red Sea and includes the Sinai Peninsula, connecting

Africa and Asia. Egypt is one of the most densely populated countries in the Arab World, and the third most populous country in Africa with a population of an estimated 102,334,404.

There is a diverse range of newspapers in Egypt within the more than 20 published in the country: state-owned dailies, opposition dailies, party newspapers, regional newspapers, and private newspapers published in English. *Al-Ahram* (The Pyramids), is the largest and oldest news organization in Egypt, founded in 1875 and nationalized in 1960, part of the government-owned Al Ahram Foundation, a printing, publishing, and advertising group. The country's most influential independent newspapers were founded in the early part of the 21st century, including the daily *Al-Masry Al-Youm* (The Egyptian Today) founded in 2004 and *Al-Dustour* (The Constitution), founded the same year as a weekly, and then becoming a daily in 2007. Both newspapers were important critics of the Hosni Mubarak regime, publishing investigative pieces on the regime's human rights abuses and corruption, and were vital to reporting on the strikes and other organized labor activism that took place in Egypt between 2004 and 2008. In English, Al Ahram publishes the *Al Ahram Weekly* and in French as *Al Ahram Hebdo*. *The Egyptian Gazette* is another English language, government-owned publication; the *Daily News Egypt* is an English language independent print newspaper. By 2010, the majority of these and other newspapers had digital editions and had incorporated social media into their newsrooms.

Censorship of independent newspapers and the detention of independent newspaper journalists, photojournalists, and editors as well as journalists, photojournalists, and editors working in online publications is an ongoing problem in Egypt. Although Egypt's constitution includes several articles, specifically Articles 65, 68, 70, 71, and 72, that ban censorship and mandate media transparency, independent regulatory bodies, the right to establish media outlets, and the right to free access to information, Egypt's penal code includes several articles that allow for the jailing of journalists. According to the Committee to Protect Journalists, since 2012 the charge of false news has been applied prolifically by Egyptian President Abdel Fattah el-Sisi. According to the International Press Institute, more than 60

journalists were imprisoned in Egypt in 2020, the majority with terrorism-related charges and many with the charge of false news as well. In July 2020, journalist Mohamed Monir died in Tora Prison of COVID-19; he had been charged with broadcasting fake news after appearing on Al Jazeera TV, the Qatari-owned channel that the Egyptian government banned in 2013, during the rule of the late former president Mohamed Morsi.

Many other accounts of repression of journalists and free speech have been chronicled in 2020: the raid of the Turkish Anadolu News Agency's Cairo office and arrest of at least four of its journalists; the detention and arrests of four journalists who covered the COVID-19 pandemic; the arrest of Lina Attalah, editor in chief of the prominent independent investigative online news publication *Mada Masr*; the detention of two freelance journalists, one of whom was charged with spreading false news and the other who was detained without charges being disclosed by the authorities; and the arrest of Mostafa Sakr, publisher of the *Daily News Egypt* and the *Al-Borsa* Arabic financial publication and owner of Business News for Press, the papers' parent company.

During the 1960s, the Egyptian government launched television, more than 40 years after Egypt became the first Arab state to have radio service in the 1920s and more than 30 years after the government established Egyptian Radio in 1932. The largest media organization in the country is the Egyptian Radio and Television Union, with nine television stations, six regional television stations, and 70 radio stations. Egyptian Radio and Television Union has no actual separation from the government and has been criticized as being too supportive of presidents Hosni Mubarak, Mohamed Morsi, and Abdel Fattah el-Sisi. Egyptian television dramas (*musalsalat*) have been important since the 1970s, not only for their commercial and popular success but also for the range of social, economic, and cultural values they portray. According to a Broadcasting Board of Governors report in 2014, despite the rise of digital media, television is the most popular medium in Egypt, where approximately 20% of the population is illiterate and more than 98% of Egyptians have a television in their home.

Libya

Libya borders the Mediterranean Sea between Egypt, Tunisia, and Algeria and is the fourth largest country by land mass in Africa. The vast majority (90%) of the population of approximately 6,871,000 lives along the Mediterranean coast, between Tripoli to the west and Al Bayda to the east; the interior is sparsely populated due to the lack of water and the Sahara Desert. Like the other countries of North Africa, Libya was under the rule of a foreign power for many years, colonized by Italy from 1911 to 1942 and then divided between the French and British until its full independence in 1951.

As in the rest of North Africa, colonial domination affected the development of journalism. Until Libya's independence in 1951, the Italian colonizers controlled the press and issued newspapers in Arabic and Italian, with little room for Libyan-owned or Libyan-run newspapers until 1951. Television and radio stations broadcast primarily in English and in Italian, with the majority transmitting from British, American, and Italian military bases. When Mu'ammar al-Qadafi took power in 1969 in a military coup, he created his own political system that combined socialism and Islam based on local practices and the official name of the country became the Great Socialist People's Libyan Arab Jamahiriya.

The number of Arabic language television and radio programs increased after he took power, as did attention to the role of mass media. During al-Qadafi's rule (1969–2011), he used the media to disseminate his own views and his government owned the majority of Libya's print and broadcast media, which it strictly controlled, as it did the official state news agency, Jamahiriya News Agency. In 1972, legislation was introduced (and remained in use in the country until 2011) that stated that journalists and writers could express their opinions as long as they agreed with Libyan society's values. Journalists could only report information and views sanctioned by al-Qadafi, so they exercised strict self-censorship, fearing questioning and possible arrest by agents of the intelligence apparatus. In 2004, al-Qadafi's son Saif al-Islam introduced some liberalizing measures, including increased access to the internet and the creation of new Arabic satellite channels.

Still, under al-Qadafi, there were some reporting topics that were strictly off-limits as outlined by Reporters Without Borders: Islamism and discussing the application of Sharia laws; political corruption; discussion of different ethnic groups within Libya, such as the Tabu and Berber, which was viewed as distracting from national unity, and Libya as an all-Arab nation. Reporting on these issues could be met with a range of brutal punishments, from jailing to kidnapping, from disappearing and torture to outright murder, as in the case of freelance journalist Daif al-Gahzal al-Shuhaibi who had been reporting on regime corruption and was murdered in 2005 after being briefly detained and questioned by security agents.

After al-Qadafi was deposed by a popular uprising in 2011, Libya's media landscape underwent a brief but meaningful transformation, according to Human Rights Watch and the Committee to Protect Journalists: private and independent publications, virtually unknown in Libya before the uprisings, increased greatly. The number of daily publications rose from four daily newspapers to hundreds of diverse publications, news websites, and blogs reported by newly publicly active citizen journalists. The number of television stations broadcasting from within and outside Libya grew from two to more than 50, and 30 new radio stations were created. At the same time, the 2011 uprisings and ensuing civil war was perilous for journalists covering it: eight journalists died covering them, including photo-journalists Chris Hondros and Tim Hetherington and Al-Jazeera cameraman Ali Hassan al-Jaber. James Foley, who was kidnapped in Syria in 2012 and beheaded there in 2014, was attacked in Libya in 2011 along with Spanish photographer Manu Brabo and American reporter Clare Morgana Gillis by forces loyal to al-Qadafi. Citizen journalist Mohammed Nabbous, who created the Libya al-Hurra ("freedom") livestream channel to report on the uprisings and the al-Qadafi regime, was also killed in 2011, thought to have been shot by an al-Qadafi-backed sniper.

Since 2011, Libya has been rife with internal conflict: militias with different political, tribal, and geographic allegiances have attacked each other and civil society activists, according to Freedom House's 2020 country report. Most Libyan media outlets are highly partisan, promoting the side they support in

the ongoing armed conflict. According to a 2019 U.S. Department of Justice report, the ongoing violent national crisis has negatively impacted online freedom and access in Libya, and Reporters Without Borders describe political and military actors in the country as “news censors.” Internet penetration is relatively high in the country, at approximately 75% as of 2020; Facebook is an important news source for many Libyans, but internet access and speed are intermittent and the conflict has damaged the country’s internet infrastructure. Journalists active online regularly self-censor due to fear of harassment and a 2006 law mandates that websites registered with the “.ly” domain must not contain content that is “obscene, scandalous, indecent, or contrary to Libyan law or Islamic morality.”

Western Sahara

The population of Western Sahara is approximately 650,000 and the territory is primarily and historically under Moroccan control since the territory gained independence from Spain in 1975.

In 2019, Reporters Without Borders published a report on the media in Western Sahara, describing it as “a desert for journalists” and described journalism as one of the many victims of the conflict between the Moroccan occupied areas, the Polisario Front, and refugee camps in Tindouf, Algeria. Despite what the organization described as Morocco’s repression of journalists, Sahrawi reporters have been working to report independently from the territory, challenging Morocco’s repression of reporting on any issues relating to the territory’s independence or human rights abuses. As in Morocco, there is, according to Reporters Without Borders, constant concern about online surveillance, especially regarding topics related to the territory’s independence from Morocco. As of 2020, approximately 5% of the population are active internet users.

AFRICA, SUB-SAHARAN

Of Africa’s 54 countries, the 46 countries south of the Sahara, geographically labeled sub-Saharan Africa, are situated within a diverse cultural, ethnic, and lingual milieu of an estimated 1.07 billion people in 2018. Among these 46 countries, the liberalization of the media has been at the center of debate since a wave of democratic reform swept through the region in the 1990s. Within this wave of democratization, authoritarian one-party regimes yielded to multiparty systems in most African states. At the onset of democratization, a wide range of media reforms surfaced with countries opening up and deregulating their media sector. This entry offers a brief overview of colonial-era press and anti-colonial activism. The entry also discusses the development of the sub-Saharan media landscape, the dual-media structure found in most countries in the region, training for African journalists, and various professional journalistic organizations. The entry closes with a look at legal and other constraints related to free press and free expression in sub-Saharan Africa.

While democratic progress and modest improvements continue as of 2021, there are still increasing threats to press freedom from the political systems in countries ruled by

long-lasting autocrats who block or stifle free press and subject members of the media to various forms of intimidation and violence. For example, Cameroon (Paul Biya has been in office for 36 years.), Togo (Eyadéma, a family dynasty holding power since 1967), and Uganda (Yoweri Museveni has been in office for 32 years.) have all found a myriad of ways to muzzle press freedom. According to Amnesty International, in 2015, Sudan's National Intelligence and Security Service interrogated around 25 journalists and confiscated at least 20 newspapers editions on 45 different occasions. In 2018, Eritrea had 16 journalists behind bars making it the country in sub-Saharan Africa with the most journalists imprisoned. And in January 2020, a court in Burundi sentenced four journalists to 2½ years in prison on charges of trying to undermine state security.

The Colonial-Era Press and Anti-Colonial Activism

With the exception of Ethiopia, almost all African countries were colonized by one of seven European powers (Britain, France, Germany, Belgium, Portugal, Spain, and Italy). Out of this colonialism and missionary activity, the region's first newspapers evolved. By the late 19th and early 20th centuries, three press systems emerged: one was owned by churches and was expressly intended for spreading the Christian gospel and reaffirming colonial rule; the second, a local or foreign-owned press; and the third, an African-owned and African-financed press—sometimes with missionaries' financial support. Of note, the colonial structure (especially in the British colonies) allowed a free and independent press, though not without some government control. Fearing the rising anti-colonial press, the British colonial administration began to codify press laws addressing sedition and defamation, requiring newspaper registration and the posting of a bond to publish a single newspaper. While each colonial power established its own method of administering its colonies, they shared a common view of Africans as simple and even subhuman. Without careful control, they feared newspapers might easily excite this semi-barbaric population that greatly outnumbered whites and led to a backlash against colonial authority.

By the mid-20th century, the African press grew exponentially as anti-colonial movements arose. Newspaper editors and journalists became heroes for their fortitude to stand up to colonial governments, even if it meant being imprisoned. These actions gave them celebrity status, boosted newspaper sales, and enhanced the platform on which to organize resistance. As a result, several journalists were charged with sedition and were either heavily fined or imprisoned.

As leaders in the resistance movements, after achieving their country's independence, many became Africa's first heads of state. Nnamdi Azikiwe, a radical journalist and later the first President of Nigeria, established the *West African Pilot* in 1937. By the 1950s, he controlled 10 newspapers. Ghana's first Prime Minister, Kwame Nkrumah, used his newspapers, *The Accra Evening News*, the *Daily Mail*, and the *Sekondi Morning Telegraph* to proclaim his rallying cry for decolonization. Jomo Kenyatta, first Prime Minister and President of Kenya, established *Mwigwithamia* in 1928. The leader of Tanzania African National Union (TANU) and the first President of Tanzania, Julius Nyerere, was the editor of the party organ, *Sauti ya TANU*.

Once independent from European rule, most lacked the prerequisites for pluralistic democracy upon which press freedom is built. Consequently, the political systems that arose were often authoritarian and resembled the former colonial regimes. In terms of the press, colonial governments made little effort to establish a legacy of Western libertarian press freedom. For the first 30 years of independence, most media became integrated into the party and government structure, relegating journalists and editors to the civil service.

Media Landscape

The democratization wave of the 1990s led to two significant developments: a rising conscientiousness and articulation of press freedom and a significant increase in independent media. On May 3, 1991, the Windhoek Declaration on Promoting an Independent and Pluralistic African Press, adopted by African journalists in Namibia and later endorsed by the General Conference of the United Nations Educational, Scientific and Cultural Organization (UNESCO), concluded that an

independent, pluralistic, and free press was essential to the development and maintenance of democracy in a nation, as well as for its economic development. A year later, the Charter for a Free Press, adopted by journalists at a conference sponsored by the World Press Freedom Committee, began by stating that a free press meant a free people. In 1993, the UN General Assembly proclaimed World Press Freedom Day as a means to raise awareness of the importance of press freedom in strengthening democracy and fostering development around the world.

The Windhoek Declaration and subsequent pronouncements lent support to the democratic transitions that were forcing authoritarian rulers in most sub-Saharan nations to undertake a growing range of political reforms. By the end of the 1990s, some 42 nations entered a new era of multiparty democracy culminating with constitutional reforms that included freedom of the press and expression. In essence, the gathering in Windhoek marked the beginning of a solidarity movement of journalists, editors, and media owners and the emergence of media development organizations across the continent.

With newfound political freedoms came extensive media reforms. CNN International, Canal France International, Radio Television Portugal Africa, the Discovery Channel's Europe, Middle East, Africa, and BBC World became household names. A proliferation of independent and community media, especially radio, also emerged as a source for news and information. In 1985, there were only 10 independent (nongovernment owned) radio stations in all of sub-Saharan Africa. By 2019, the radio market in Kenya was close to saturation with 117 radio stations throughout the country. Subsequently, there was a surge in community radio. Mali has one of the strongest community radio networks with 110 private radio stations; 86 are community radio mostly rurally based. Of the 122 licensed radio stations in South Africa in 2005, nearly 90 were community stations. By 2019, community radio had increased to 250.

One growth area taking sub-Saharan Africa by storm relates to the economic and media ties that bind China and sub-Saharan Africa. The Chinese-owned StarTimes Group is now operational in 30 countries and has established subsidiaries in

Rwanda, Kenya, Nigeria, Tanzania, Uganda, Mozambique, Guinea, the Democratic Republic of the Congo, and South Africa. It is the fastest growing and the most influential digital TV operator. By 2015, it began to play a major role in digital migration. But China has had some competition from a South African media company launched in 1985 as Africa's first pay TV channel, M-Net, which would eventually become MultiChoice Africa. By the end of 1995, the company has been present in all sub-Saharan countries with millions of subscribers. However, many of their program offerings are simply an African version of American or British programs: *Survival Africa*, *Who Wants to be a Millionaire?*, *Catwalk Kenya*, and *Idols in Africa*, with soap operas such as *Egoli: Place of God* having a distinct African flavor. In May 2003, M-Net's DSTV launched Africa's first international-format reality program, *Big Brother Africa*, to audiences in 42 sub-Saharan African countries with an estimated viewership of 30 million.

Regional newspapers are still concentrated in urban areas where literacy is higher and distribution, easier. Countries with growing economies and relatively stable democratic institutions such as South Africa, Senegal, and Mozambique have strong newspaper markets. In other countries (e.g., Uganda and Zambia), newspaper growth is sluggish due to market stress and government policy. Countries hostile to private media, such as Eritrea, have seen newspapers shuttered. There are, however, other factors that put newspapers at risk. For one, many newspaper entrepreneurs entered the market during the democratization wave with little understanding of the news business and were, therefore, unable to make a profit. Many of these newspapers have been short-lived. Six years after Côte d'Ivoire returned to multiparty governance in 1996, 187 newspapers were being published. By 2017, there were more than a dozen French-language newspapers published in Abidjan that are typically read by the educated and affluent class, *Fraternité Matin* (a state-owned daily paper with the largest daily sales), and three additional dailies serving as the official mouthpieces of Côte d'Ivoire's main political parties: *Notre Voie*, *Le Patriote*, and *Le Nouveau Réveil*. Four additional newspapers present voices of moderation: *Fraternité Matin*, *Soir Info*, *L'Inter*, and *L'Intelligent d'Abidjan*.

Due to limited penetration, the Internet is not yet posing a serious competitive threat for newspapers. What the Internet has done, however, is provide a platform for both independent and state-owned and state-operated media to put forth their own positions for the global market. Therefore, almost all media organizations in the region, regardless of their editorial stance, ideological leanings, or political affiliation, have an online presence and regularly update their content. Probably the biggest and best known international newspaper, South Africa's *The Daily Mail & Guardian*, was Africa's first online newspaper, launched in 1994.

Certainly, the Internet has reshaped the media. By 2000, all countries had secured access, at least in their capital cities. As personal computer penetration is low, users rely on cybercafes, telecenters (public places that offer Internet access), schools, and other public facilities. But sub-Saharan Africa still lags behind the rest of the world, which according to a 2019 Pew survey has a 23% penetration rate. Internal disparities are also huge. Namibia, with an estimated population of 2.6 million in 2019, has a 51% penetration rate and 570,000 Facebook subscribers. Mauritania, which has a population of 4.6 million, has a 2% penetration rate with 770,000 Facebook subscribers. In addition, the rural population has not yet benefited from any of these new communication technologies.

However, the largest growth in telecommunication has been in the mobile market, with a growth of about 50–60% annually. Mobile technology is having a great impact on journalists who were previously hampered by poor communication infrastructure. Today, mobile technology provides an expedient and cost-effective way for journalists to send images, news video clips, and news reports back to the newsroom.

In terms of news agencies, the South African Press Association (SAPA), founded by several urban newspapers in 1938, is one of the oldest in the region. Indeed, the South African model is rare. In the postindependence period, governments established their own newsgathering agencies, whether they followed a one-party state or multiparty democratic forms of government. Following its independence in 1990, and with the establishment of multiparty democracy, the

Namibian government created the Namibia Press Agency (NAMPA), which it owns and operates. Journalists working for government agencies such as NAMPA have long been accused of practicing self-censorship. In other countries, news agencies originally established to control the spin from the one-party state governments have undergone a metamorphosis since the 1990s. One year after Angola gained its independence from Portugal in 1975, the Angola Press Agency (ANGOP) was created as the propaganda instrument of the one-party state. However, after further democratization and the introduction of a multiparty system in 2002, ANGOP became a provider of news for all media in the country. With the help of UNESCO, ANGOP was transformed from a state-owned and state-controlled agency to a public enterprise.

Media Structure

Whether involving news agencies, broadsheets, tabloid newspapers, or electronic media, the pattern evident in most sub-Saharan African countries is that of a dual-media structure: state-owned and state-controlled media along with privately owned media. This does not mean that such a structure is always harmonious and does not foment conflict. Depending on the system of government, independent media face overwhelming obstacles and can be censored or forced out of business at any time. Where repression exists, new communication technologies have opened space for bloggers and others to develop alternative voices to state media institutions. Zimbabwean journalists who found themselves restricted from practicing their profession launched the ZimOnline News Agency in 2004, as part of an effort to establish just such an alternative voice.

Regardless of government interference, private ownership is changing the media landscape. The emerging pattern is one of concentrated ownership and conglomeration among local and foreign interests. In Kenya, the Royal Media Services (the largest private radio and television network in East Africa) own multiple media platforms including two TV stations (Citizen TV, which broadcasts in English and Kiswahili to audiences in Kenya, and Ramogi TV), 14 radio stations of which 12 are vernacular, a video on demand platform (Viusasa), two national and 11 vernacular radio

stations, Inooro TV, Radio Citizen, The Leader newspaper, and eight local-language radio stations. Two major publishing houses, Nation and Standard, dominate the print media.

Following the dismantling of apartheid in 1994, the foreign-owned Independent News and Media bought the controlling share in the Argus group publishing empire. In 1996, Johnnic Communications (now Avusa) acquired control of newspaper publisher Times Media Limited, making it the biggest Black-owned media company in South Africa. In 1998, Caxton Publishers bought the controlling share in media and publishing corporation Perskor and consolidated its focus on community newspapers and free news sheets. South Africa's MIH Holdings—a multinational media company, with its major operations in electronic media, including pay TV, Internet and instant-messaging subscriber platforms, and related technologies, has spread to the 48 sub-Saharan African countries. MIH also has print media interests in Nigeria, Kenya, and Angola.

Training

Independence from colonial rule clearly demonstrated that a void existed in Africa's media infrastructure and that journalists needed training. In most countries, there were no schools of journalism and no tradition of formal journalism education or systematic training. On-the-job training was and is the preferred model as of 2021, and continues to be the model preferred by newspapers, which have resisted formal training of journalists.

There are several models of journalism training available throughout the region. One is the workshop model for practicing journalists, which emphasizes a particular set of skills such as investigative reporting, wildlife and conservation reporting, climate change reporting, and reporting on illicit finance. These workshops, usually funded by donors and in partnership with a local nongovernmental organization (NGO), involve a limited number of participants and are conducted in the host country, interregionally, or in the donor's country. Another approach is vocational institutes that offer 3-year diplomas in journalism, such as the Evelyn Hone College in Zambia and the Polytechnic of Namibia. Recognizing the need for

in-country degree training at the university level, several countries—even those that gained independence in the early 1960s—established undergraduate degree programs. Nnamdi Azikiwe, the first President of Nigeria, saw the value of linking journalism education to a university and imported the American land-grant university model to the University of Nigeria Nsukka, thereby instituting Nigeria's first university journalism program. With 30 universities offering journalism training as of 2006, Nigeria had the highest number of university journalism degree-granting training entities in sub-Saharan Africa, followed by South Africa with 10. The pan-African training program, the Bloomberg Media Initiative Africa, was established in 2015 by the U.S. billionaire Michael Bloomberg and targeted mid-career journalists and working professionals in business, government, and civil society.

However, across the region, journalism training institutions face a number of challenges. In the UNESCO report, *Criteria and Indicators for Quality Journalism Training Institutions & Identifying Potential Centres of Excellence in Journalism Training in Africa*, journalism professors Guy Berger and Corinne Matras outline the challenges these institutions face: shortages of staff, the need for PhD qualifications among full-time faculty, insufficient scholarships for disadvantaged students, underequipped facilities, insufficient funding, out-of-date curricula, lack of funds to replace and update computers and lab equipment, insufficient web knowledge, and poor Internet connectivity. Another challenge is sustainability. The Nigerian Institute of Journalism, for example, closed in 1999, due to a disagreement about the status of the institute and its programs, only to reopen 4 years later.

Professional Organizations

Another striking feature of the democratic transformation is the rise in professional associations. These organizations follow several patterns with varying agendas and levels of success. There are a few subregional organizations, such as the Media Institute of Southern Africa (MISA) established in 1992, which represent 14 southern African countries. Launched in 1997, the Media Foundation for West Africa (MFWA)

represents the 16 West African countries. Congolese journalists established Journalists in Danger (JED) to monitor and defend press freedom in the Democratic Republic of the Congo in 1998. The JED expanded its work to eight French-speaking countries by 2003. Regional organizations see their common mission as that of being advocates for press freedom and raising professional standards through training. Well organized and with a range of global media partners and national branches or collaborators within each country, they have a good track record in terms of monitoring constitutional press infractions by governments, disseminating annual reports on the state of the media.

In addition, professional journalistic associations and unions in many countries found it difficult to sustain these organizations as well as their level of power within the government structure. Some of these organizations pre-date the democratic wave. The Ghana Journalist Association (GJA), established in 1949, was incorporated into the state apparatus by then-President Kwame Nkrumah. Under the leadership of Kabral Blay-Amihere, the GJA changed its direction in the early 1990s to include journalists across sectors and has since become an independent organization for professional training and networking. Benin's Union of Private Press Journalists, established in 1966, brings together journalists working in the public press (state-owned). Since the wave of democratization in the early 1990s, more than 25 organizations have been established in Benin, each catering to various specialized journalists (e.g., cultural, economic, environmental, and parliamentary journalists).

Some organizations cater solely to journalists working in the private press, such as Mali's Association des Editeurs de la Presse Privée du Mali. Others are gender-specific, such as the Uganda Media Women's Association that was created in 1983 as an NGO for women journalists from government and private media. Science writers from Nigeria, Kenya, Ghana, and Uganda have partnered with the Canadian-based World Federation of Science Journalists to develop their own organization. In other instances, the media and communication sectors remain vulnerable to systemwide pressures.

Legal and Other Constraints

Although the majority of sub-Saharan nations have adopted constitutions guaranteeing free expression and a free press, these protections are often limited through legislation inherited from colonial and early nationalist regimes. The MISA suggests that in Swaziland, there are at least 32 pieces of legislation that have constrained constitutional guarantees of press freedom, some dating back to 1938. While press freedom is constitutionally guaranteed in Equatorial Guinea, the government severely restricts freedom through a 1992 press law, which authorizes government censorship of all publications. In 2006, the U.S.-based Committee to Protect Journalists ranked Equatorial Guinea as one of the five most censored countries in the world. Criticisms of the president (who came into power in 1979) are not tolerated, and self-censorship among journalists is the norm.

Perhaps the most damaging colonial holdover are the so-called insult laws, a form of criminal defamation. Once designed to shield kings from dishonor, these laws make it a criminal offense to insult the honor or dignity of a public official in all but five sub-Saharan countries. In the first 5 months of 2007, insult laws led to the harassment, arrest, or imprisonment of more than a hundred journalists in 26 African countries. In mid-2007, the International Federation of Journalists launched the "Africa Journalist out of Jail Campaign," calling on African leaders to release journalists imprisoned in Ethiopia, Eritrea, and The Gambia. The World Association of Newspapers and the World Editors Forum in their Declaration of Table Mountain also issued a similar call against insult laws.

Even in countries with a relatively free press, criticizing the government can backfire. In March 2001, the Namibian government banned all government advertising and prohibited any government department from purchasing the independent daily *The Namibian* as a result of it being too critical of government policies. In June 2007, the government of Lesotho banned all state and semi-government agencies from purchasing advertising in the privately owned weekly *Public Eye*. Given the relative dearth of commercial advertising in much of the continent, this type of economic pressure has a strong and immediate impact on targeted media.

As of 2021, the African press is in a quandary because both government officials and journalists operate within two opposing press ideologies. Governments require loyalty from the media, whether public or private. Since independence, African leaders have argued that to avoid political instability, media should work in partnership with the government to achieve national development objectives. The partnership model generally works well within state-controlled media where journalists tend to appear as public relations specialists. However, independent media tend to model their professional ethics around the libertarian Western model of a free press that calls for freedom from state intervention. But the state continues to interfere with the work of the press. With the advancement of technology, and as journalists place news online, governments in sub-Saharan Africa participate more and more in digital blackouts. The first known Internet blackout occurred in 2007 when the Guinean president ordered the Internet shutdown following protests calling for his resignation. Using fake news, viral misinformation, and the inability of journalists to verify information, approximately 21 sub-Saharan countries were completely or partially shut down.

Journalists continue to face a myriad of conditions that impact their careers including low wages, poor working conditions, lack of professional training, and a culture of secrecy and self-censorship. Aside from these obstacles is the “brown envelope” syndrome. This is a widespread practice wherein journalists accept bribes or routinely seek payments from the individuals or organizations they cover. As is often the case in government and business, journalists contend that low salaries drive such unethical practices.

Across sub-Saharan Africa, self-regulation through codes of conduct is becoming the norm for encouraging high professional and ethical standards. Some countries, such as South Africa, have multiple codes for newspapers (*The Mail & Guardian's* Professional Code, *Business Day and Financial Mail*, *Die Burger*), television (South Africa's first private free-to-air television channel), professional organizations (the South African Union of Journalists and South Africa National Editors' Forum), state regulatory bodies (the Independent Communications Authority of South

Africa), and those concerned with national health issues (Reporting on HIV/AIDS: Ethical Guidelines for South African Media). Similarly, Tanzania has varied codes of conduct for media managers and editors, journalists, news agencies, and media photographers. There are also subregional codes of ethics. The East Africa Free Press Assembly adopted an East and Central African Code of Ethics in 2001, which was reaffirmed in 2002. Additional codes of conduct can be found in Rwanda, Angola, Kenya, Zambia, Malawi, Namibia, and Zimbabwe.

Given continued ethnic strife, a rebirth of authoritarianism in a number of states, massive diversity across the region, the struggle to create and maintain democratic governance that many countries are experiencing, and various legal impediments, press freedom in sub-Saharan Africa remains a constant struggle. Despite these challenges, journalists have built organizations that support a free and independent press as well as self-regulatory bodies to promote and maintain professional standards.

The developments associated with the 1990s wave of democratization transformed the media in most countries from a predominantly state-owned and controlled propaganda tool to a more open and independent media. However, within this open system, there is a myriad of ways in which individual countries have responded to the liberalization and privatization of the media. The news and broadcast media are undergoing immense growth in sub-Saharan Africa. Yet there is a digital divide that separates sub-Saharan African countries from each other and the rest of the world. Mobile technology is rapidly expanding, and journalists are reaping the benefits of this technology.

Most newspapers (government or privately owned) have an online presence. Conglomeration and convergence are shaping the media industry in many countries. As of 2021, broadcasting formats and programming imported from North America, Europe, and China continue to shape the cultural discourse. And despite commonalities, there is not a one-size-fits-all media model. Sub-Saharan Africa has a varied media landscape in terms of media choice, accessibility, levels of government intrusion, and the legal and economic structures in which they operate.

AFRICAN AMERICAN NEWS MEDIA

African American news media have always focused on reporting the good, bad, and ugly in and affecting the African American community. In recent years, the rising cost of newsprint, reductions in advertising and paid circulation, downsizing of newsroom employees, the advancement of technology (radio, television, and the World Wide Web) for the presentation of news, and the closing of newspapers around the country have adversely affected the expansion and continuance of print media, especially African American print newspapers and magazines. This entry discusses the origins and development of the Black press in the United States, associations and news services involving African American news media, and contemporary African American news media.

Beginning of the African American Fourth Estate

The Philanthropist, founded in Mount Pleasant, Ohio in August 1817 and published and edited by Charles Osborn, has been described as the first abolitionist newspaper in the United States. The first newspaper owned, edited, and published by African Americans was *Freedom's Journal*. Presbyterian minister Samuel Eli Cornish and his partner John Brown Russwurm founded the paper so Negroes could have an avenue to stimulate intelligence and be encouraged to vote, to get a proper education, and become self-reliant, upstanding religious citizens.

Two years after the birth of *Freedom's Journal*, it folded. Two months later, its successor, *Rights of All*, was born with Cornish as its editor. The monthly publication, with its emphasis on equal rights for colored people, lasted 6 months.

Throughout the 1800s, Negro papers were published weekly and monthly across the young nation. Some lasted months, while others lasted years. They included *Weekly Advocate* (1837), which later became the *Colored American* (1837–1842), *Mirror of Liberty*, *National Reformer*, the *Struggler*, *People's Press*, the *Evangelist*, *Ram's Horn*, and *Mirror of the Times*.

Mirror of the Times was established in 1855 in San Francisco. In 1862, the paper merged with *Pacific Appeal*. The merged papers lasted more than 8 years, from April 1862 to June 1880.

The Mystery was first published in September 1843 in Pittsburgh. About 1,000 copies were printed for the first issue. The four-page weekly antislavery newspaper lasted 4 years. It was the first Black newspaper in the state of California and the first one established west of Kansas. The publisher, Martin Robinson Delany, was a Harvard University graduate who later became a medical doctor and an author.

In October 1864, *La Tribune de la Nouvelle Orleans* (*New Orleans Tribune*) was the first Black bilingual daily published in the United States. Twenty-four years later, the *Freeman* of Indianapolis, Indiana, became the first African American newspaper to reach audiences across the nation. The Savannah, Georgia *Colored Tribune* was first published on December 4, 1875 and changed its name the following year to the *Savannah Tribune*. The newspaper, which continued to be published as of 2021, stopped publication only from 1878 to 1886 and from 1960 to 1973.

Christopher James Perry Sr. established the *Philadelphia Tribune* in 1884 and operated the paper for 37 years before turning it over to his son-in-law, Eugene Washington Rhodes. Before his death in 1921, Perry served three terms on the Philadelphia City Council. Rhodes, who was a trained lawyer, operated the *Philadelphia Tribune* for 49 years.

In August 1892, three Baltimore newspapers with religious foundations became one. The *Ledger* was run by George F. Bragg who also was the

pastor of St. James Episcopal Church. The content focused on church and community news. The *Sunday School Helper* promoted and encouraged Sunday school leaders. John H. Murphy Sr., an ex-slave and Union Army sergeant, started the paper while serving as Sunday school superintendent of St. John A.M.E. Church. The Rev. William N. Alexander, pastor of Sharon Baptist Church, established the *Afro-American* to advertise his church and community events and issues. Once the three newspapers were merged, they published under the name of *Afro-American*.

The first two decades of the 1900s would see the birth of three newspapers that eventually would be known throughout the United States and abroad.

First, Robert Abbott Sengstacke began publishing the *Chicago Defender* on May 6, 1905. The *Defender* quickly built a reputation through famous writers and contributors, including Gwendolyn Brooks, Langston Hughes, Ethel Payne, and Ida B. Wells (later known as Ida B. Wells-Barnett). Second, James H. Anderson published the four-page *New York Amsterdam News* on December 4, 1909. The paper sold for a penny and after World War II, its reported circulation was over 100,000 copies. Third, William A. Scott II founded the *Atlanta Daily World* in 1928. (Decades later, the Atlanta newspaper would be purchased by Real Times Media of Detroit, Michigan.)

Throughout the years, owners, publishers, editors, and readers of African American dailies, weeklies, and monthlies filled the pages with news from African American churches, schools, social clubs, and fraternal groups, concerning issues of education, jobs, transportation, economics, politics, and civil rights.

Freed Slaves Become Journalists and Freedom Crusaders

Frederick Douglass and Ida B. Wells-Barnett were born slaves. Douglass was born to Harriet Bailey in 1818, or some records say in 1817, in Maryland. Years later he would change his name to Douglass. At the age of 10, Douglass was sent to live with his slave owners' family in Baltimore. The mistress of the house, illegally, taught him how to read and write until her husband found

out about it. In 1838, he escaped slavery and first fled to Philadelphia and later to New York City.

Abolitionist and journalist William Lloyd Garrison encouraged Douglass to publish his writings and letters in newspapers denouncing slavery. In 1845, Douglass published his autobiography, *Narrative of the Life of Frederick Douglass*. (In 1882, it was revised as *The Life and Times of Frederick Douglass*.) Also in 1845, the great orator traveled to Europe to give talks against slavery and while there his Quaker friends raised \$750 and bought his freedom.

In 1847, Douglass became editor and publisher of the *North Star*, published in Rochester, New York. Its editorial focus was to attack slavery and advocate for emancipation of those who were enslaved. When the *North Star* was published, the cost of a subscription was \$2 a year if paid in advance and an extra 50 cents if paid within 6 months. However, Douglass' personal investment from his fees earned from his writings, published books, and speaking engagements, ultimately wouldn't be enough to keep the newspaper financially solvent. Most African Americans were too poor to afford the \$2 or \$2.50 and far more were illiterate and couldn't read the paper. In 1851, the *North Star* merged with the *Liberty Party Paper* and became the *Frederick Douglass' Paper*, which became another influential abolitionist newspaper.

In 1859, Douglass fled to Canada to avoid being arrested for allegedly participating in the raid of the federal arsenal at Harpers Ferry, led by John Brown. When he returned to the United States in the mid-1860s, he started *Douglass' Monthly* magazine with abolitionist information. It primarily was for British readers and it lasted 3 years.

Douglass didn't give up on journalism, however. In 1870, Douglass became one of the editors for a new weekly, the *New Era* in Washington, DC. Later, he bought half interest in the paper and changed the name to *New National Era*. In 1874, the paper failed and he then would support the *New Citizen*, which was owned by his two sons, Frederick Jr. and Lewis. Before his death in 1895, Douglass had served as vice president of the American League of Colored Workers, worked as a lecturer for the Anti-Slavery Society, and in 1889 was appointed as the U.S. minister to Haiti.

Wells-Barnett was born in 1862 in Mississippi. About 6 months after her birth, the Emancipation Proclamation was the law of the land and infant Wells-Barnett and her parents were set free. Her parents would die of yellow fever about 15 years later. For college, she went to Fisk University in Nashville, Tennessee, where she wrote for the student newspaper. After college, she moved to Memphis to teach in a segregated school. While teaching, she also wrote for the *Living Way*, often using the name "Iola" for her byline.

Like Douglass, Wells-Barnett reported, wrote, and published what today would be called advocacy journalism. Her writings advocated anti-lynching laws and racial justice. Between 1890 and 1892, much of her work was published in the *Memphis Free Speech & Headlight*, which she was part owner. In 1892, however, her paper was destroyed after she wrote a story about the lynching of her friend Thomas Moss and two other Black business partners who owned a grocery store in the Black neighborhood that allegedly took business away from a white-owned grocer. She fled to New York and later to Chicago because she had been told that she would be killed if she returned to Memphis.

Everywhere Wells-Barnett moved, she found an outlet to write articles, especially against lynching, in a variety of publications. While in New York, she became a salaried weekly writer for the *New York Age* and continued to give presentations against lynching. She even wrote an in-depth article about lynching in the *Age*, which was published by a former slave, T. Thomas Fortune. In Chicago, she wrote for the *Inter-Ocean*, and in 1895, she married Ferdinand Lee Barnett, who was part owner and editor of the first Black weekly in Illinois, *The Conservator*.

Like Douglass, Wells-Barnett used her writing, reporting, and communication skills for other organizations that supported African Americans in the areas of integration, equal salaries for teachers, anti-lynching, and equal rights and justice for all. She also was involved with the formation of the National Association for the Advancement of Colored People with W. E. B. DuBois and Mary Church Terrell. She was a leader in the Illinois suffrage effort and cofounded the National Association of Colored Women. Wells-Barnett published

her autobiography, *Crusade for Justice*, before dying of kidney disease in 1931.

Decades later, Douglass and Wells-Barnett, former slaves and journalists, had another thing in common. They both had a U.S. postage stamp issued in their honor during Black History Month. The stamp honoring Douglass was first issued on February 14, 1967, while that for Wells-Barnett was first issued on February 1, 1990. A second postage stamp was issued in honor of Douglass on June 29, 1995, as part of the commemoration of the 130th anniversary of the end of the Civil War.

From Civil Rights to Black Lives Matter

Owners and supporters of the New York *Amsterdam News*, with the help of the Harlem Businessmen's Club, campaigned to better the African American economic status in the United States. The paper debuted on December 4, 1909 and later, had a slogan that said, "Don't Buy Where You Can't Work." It evolved from the Harlem Businessmen's Club's slogan of "Spend Your Money Where You Can Work."

Reporting issues of economics and civil rights for African Americans helped keep some newspapers alive. Founded in 1905, the *Chicago Defender* increased its visibility as the civil rights movement gained momentum in the 1950s and was emboldened to have a stronger voice in the African American community. In 1956, it became *The Chicago Daily Defender*, the largest African American-owned daily in the United States. It would publish daily for about 52 years before returning to being a weekly newspaper. In 2019, the publisher of the historic paper, Real Times Media, announced that the *Chicago Defender* would stop publishing its print edition and only publish online.

During the urban riots in the 1960s, the African American press lost many talented journalists to the white newspapers and television news stations that needed African Americans to cover the riots and where journalists could earn more than they did in the Black press. In 1968, a report from the National Advisory Commission on Civil Disorders (known informally as the Kerner Commission) partially blamed the white press for the riots because of unfair and unbalanced reporting on race matters. Studies have shown that African

Americans continue to be more likely to be portrayed as defendants and perpetrators in the mainstream news media, while whites are shown as victims. For instance, after Hurricane Katrina, a photo of a young Black man wading through the water while holding a plastic bag and a case of soda carried a caption describing this as "looting." A similar photo of a white couple holding bags of food were described as "finding" the food.

Meanwhile, the civil rights movement did not get the attention of U.S. presidents and other federal officials as long as the African American news media were the major source of news reports. Its predominantly African American audience wasn't powerful enough to attract the attention of the powers that be in Washington, DC. But once the mainstream white papers and news stations began to carry news reports with photographs and video of police dogs attacking nonviolent protesters, police officers swinging clubs at African American women and children, and fire hoses being opened on unarmed protesters, the nation's leaders took notice. When physical attacks on white citizens and killings of young white males and females who were protesting beside the young and old in the African American community was broadcast on the evening network news stations, it got the world's attention.

More recently, as the deaths of unarmed young Black men at the hands of police gained more scrutiny in the national press, they were taking notice of a story that had long been told by the African American news media. In July 2013, George Zimmerman was found not guilty of murdering Trayvon Martin the previous year in Sanford, Florida, and #BlackLivesMatter was born. On August 9, 2014, Michael Brown was gunned down in the streets of Ferguson, Missouri, by a police officer. He wasn't armed. A national conversation surfaced about police brutality of unarmed Black men and institutional racism. Statistics showed that African American males were more likely to die from police violence than white males. In recent years, many other cases have been reported in both the African American news media and mainstream news media, including Eric Garner on Staten Island on July 17, 2014; Tamir Rice in Cleveland, Ohio on November 22, 2014; Freddie Gray in Baltimore, Maryland on April 12, 2015; Alton Sterling in Baton Rouge, Louisiana

on July 5, 2016; Philando Castile in Falcon Heights, Minnesota, on July 6, 2016; Anthony J. Weber in Westmont, California, on February 4, 2018, and George Floyd in Minneapolis, Minnesota on May 25, 2020.

Associations and News Services

John H. Sengstacke, the nephew of the Chicago Defender founder, formed what originally was called the National Negro Publishers Association. Years later, the name was changed to the National Newspaper Publishers Association (NNPA), but the organization continues to support Black community publications. It also runs the Black Press USA website, which features news from African American journalists and Black community publications. Black Press USA features news from an African American perspective on U.S. and world events, crime, politics, law, economy, business, technology, education, and lifestyle (sports, religion, entertainment, fashion, and health). Contributing to the collection of information, news and editorials are nearly 200 African American-owned community newspapers from around the United States.

NNPA's Credo of the Black Press promotes strengthening Black publications' efforts and impact. It begins:

The Black Press believes that America can best lead the world away from racial and national antagonism when it accords to every person, regardless of race, color or creed, full human and legal rights. Hating no person, the Black Press strives to help every person in the firm belief that all are hurt as long as anyone is held back. (NNPA, About, n.d.)

In earlier years, there were other news services for the Black press. As early as 1884, the National Colored Associated Press was organized and was able to distribute news, usually via Western Union, to newspapers around the country. More than 40 news services followed, though often short-lived, including Atlantic News Service (Columbia, South Carolina), 1936–1940; Great Eastern News Syndicate (New York City) 1938–1943; Negro News Service (Minneapolis) (1938–1942); Victory News Service (Milwaukee) 1942–1943 and the United Negro Press (Detroit) 1938–1939.

On December 12, 1975, a group of 44 African American print and broadcast journalists from across the United States gathered in Washington, DC. The National Association of Black Journalists (NABJ) was formed. The purpose was to establish a professional journalism organization that could offer a network committed to creating a diverse and inclusive journalism industry. During its annual conventions and regional conferences, the emphasis has been professional development workshops with networking opportunities, job and internship fairs, resume and portfolio critiques, and updating industry trends, technology, and resources, for young and veteran journalists. Even though over the years the majority of the more than 2,500 NABJ members have worked predominately in the mainstream media, there remains a continued liaison with the Black press via NABJ membership, including employment and internship opportunities. Countless members have gotten their start at Black newspapers, radio stations, and cable television stations.

Contemporary African American News Media

At one time, the radio waves were the best way to reach the African American community with news, music, religious programming, sports, and entertainment. One major company targeting the African American community and reaching about 25 million listeners each week has been the American Urban Radio Networks. The network was created in October 1991 after the merger of a New York company (National Black Network, which was founded in 1973) and a Pittsburgh company (Sheridan Broadcasting Network).

According to the *Editor & Publisher News Media DataBook* for 2019, there were a total of 153 Black newspapers in the United States. A few states had more than a half dozen Black newspapers, including Texas with 20, California with 16, and Florida and Georgia, which each had 11. The District of Columbia had four.

On Jan. 25, 1980, Black Entertainment Television (BET), founded by Robert L. Johnson, first aired its cable programming. Based in Washington, DC, the target audience primarily was African Americans. After that first year, BET expanded from 2 hours of programming a week to 24 hours

of news shows and entertainment, including music videos and reruns of Black comedies. It soon added talk shows, sports features, and political commentary. Ed Gordon anchored BET's first half hour news program and Tavis Smiley hosted a political show, *BET Talk*. Later the network added *BET Nightly News*. One major program that has been a highly rated show on BET since 2001 is the annual *BET Awards* show, celebrating African American achievements in sports, acting, and entertainment. The Viacom-owned cable network boasts that it is seen in 90 million homes.

In a recent American Press Institute survey conducted by the Media Insight Project, the way African Americans consume news was studied. Survey results show that trust and accuracy were important to them, but which media outlet was ranked the highest depended on how people thought the community was covered. Survey results show that 23% said the African American communities were covered very regularly, while 71% said they were covered somewhat regularly or only occasionally and 3% said they were basically never covered. As a result, African Americans surveyed said that of the sources they use, their communities were covered most regularly by local television news stations, second by African American-specific news organizations, third by newspapers, fourth by radio programming, and last by the 24-hour news stations.

AGENCE FRANCE-PRESSE

Agence France-Presse (AFP), the successor to the French news agency established by Charles Havas in 1835, is widely considered to be one of the most prestigious of the global news agencies created during the 19th century. Their purpose then, as now, was to gather news from around the world and sell or distribute it for printing,

broadcasting, or other dissemination in newspapers, radio, television, and other media, as well as non-media clients in the financial, economic, and political realms. AFP is generally ranked third after Thomson Reuters (headquartered in Toronto, Canada) and Associated Press (AP, headquartered in New York).

In 2018, AFP claimed an extensive range and number of bureaus, with operations in 151 countries. Although the statistics may not be precisely comparable to those for other news agencies in recent years, this appears to be more than recent statistics indicate for AP, which operated in 101 countries, and China's Xinhua News Agency, which operated 170 offices worldwide, but fewer than Reuters, which maintained 200 locations worldwide. AFP has traditionally lagged well behind Reuters and AP in annual revenues.

The three major news agencies of the world were originally based in London, New York, and Paris, metropolitan hubs of the three major Western powers of the 19th and 20th centuries. As a result, the approach to providing news, images, and other information at all three have been influenced by the presumptions and preoccupations of these powers, regardless of how well this serves clients elsewhere in the world. In the case of AFP, the decision of its founders to establish the agency as both a domestic and, despite the challenges, an international agency, reflected a desire to retain the place of France and in particular Paris as a leading global center of imperial prestige, journalism, and culture. This entry first discusses the origins of AFP, then looks at the news agency's governance, its dependence on the state, and its efforts to diversify its services.

Origins

AFP may be regarded as the natural successor to the Havas news agency, possibly the world's first international news agency and certainly first among those that are best known or remembered today. At the time of its founding, Havas was both a news organization and an advertising agency, supplying news to newspapers from which it also brokered newsprint space for advertisers to sell their goods and services. It worked closely with the government, from which it received subsidies for its international correspondent network.

Havas was nationalized by the collaborationist Vichy government that administered non-occupied France and the French colonial territories during World War II. Its news service became the basis for the Office Français d'Information (French Information Office, OFI), which in 1942 took over an official collaborationist agency in Paris, the Agence française d'information de presse (French Press Information Agency, AFIP) that was run mainly by German Nazi officers and journalists.

From 1942 OFI was a tool of the German news agencies DNB and Transocean. Havas continued as a travel and media business, emerging later as one of the world's largest advertising and public relations agencies. The London wartime bureau of the Havas news agency became the hub of a Resistance agency, Agence Français Indépendante (Independent French Agency, AFI), established by Paul-Louis Bret, working with support from British official information services and in cooperation with Reuters. AFI was opposed to the German occupation of France but also sought to be independent of Charles de Gaulle, leader of the Free French Forces, and later chair of the Provisional Government of the French Republic from 1944 to 1946, and president of France from 1959 to 1969.

Bret prepared AFI for eventual conversion into the post-war national news agency of France. Although he had labored from London in an official capacity for the Vichy regime's OFI early in the war, he worked with the British Ministry of Information to maintain services to former Havas clients in South America and in the Near and Far East. Bret also set up an independent agency in North Africa, based in Algiers under the name of France-Afrique, and worked toward the merger of France-Afrique with AFI in London. Personnel from these and other agencies (not OFI), including the resistance agency Agence d'Information et de Documentation (AID) helped establish Agence Française de Presse in August 1944. The new agency was quickly renamed Agence France-Presse. Bret was appointed AFP's second director-general in 1947.

Although AFP was dependent on government funds initially, Bret's vision was that it be an independent agency. Bret contributed to the ideas that underwrote the 1957 statute for AFP that formalized its independence. This was not just a question

of independence from government (although financial independence from the State has never been fully achieved) but also independence from the sale of advertising space that had characterized pre-war Havas and to which socialist Prime Minister Leon Blum was opposed in the late 1930s. Following World War II, Blum again denounced the idea of a link between news and advertising operations.

Governance, State Dependence, and Diversification

AFP's mission statement commits it to the uninterrupted supply of accurate, impartial, and reliable information. In 2018, AFP maintained contractual relationships with 90 national news agencies worldwide, mostly commercial though sometimes based on exchange of services. AFP had bureaus in 151 countries and provided news in six languages (French, English, German, Arabic, Spanish, and Portuguese). The agency regards the addition of new languages for automatic translation of certain categories of news as a strategy for market expansion at a time of crisis for legacy media. In 2018, AFP had approximately 3,000 media clients worldwide and employed 1,500 journalists (over half of a total staff of over 2,200).

As established by a 1957 statute, amended in 2015, AFP is a species of state-supported public company controlled by an administrative council of 19 members, including the director general. The board has seats for five external experts. Additionally, the French newspaper press shares five seats, public audiovisual services have two, the State has three, and AFP staff have three. The reformulated statute regularizes the agency's relationship with the State through a formal contract that involves a dependable and renewable State subvention for both "missions of general interest" and payment for news services. It also establishes an institutional means—AFP Blue—for the raising of new funding and commercial projects.

Since its inception the agency has sustained news coverage from and to most countries and territories of the world, with notable successes in Asia. From the time of its formal establishment under statute in 1957, it has retained a strongly democratic culture involving a tiered system of shared governance whose participants are

newspaper directors, State broadcasters, ministerial representatives, and representatives of the agency's employees.

The cooperative model of news agency governance has declined significantly since the beginning of the 21st century. Examples include the demise of Canadian Press, the New Zealand Press Association, and Sweden's TT as cooperative news agencies. Their decline may be attributed to the travails of their traditional clients. These include concentration of press ownership, shrinking newspaper revenues in an age of digital competition for information and advertising, neoliberal commitment to for-profit models, competition from Internet platforms such as Google and Facebook, and the political and economic challenges of diversification. Yet AFP, like AP and the German news agency dpa, still retains strongly cooperative features. In law, AFP is a publicly owned, autonomous organization with a "civil personality," that operates according to commercial rules.

While AFP's continuing financial dependence on the State is problematic for those of its critics who consider State support anathema to editorial independence, the agency is in good company. Three quarters of all national news agencies are similarly dependent on government revenues, in whole or in part, as are some other significant contenders for the status of global news agency, such as Russia's TASS and China's Xinhua, and some other leading national news agencies that sustain significant international activity such as the government-owned EFE of Spain—which is often described as the world's fourth largest international agency with significant operations in Latin American and Spanish markets.

For many decades and with faltering success AFP has struggled to wean itself from dependence on the State for a substantial proportion of its funding, even if State funding has been justified, at least in part, as State payment for news services rendered. In 2017, AFP depended on the State for 38% of its total revenues of 295 million Euros. The State subsidizes the "services of general interest," the correspondent network outside of France, and strategic innovation projects. Dependence on the State, together with the relative importance of media clients in France and the French territories, has meant that for much of the agency's history

revenue derived principally and substantially from the Francophone world. But with shrinkage of the French media market some 60% of the agency's revenues today derive from outside of France. The State has also been indispensable in providing access to the financial sources necessary for technological advancement, particularly in computerization, digitization, video, and social media.

The agency has persistently sought to diversify its streams of revenue by means of the addition of services in photography, television, video, economic, and other specialized news services. By comparison with some agencies that have developed stronger commercial revenue streams, such as the German agency dpa, AFP was running at a loss in 2017, amidst a self-declared crisis. Further diversification would be a likely response to the increasing challenges that the agency has faced in traditional markets.

New markets, pricing strategies, products, and digital prioritization (including the separation of infrastructure from content and the participation of third-party suppliers) were identified as promising ways forward. Indicative of an intensification of diversification strategies, 40% of AFP's revenue in 2017 derived from visual services, of which 80% came from outside of France. AFPTV had 600 clients and produced almost 3,000 live video stories. AFP ran three Twitter accounts: open, private, and, for paying subscribers, professional. Services of production on demand and of public relations were regarded as areas of growth.

AGENDA SETTING

Agenda setting is a concept that explores effects of exposure to news media. The logic behind agenda setting is that the news media do not necessarily tell people *what* to think but instead influence what *people* think *about*—they are an influence on the public's perception of which issues are important. The agenda-setting effect involves social learning—individuals learn the relative importance of a menu of issues based on how much coverage those issues receive in the news media. Since the initial study conducted during the 1968 U.S. presidential election (McCombs & Shaw, 1972), hundreds of research studies have examined this process, making it one of the most thoroughly researched theories in the journalism and mass communication field.

Agenda setting has been a remarkably flexible theoretical approach. Researchers have applied the agenda-setting theoretical framework to studies involving such topics as content analyses of news coverage on a single issue and experiments examining information processing of news content.

The process of agenda setting begins with coverage of a particular issue. For example, a local newspaper could decide to run a series of stories dealing with why we need strict gun control laws. The paper's readers would be exposed to the stories. The stories would not necessarily lead readers to believe that the United States needs strict gun control laws. Rather, the effect of the stories would be to raise the salience of gun control as an issue in readers' minds. The coverage would lead readers to raise gun control on their own agenda of issues with which they are concerned.

Because agenda-setting research concerns the transfer of issue salience from news media to the public, analyses often combine two research methodologies: a content analysis of media coverage and responses to a public opinion survey. Many studies employ a survey item commonly used in

Gallup polls. This “most important problem” question asks respondents: “What is the number one problem facing our country today?” Responses to this open-ended question are then used to form the public agenda.

Agenda-setting research can be grouped into five categories: original tests of the hypothesis, contingent conditions affecting the magnitude of agenda-setting effects, influences on the media agenda, consequences of agenda setting, and second-level agenda setting.

Original Hypothesis

The original hypothesis emerged at a time when media effects research was struggling. Prior research in the 1950s and early 1960s consistently found minimal effects of mass media. Many of these studies, however, were looking for behavioral effects of mass communication—notably, media influence on voting behavior. Early agenda-setting researchers, however, examined a different effect of mass media—a cognitive effect in which individuals learn about the important issues of the day from media coverage. Thus, instead of a powerful (behavioral) effect of media, agenda-setting researchers were proposing a moderate (cognitive) effect.

Agenda-setting researchers have examined this moderate effect using many different methodologies. At the heart of the analyses has been a comparison of two issue agendas: the media agenda or those issues receiving news coverage; and the public agenda, or the list of issues perceived as important by the public. Research centers on how issue salience is transferred from the media to the public.

The original agenda-setting hypothesis proposed an analysis of an “agenda” of issues—or a series of issues. Some researchers, however, have conducted analyses employing a single issue. Single-issue studies are especially effective at examining agenda-setting effects across time—how the rise and fall of media coverage coincides with the parallel rise and fall of public concern about the issue. Issues examined in agenda-setting research have included the economy, the environment, civil rights, and Watergate.

Researchers also have employed different units of analysis. Some studies focus on the issue as the

unit of analysis by aggregating survey respondents—grouping individuals according to the issue that they believe is the most important problem. Other studies examine differences across individuals—which personal characteristics play a role in the agenda-setting process. Finally, agenda-setting effects have been studied in many different countries and cultures. In addition to the United States, these include Taiwan, Germany, Sweden, Australia, South Korea, China, Argentina, and Japan, among others.

Contingent Conditions

From the onset, researchers have sought to discover variables that either enhance or inhibit the agenda-setting effect. Even early researchers acknowledged that effects were not uniform across all individuals. Wayne Wanta (1997), for example, tested a model of agenda setting in which attitudes toward news media led to reliance on media for information about issues. This reliance led to exposure to the media, which in turn led to agenda-setting effects. Also influencing the agenda-setting process were interpersonal communication and political attitudes. If individuals talked often with others about issues that received a great deal of coverage in the news (e.g., the economy), this provided a second exposure to information about the issues and thus increased the agenda-setting impact. On the other hand, if individuals talked often with others about issues not in the news media, issues that received little media coverage (e.g., AIDS), this provided an issue agenda that conflicted with the media agenda and thus lessened the agenda-setting effect. In addition, people highly interested in politics were more likely to attend to media messages, and they therefore become influenced by them.

David Weaver (1997) suggested a similar process is at work. His “need for orientation” concept predicted that if individuals had high uncertainty about issues and were highly interested in issues (issues had high relevance to them), they would be highly motivated to use the news media and thus demonstrate strong agenda-setting influences. Uncertainty and relevance therefore played key roles in the agenda-setting process through the need for orientation.

Educational level appears to be especially important. Studies have consistently found the strongest agenda-setting effects among highly educated survey respondents.

Influences on the Media Agenda

Several agenda-setting researchers have examined how the media agenda is constructed through newsgathering routines. As these routines make abundant use of sources, important sources, such as the U.S. president, can affect the news media's issue agenda. One such study examined a series of presidential State of the Union addresses and whether the news media influenced issues mentioned in the presidential speeches, or if the speeches influenced subsequent media coverage (Wanta, Stephenson, Turk, & McCombs, 1989). The findings were mixed. The issues emphasized in President Richard Nixon's speech influenced subsequent media coverage in 1970. President Jimmy Carter, on the other hand, was influenced *by* media coverage leading up to his speech in 1978. In other words, President Carter was reacting to the media agenda. President Ronald Reagan appeared to have influenced newspaper coverage, but in turn, he was influenced by television news coverage. Thus, Reagan was reacting to newscast coverage, but print media were following Reagan's issue priorities.

The relationship among the president, press, and public has often been termed *agenda building*. Gladys Engel Lang and Kurt Lang (1983), in their examination of President Nixon and the Watergate scandal, argued that the president, press, and public are highly connected. A president may discuss an issue, which will in turn receive media coverage that leads to public concern. That concern may lead to additional reactions from sources, which will lead to additional media coverage. This process will continue until one of the three actors tires of an issue.

Other researchers have examined coverage of city council issues and how U.S. automakers' executives influenced news coverage of international trade. Public relations practitioners also have been shown to impact media coverage. Broadly, most studies demonstrate strong influences of sources on the media agenda.

In addition, some research has examined intermedia agenda setting—how elite media set the agenda of other news organizations. *The New York Times* and Associated Press news service, for example, often impact coverage patterns of other media. Intermedia agenda setting has been examined through the Internet as well. Journalists routinely monitor Internet news sites and blogs for news story ideas. In turn, these websites and blogs monitor traditional media for their topics. The relationship between the traditional media and Internet, then, appears to be reciprocal if not circular.

Consequences of Agenda Setting

While research into the sources of the media agenda examine how the news is constructed—analyses of a process leading up to the press–public interface—research dealing with consequences of agenda setting investigates what happens later in the process, after the media agenda affects the public. There are two main sub-streams in this area.

First, some studies have examined behavioral effects that follow the typical agenda-setting influences. Does media coverage ultimately motivate the public into action? In other words, research seeks out potential behavioral effects, such as voting behavior, which was largely abandoned after much early research (prior to the 1960s) showed minimal effects of mass communication. Other behavioral variables examined in agenda-setting research include writing letters to the editor, posting messages on electronic bulletin boards, and purchasing of products—all of which have been linked to media coverage.

Other studies have examined whether public officials act on issues or concerns brought to the fore by agenda setting. Such “policy agenda-setting” studies examine how policymakers take cues from both media coverage and public opinion to propose laws aimed at relieving a societal problem. Thus far, such research has been scant, possibly because many issues receive inconsistent coverage over time. Thus, many policy studies are more anecdotal than empirical. They have examined media coverage and subsequent policy actions for issues such as child abuse and governmental corruption. Another reason for the limited research

in this area is that public officials, the news media, and the public tend to interact with each other in the agenda-building process—creating a circular relationship that is difficult to track.

Studies of the consequences of agenda setting demonstrate the importance of the news media. Not only do the issues covered in the news raise the perceived importance of the issues among the public, but also they often mobilize both the public and public officials to take action.

Second-Level Agenda Setting

The newest agenda-setting research involves the study of a “second level.” Instead of an agenda of issues, second-level agenda-setting research investigates an agenda of attributes—the characteristics of people, places, and things in the news.

Second-level agenda-setting research is closely related to framing. Framing describes the process in which the media “frame” issues in the news by concentrating on certain elements but ignoring others. It is impossible to cover every aspect of every news story, so reporters must choose what to include and eliminate. Neither can the news media include every characteristic of objects in the news. Again, reporters must choose among attributes of objects. The public learns the significance of these attributes based on how often they appear in the news. Thus, the media through their coverage again set the public agenda, in this case, an agenda of attributes.

Researchers have commonly examined two dimensions of second-level agenda-setting research: substantive and affective attributes. Substantive attributes involve information about qualities of newsmakers, such as a presidential candidate’s experience with foreign affairs. Affective attributes involve positive, neutral, and negative qualities. In other words, the substantive attributes deal with facts and affective attributes deal with evaluations of newsmakers.

Maxwell McCombs, Esteban Lopez-Escobar, and Juan Pablo Llamas (2000) found support for media influence on both of these dimensions in their study during the Spanish national election of 1996. First, they found that public perceptions of substantive attributes were closely related to media coverage of those attributes. Likewise, they found that public perceptions of affective

attributes were highly correlated with media coverage. Thus, the public linked both information about candidate characteristics and positive/negative evaluations of candidates to media coverage.

Second-level agenda setting has largely concerned people in the news as the object of the analysis, including analyses of the president or candidates in elections. Recent studies have investigated media coverage and public perceptions of other objects, such as countries and large corporations. Issues also can be examined as an object, with sub-issues acting as attributes. The economy, for example, could be an object, with inflation, unemployment, the budget deficit, gasoline prices, and so on, as substantive attributes.

Conclusion

Agenda setting has been an important theory in mass communication research for a third of a century. It has retained its importance even with the emergence of the Internet as a source of information that differs greatly from traditional news media. And it has evolved to include a second level of study—an agenda of attributes. Indeed, research can focus on many possible agendas and many possible objects. Agenda setting highlights a process of media effects that underlines the importance of the news business. Issues covered in news stories become those that the public believes are important.

AGRICULTURAL JOURNALISM

Some 2 million farms cover 900 million acres throughout the United States, and for many these farms are what come to mind when the word agriculture is used. However, the U.S. agricultural sector extends beyond farm production to include such industries as fishing, forestry, and food production. Agricultural journalism refers to a specialized media system and network of communication professionals that provides news, information, and commercial messages to the agricultural industry and other audiences. Gaining a deeper awareness of the origin and current status of agricultural journalism not only provides perspective on a crucial and diverse industry but also offers a rich historical context in which to better understand mainstream American journalism and consider some of its contemporary challenges.

This entry traces agricultural journalism in the United States from its origins through a period of steady growth over the course of the 19th century, when pioneering editors sought to promote sound farming methods and innovative techniques to

increase yield and sustain the fertility of the soil. The sections that follow discuss the opening of the west to settlement by farmers, who received grants of land under the Homestead Act of 1862, and the establishment of land-grant colleges under the Morrill Act of the same year, which subsequently would transform higher education in the United States. At the same time, the diffusion of innovations became one of the primary missions of agricultural journalism, incorporating the findings of social science research into the body of knowledge that fueled the Green Revolution in the 20th century. Next, the entry details the rise of large-scale agribusiness and the consolidation of agricultural journalism by a handful of giant media corporations, leading to the introduction and rapid adoption of the new media that dominate today's communication landscape.

Beginnings

The beginnings of the agricultural journalism profession can be traced to the early 1800s, when agricultural societies and other organizations took advantage of the only medium of the age—print—to share information about farming. Nearly three-fourths of the U.S. population resided on farms in this era and even more resided in rural areas. Making a living from the land was difficult, manual work. The limited knowledge that existed on farming practices was passed down from generation to generation or by word of mouth. It would be another century before American colleges of agriculture were conducting and disseminating research on recommended agricultural practices. Until then, the task of sharing knowledge and ideas to improve farming methods and rural standards of living was largely in the hands of fledgling agricultural editors and printers.

Throughout the 1800s, many agricultural journals were launched although few were successful for any extended period. This was the penny press era in the mainstream press—publications proliferated largely for their affordability and entertainment value, not their editorial content. Still, this was a pivotal era in communication in which the working-class public was developing an affinity for and dependence on mass media that had not previously existed and would never be relinquished.

Early agricultural publications generally did not participate in the sensational reporting tactics associated with 19th-century journalism. But effective communication with farm and rural audiences was seriously hampered by other challenges, including a lack of reputable sources on sound agricultural practices. Research-based information was not available. The geographic isolation of farmers was compounded by the poor state of roads and lack of dependable mail delivery. Getting information into rural homes was no simple task.

Several progressive agricultural editors of the era used their publications, and political influence, to advocate for farm and rural audiences. Among them was Jesse Buel (1778–1839), a wealthy printer who published *The Cultivator*, a popular farm journal of the period. The forward-thinking Buel experimented with and reported on then-new farming techniques such as crop rotation and soil drainage well before agricultural conservation techniques were widely used on farms. He took up agricultural reform later in his career, serving as an advocate for public education and other farm and rural causes. Another imaginative 1800s agricultural editor, Luther Tucker (1802–1873), founded the highly successful *Genesee Farmer* in 1831, a journal that also championed agricultural soil conservation practices. Tucker is known for his idea of hosting an annual cattle show in New York. He envisioned an event that would both entertain and educate participants. His novel concept, which we recognize today as the state fair, was ultimately adopted in every state.

Through their lifelong editorial and political efforts, Buel, Tucker, and other reform-minded editors carved a path for a *profession* of agricultural journalism long before professional training existed for communicators. The brand of journalism they helped invent involved strong advocacy for, and service to, farm and rural residents. In addition to arguing for sound farming practices, they called for unification of farmers, better roads and schools, and improved living conditions for rural residents. Their ideas were innovative, even revolutionary, for their time and ultimately helped transform agricultural journalism from a craft to a professional activity beginning in the latter half of the 19th century.

Growth and Development

Both agricultural and mainstream journalism in the United States grew alongside the country's rapid growth and development during the latter half of the 19th century. During his presidency, Abraham Lincoln signed milestone legislation that would propel higher education in the United States, initiate agricultural research programs, and improve the lives of working-class and rural residents who still comprised more than 80% of the U.S. population. Perhaps the single most important legislation of the period was the Morrill Act, passed by Congress in 1862, which authorized and provided a plan for the sale of public lands and the establishment of land-grant educational institutions in every state. While land-grant schools were not the first higher education institutions in the country, they stood alone in offering instruction in agriculture and other practical fields to broad segments of society, including working-class residents in each state. Instruction for women was limited to certain fields. The original land-grant legislation was expanded in 1890 and 1894 in federal attempts to address unmet needs of African Americans and Native Americans, respectively. While land-grant colleges of agriculture struggled until the turn of the century to gain farmer acceptance, they gradually built enrollments and in time enjoyed unprecedented success in higher education.

Additional 1862 legislation was transformational for U.S. agriculture and settling of the western frontier. The Homestead Act moved farmers and others westward by offering a free parcel of land to those who settled and lived on it. Westward travel by wagon train was difficult and dangerous, but such journeys would become easier following passage of the Pacific Railroad Acts of 1862, which led to the nation's first transcontinental railroad. The establishment of the U.S. Department of Agriculture, also in 1862, would in time lead to the development of government programs to benefit farmers and consumers, protect natural resources, and achieve other agricultural production and environmental goals. Coming along later in the decade was the 1887 Hatch Act, which established experiment stations at land-grant institutions to conduct agricultural and other applied research important in each state.

It is difficult to overstate the impact of land-grant legislation on the United States of the 20th century. The research conducted by land-grant universities, as well as by other educational institutions and private industry, would lead to the rapid development of new technologies and innovation in food and agriculture, industry, transportation, warfare, and medicine. The rapid technological and economic change occurring at the turn of the 20th century was described in some accounts as going to bed in one country and waking up in another. Everyone did not share equally in the industrial and economic boom. Millions of urban and rural people, and particularly immigrants, continued to face a life of poverty and inequality. Stark differences between the rich and the poor were increasingly evident. Historians have called the late 1800s the Gilded Age, in metaphorical reference to a visible but superficial plating of gold (wealth) that only thinly masked persistent social problems and poverty. Agricultural and mainstream journalism documented the hardships and opportunities of the era.

The knowledge base of agriculture grew exponentially in the early 1900s as land-grant universities and experiment stations proved their worth to farmers and industry. Researchers tested an array of new farming techniques in the lab and field, improved methods for raising livestock, and increased mechanization for planting and harvesting crops. University extension services demonstrated new agricultural practices and use of equipment through field days and demonstrations that attracted thousands of farmers. They also hosted short courses and other programs aimed at improved farm record-keeping and management. One of the more innovative educational methods of the time were extension-service trains with specially equipped railroad cars for demonstrating various new farm and home practices. As the trains traveled from stop to stop, extension experts shared the latest university information with farmers, homemakers, and scores of curious onlookers.

Aided by the development of land-grant colleges of agriculture, farm editors and their publications matured as providers of relevant, research-based farm production news. Editorial positions were fast becoming full-time positions requiring specialized communication and business

expertise. Stories increasingly included results of farming experiments and recommendations for local producers. In addition to providing production information, editors tried to address the needs of the entire farm household. General farm magazines and regionally popular state publications carried serialized fiction, humorous columns, games, and children's bedtime stories in addition to the standard news fare. The publications offered a brief escape from the drudgery of farm life at a time when entertainment options were limited for farm and rural audiences.

The advent of radio broadcasting in the United States during the early 1900s brought a new source of news and entertainment to rural communities. Radio was especially suited for geographically dispersed and isolated communities and was adopted rapidly by farm families. The medium offered a unique and unprecedented product: a live voice or performance that could be heard by geographically dispersed listeners at the same time. Most Americans had never heard the live voice of a U.S. president until Calvin Coolidge delivered his State of the Union speech over radio in 1923. Radio also served as a bridging technology that would pave the way for other electronic communication media to come.

The introduction of radio brought an abrupt end to print media's status as the sole form of mass media providing of farm and home information to rural audiences. However, farm magazines and radio assumed complementary roles and, together, served as media workhorses throughout the first half of the 20th century. General and state farm magazines enjoyed widespread name recognition and were highly trusted among specialized audiences. Radio offered immediacy and was especially well-suited for broadcasting weather, markets, and news updates. Various on-air personalities gained near-celebrity status and admiration from local listeners. Radio's audio quality and reach were being constantly improved. Those enhancements, along with other technological developments, set the stage for yet another new medium in the 1950s: television. As with mainstream media, farm television took advantage of well-known radio talent to develop and host various program offerings. Farm television shows typically aired in early morning time slots to match farmers' schedules.

Undisputed Gatekeepers

Twentieth-century agriculture was fast becoming a research-based field requiring highly specialized content knowledge. During this time, university and private industry expertise solved many of the previous century's technical agricultural production problems. Assembling and presenting research-based agricultural news to farmers and industry became the unique province of professional agricultural journalists, now the undisputed information gatekeepers for small and large farm producers.

Professional entry into the agricultural journalism field had always required understanding of the various facets of agricultural production. Knowledge of science was quickly emerging as an additional requisite skill. Those who were lacking in subject matter knowledge often learned on the job. The blossoming field, a forerunner of modern service journalism, needed writers, broadcasters, photographers, graphic artists, and others with professional communication training and skills to work across traditional and emerging media platforms. By the late 1950s, at least seven national organizations had formed in the United States in response to the need for professional development in agricultural journalism:

- Association for Communication Excellence (established in 1913 as the American Association of Agricultural College Editors);
- American Agricultural Editors' Association (established in 1921);
- National Association of Farm Broadcasting (established in 1944 as the National Association of Radio Farm Directors);
- North American Agricultural Journalists (established in 1952 as the Newspaper Farm Editors of America);
- Agricultural Relations Council (established in 1953);
- Cooperative Communicators Association (established in 1954); and
- International Federation of Agricultural Journalists (established in 1956).

Professional organizations such as the American Association of Agricultural College Editors and the National Association of Radio Farm Directors recognized the value of emerging social

science research as a tool to improve communication efforts. With support from the Kellogg Foundation, a National Project in Agricultural Communications was launched to host workshops and distribute research-based information from such fields as psychology and rural sociology to assist agricultural communication practitioners in their information efforts with farm and nonfarm audiences.

By this time, university academic programs were attracting relatively small but viable undergraduate agricultural journalism enrollments at nearly 20 land-grant institutions nationally. Baccalaureate programs were typically administered by schools of agriculture in cooperation with schools or departments of journalism and communication. There are at least 30 such programs today offering undergraduate and graduate training in this specialized communication field.

Conflict and Consolidation

By the mid-20th century, the Green Revolution was under way and American agriculture was enjoying unprecedented productivity. U.S. farms were getting larger, but their numbers had been declining for years. Media competition was increasing for shrinking farm audiences. Advertising was becoming the main source of revenue for most commercial media, including farm publications, radio, and television. For farm publishers, the trend was shifting toward a controlled-circulation revenue model in which qualified subscribers received publications at little or no cost. The growing dominance of advertising as a revenue stream signaled a significant change in the business side of agricultural journalism and also began to raise questions about possible impacts on content. Evidence from the literature suggests most commercial agricultural publications attempted to maintain a firewall between business and editorial decisions, but pressures would continue to grow.

Just as land-grant university research had revolutionized agriculture earlier in the century, social science research was providing new insights on how mass media could be used to diffuse news ideas and transfer technology to the public. A central figure in this movement was Everett Rogers, a communication researcher who in 1962 described how innovations are communicated to members of a society and the social process by which

individuals decide to adopt or not adopt new ideas or products. The body of research, known as the *diffusion of innovations*, was among the most widely cited social science work of its time and was commonly used by land-grant universities and extension services to encourage farmers' adoption of a range of new technologies and techniques.

Agricultural journalists played a crucial information gatekeeping role in the technology-transfer and farm decision-making process. Accordingly, they were included in a wave of criticism beginning in the early 1970s surrounding the unintended social consequences of widespread farm-level adoption of new technologies. Difficult questions were raised about land-grant colleges' possible bias toward large-scale agriculture and the nature of their relationship with agribusiness at the expense of small farmers, migrant workers, consumers, and rural communities. Professional and social tensions still surround these topics.

Difficulties continued in the following years as thousands of U.S. farms would be lost to bankruptcy in the wake of the 1980s farm crisis characterized by flooded markets, low commodity prices, and high debt. The loss of small and mid-size farms took a devastating toll on rural communities, whose economic survival depended on agricultural businesses. Images of shuttered, abandoned rural businesses and homesteads were commonplace in national media. Sharp reductions in agricultural advertising also led to significant turnover and consolidation of agricultural media in the 1980s. Some publications did not survive. Others, including many well-known state farm publications, were purchased by larger media organizations and underwent massive staff layoffs.

Farm radio stations were affected not only by withering advertising revenues but also later by the Telecommunications Act of 1996. This legislation deregulated station ownership rules, allowing large media corporations to purchase smaller stations across the United States. Consolidation of agricultural media ownership followed a trend across all commercial media during the next two decades. Scores of publications, along with radio and television stations, have been purchased by a relatively small number of giant media companies and chains. As with the mainstream press,

concentration of ownership means fewer journalistic voices in the agricultural space. Media experts caution that fewer voices are not in the best interests of audiences or democracy.

Current State

A revolutionary wave of interactive communication technology became accessible to the public in relatively short order beginning in the 1990s. The introduction of the World Wide Web during that decade was quickly followed by social media and smartphone apps in the 2000s. Seemingly overnight, online digital and mobile platforms transformed communication and ignited consumers' media use and reliance in nearly every aspect of work and recreation. These new media have been adopted more rapidly by consumers and businesses than any communication technology in history.

Farm magazines, for decades considered the backbone of agricultural journalism, now offer interactive websites, apps, and various online portals accessible through laptops, tablets, smartphones, and other devices. Virtually all agricultural print and broadcast media have integrated some or all of these platforms into their communication offerings alongside legacy media. Agricultural websites are as likely to be accessed by tablets or smartphones as they are by computers, so ease of use and compatibility across devices is essential. While social media use is growing, particularly among younger farmers, it is generally considered part of a larger media mix that includes traditional and new media.

While digital media literacy and analytics are valued 21st-century skills in agricultural communication, writing and subject matter knowledge will always be important. Serving farm and non-farm audiences as a disinterested provider of accurate, relevant information for sound decision-making remains the central task in agricultural journalism.

AL ARABIYA

Al Arabiya satellite TV station, based in Dubai Media City, was established in March 2003 as Saudi Arabia's response to Al Jazeera, the global news channel based in Qatar. The move was an attempt to regain what used to be Saudi dominance acquired through funding Arab media outside Saudi Arabia. An examination of its programming during the U.S. presidency of Donald Trump (2017–2021) suggests that, with some exceptions, Al Arabiya has come to represent the

point of view of conservative Arab monarchies, rather than the populist vision of Al Jazeera. The lavish spending on the station to acquire the latest technology and to hire professionals make it a worthy competitor to Al Jazeera. However, Al Arabiya has not overtaken the popularity of Al Jazeera except in a small number of countries.

History

The station was established with an investment of 300 million dollars by Middle East News, a Saudi production company that also runs the Middle East Broadcasting Center. The Middle East Broadcasting Center Group, which as of 2021 has 18 TV channels, is the largest media company in the Middle East and North Africa. It was launched in London in 1991 and moved its headquarters to Dubai Media City in 2002. Before the establishment of the Qatari Al Jazeera satellite TV in 1996, Saudi businessmen owned almost all of the major pan-Arab media based outside the Kingdom, ensuring that Saudi Arabia and its rulers were rarely scrutinized by that Arab media. While most Arab rulers prevented attacks on the Saudi royal family through laws that restricted such coverage, Qatar gave free reign to Al Jazeera to criticize Arab rulers and governments—an unprecedented act that seriously threatened the soft power of the Saudi media holdings.

An article by Robert Fisk published in *The Independent* on March 6, 2015, summed up the Saudi fears of the Iranians, the Shia, al-Qaeda, ISIS, the Muslim Brotherhood, and of American betrayal and Israeli plots: Above all, they fear the power of tiny Qatar, which owns Al Jazeera and its unbridled coverage of issues Saudi-funded media never touch. In 2017, Saudi Arabia and its allies, the United Arab Emirates, Bahrain, and Egypt, laid out an ultimatum of 13 demands for ending their severing of all ties with Qatar. Demands Number 3 and 4 decreed that Qatar was to shut down Al Jazeera and its affiliate stations, as well as news outlets that Qatar funds, directly and indirectly, according to June 23, 2017, edition of *The Guardian*.

Qatari rulers ignored those conditions, and Saudi Arabia and its allies eventually lost the fight. The countries that tried to undermine Qatar are now reconciling with it, with the help of Kuwait.

Al Jazeera, despite the détente, takes digs at those who befriended former President Trump's advisor Jared Kushner and normalized relations with Israel. For example, at the end of a segment on Arab affairs, on June 6, 2021, the program ran a 1-second critical cartoon, which one would not see if one blinked.

History

From the start, Al Arabiya billed itself as the less provocative alternative to Al Jazeera. The choice of Salah Kallab, a former Jordanian information minister as the first Al Arabiya director-general ensured that the station would avoid what Kallab dubbed as "sensationalism," refraining from challenging Arab regimes or making problems for them, according to Ian Urbina in "The Other Air War Over Iraq" in *Asia Times* on March 1, 2003.

Al Arabiya was established in time to cover the Iraq War. Andrew Hammond, Senior Correspondent for Reuters news agency in Saudi Arabia noted in an October 2007 article titled "Saudi Arabia's Media Empire: Keeping the Masses at Home" that Al Arabiya's agenda took some months to unfold after the Iraq War when it ran documentaries about mass graves and other human rights abuses in preinvasion Iraq. Some saw these documentaries as an attempt to reveal facts about tyranny under Iraqi president Saddam Hussein; others saw them as an attempt to undermine the Iraqi insurgency, popular with the Arab masses.

Islamist websites began to refer to Al Arabiya dismissively as Al 'Ibriya or "the Hebrew Channel" because it granted considerable space to American officials and their allies in Iraq and elsewhere to explain their policies after they invaded Iraq in 2003. Like Al Jazeera, Al Arabiya broadcast montages of Israeli soldiers putting down the Palestinian *Intifada* (uprising), but it also discredited the activities of the Islamist insurgency movement in Saudi Arabia.

Expansion

Al Arabiya Internet News Service was launched in 2004 in Arabic, in 2007 in English, and in 2008 in Farsi and Urdu. The move to add broadcasting in Farsi and Urdu illustrates a move away from

reaching out only to the West toward attempting to influence people who live and work in the region and, thus, may be subject to what Saudi Arabia perceives as Iranian influence that threatens its regional and media dominance. Broadcasting in Urdu is provided to reach the large Urdu-speaking population working in the Gulf region. Al Arabiya Internet News publishes columns culled mostly from other Saudi publications or written by journalists who support the Saudi policies on Lebanon, Syria, Iran, Iraq, Yemen, and the Palestinian territories. More than 200 articles are published on its website daily in four languages. The website attracts roughly 70 million visitors per month.

In March 2012, Al Arabiya launched a new channel, Al Hadath (The Event), which described itself as an extension of Al Arabiya, and with which it occasionally shares content as well as news bulletins.

Censorship and Attacks on Al Arabiya and Its Staff

When Al Arabiya was in its infancy, Brian Whitaker, Middle East editor of *The Guardian*, predicted Al Arabiya's journalists could feel constrained about reporting fearlessly on succession, internal reform, and the rise of separatist currents in the kingdom (Feuilherade, 2003). Journalists are also constrained from reporting internal affairs of the Emirates. Reporters Without Borders noted on October 29, 2009, and updated on July 21, 2016, that American journalist, Courtney C. Radsch, lost her job at Al Arabiya news website for posting information about safety violations on Emirates Airlines.

Because Al Arabiya competes with Al Jazeera for the same audiences, it initially tried to scoop its rival, which exposed it to censorship and physical attacks. In August 2003, Al Arabiya broadcast a clip of masked men threatening to kill members of the U.S.-appointed Iraqi Governing Council, leading a spokesperson for the U.S. State Department to call the station's action irresponsible. In September 2003, the Governing Council of Iraq restricted the operations of Al Arabiya and Al Jazeera for 2 weeks after the channels showed more footage of masked men calling for attacks against U.S.-led forces. On November 16, 2003,

Al Arabiya broadcast audiotapes by the then-fugitive Saddam Hussein exhorting Iraqis against the United States, leading Iraq's interim government on November 24 to ban it from reporting from Iraq for 2 months.

Al Arabiya's reporters have been the target of several attacks in Iraq. On September 13, 2003, Mazen al-Tumeizi was killed on camera when a U.S. helicopter fired on a crowd swarming a crippled American armored vehicle. An unknown Islamist group calling itself Saraya Al-Chouhada Al Jihadiya fil Iraq (Jihadist Martyrs Brigade in Iraq) in a statement published on the Internet on October 31, 2007, claimed responsibility for attacking the station, accusing it of praising Iraqi Prime Minister Ayad Allawi's government and the Americans it described as liberators of Iraq. The group also chided the station for ignoring resistance operations, although the statement's authenticity has not been confirmed, according to a November 3, 2004, report by Reporters Without Borders. In February 2006, three Al Arabiya reporters were abducted and murdered while covering the aftermath of the bombing of a mosque in Samarra, Iraq, among them, a female Iraqi correspondent, Atwar Bahjat.

By its own account, since its launch, 11 Al Arabiya staff members have been killed, including five in a suicide car bombing of the channel's bureau in Baghdad in October 2006, and two by American occupation forces. Jawad Kazem, who escaped from an abduction attempt lost the use of both legs.

Iran indefinitely shut down Al Arabiya's Tehran office on June 21, 2009, accusing it of biased reporting. In contrast, as of June 2021, Al Jazeera reports directly from Iran, including daily accounts on the recent Iranian elections of June 18, 2021. Its news bulletins, for example, included academic experts on Iran who explained the process in great detail.

On October 26, 2019, Reuters reported that Iraq had suspended Al Hadath and Al Arabiya amid anti-government protests in which scores were killed.

Political Orientation of Al Arabiya

In 2004, Al Arabiya was placed under the management of Abdel Rahman Al Rashed, a Saudi

who wrote opinion pieces against Islamists in the Saudi London pan-Arab newspaper *Al-Sharq Al-Awsat*. Al-Rashed moved Al Arabiya away from the graphic images of the aftermath of bombings and the bloody casualty scenes of the wars on Iraq and Afghanistan that the U.S. military found objectionable toward a more sanitized version similar to what the American media were offering their viewers in the United States.

Under Al Rashed, Al Arabiya also took a turn to the right by discouraging the use of Leftist-leaning British papers in Al Arabiya's international press roundup. Anchors and correspondents were instructed to refer to American troops in Iraq as "multinational forces," not "occupying forces," and hosts were asked to prevent guests from digressing into anti-American rants (Shapiro, 2005). However, the instructions did not result in the total elimination of that terminology due to staff and guest resistance.

Al Rashed saw an opportunity for change through media use when Saudi Arabia announced in 2016 its Vision 2030 to reduce dependence on oil and to restructure education and the economy. Al Arabiya, along with other media holdings, have been recruited into an ambitious plan to loosen the hold of the conservative religious institutions on Saudi society. Al Rashed describes the mission as modernizing religious practice by turning it into a more tolerant "Al-Islam al-Wasati" (centrist Islam). He added that Islamic culture in Saudi Arabia had been more tolerant in the 1950s, 1960s, and 1970s before political Islam moved in. In the old days, women rode camels and horses, in contrast to the modern era in which, until June 2018, they were not allowed to drive.

Al Rashed exaggerated the liberalism of that era. Saudi Arabia was the last country among the Gulf nations to introduce secular education. The first school for girls was established in 1956. In September 1963, the Saudi government sent official forces to break up demonstrations in Buraydah, whose citizens were protesting the plan to educate women.

However, Al Rashed hoped that by adopting Islamic centrism as a narrative, Saudi Arabia could serve as the leader of the Muslim world. He added that Sunni Muslim countries with larger populations than Saudi Arabia, such as Egypt, Turkey, Pakistan, and Indonesia, are not in a

position to lead. He saw the adoption of Islamic Centrism, especially at a time when radical Islamist parties were on the rise, as enhancing Saudi Arabia's soft power, which it hopes to export to the world.

After 10 years as general manager at Al Arabiya, Al Rashed left that position in 2014. He then headed an editorial board at the station to guide policy and to streamline the business across multiple platforms and touchpoints.

To avoid losing its Palestinian audience, Al Arabiya has two nonpolitical programs geared to it. The first, Al Arabiya in the Galilee, deals with the beauty of the region where Palestinian Arabs live and explores the historical significance of some of its sites. The second, Palestine: The Beautiful Face, shows what various Arab cities of the occupied West Bank and those located beyond the Green Line that separates the West Bank from Israel have to offer.

Although Al Arabiya's owners and managers are more accepting of American foreign policy, that does not mean that pro-American opinions are always demanded, or can be. To gain credibility, Al Arabiya has had to employ respected veteran Arab journalists, such as Hisham Melhem, who demand freedom from censorship as a condition of employment. Melhem is the correspondent for Annahar, the leading Lebanese daily and also an analyst for Al Arabiya News Channel in Washington, DC. Melhem hosted *Across the Ocean*, for Al Arabiya, a weekly current affairs program on U.S.-Arab relations. In a February 2020 column, titled "Donald Trump's Train Wreck," he accused President Trump of trampling upon the principle of the separation of powers and of disrespecting the judiciary.

President George W. Bush was interviewed by the station twice, once to explain that abuse of prisoners at Abu Ghraib prison in Iraq was an aberrant incident, not U.S. policy. President Barack Obama chose Al Arabiya to talk to the Arab world, at the invitation of Melhem, a move criticized by progressives who saw his shunning of Al Jazeera as bowing to the U.S. military who castigated the most watched Arab channel for showing the carnage of the invasion of Iraq, which American viewers did not see on American TV.

Similarly, although Al Arabiya, unlike Al Jazeera, avoids showing clashes between Israelis

and Palestinians or the funerals of Palestinians killed by Israeli soldiers, some of the footage found its way as background visuals to a song by a Palestinian woman in Al Arabiya's *The Ear Worshipers*, a program that presents noncommercial songs from all over the Arab world.

Al Arabiya regularly publishes and broadcasts anti-Iranian articles and programs. Inside Iran, for example, is a series of investigative reports on the politics, economics, and social life of Iran. When the U.S. government assassinated the leader of Al Quds Force, Qassem Soleimani, a headline read, "Iran Will Bury Its Pride in Soleimani's Grave." Al Arabiya's opinion on the assassination was in direct contrast to the way Al Manar TV covered it. In an article titled "Who Is Crying for Soleimani and Al Muhandes?" reprinted on January 6, 2020, from Asharq Al-Awsat (The Middle East), a Saudi pan-Arab daily published in London, the author stated that the assassination should have happened sooner. The author castigated those who shed tears for Soleimani's assassination at the hands of the United States, including Palestinian factions that mourned Soleimani's death, such as Hamas, Islamic Jihad, and the Leftist Popular front for the Liberation of Palestine. The article also criticized Michael Moore, President Obama, and Hillary Clinton because of their Iran policies.

Al Arabiya has also ridiculed Iran and its supporters. It claimed in a February 5, 2020, headline that an Iranian minister's space suit had been exposed as a \$20 Halloween costume on Twitter. It noted on February 9, 2020, that hundreds of Iraqis took to social media to ridicule the call of a prominent Shia political leader, Muqtada al-Sadr, for gender segregation during protests. One Twitter user who drew a mustache on her face shared a video mocking al-Sadr's comments.

Al Arabiya is no friend of Hezbollah or the regime of Bashar al-Assad of Syria. Al Arabiya published disparaging accounts on the Syrian ruler and his wife, Asma, hiring a public relations firm to burnish the image of Syria after its crack-down on protesters, according to a HuffPost report on July 25, 2012. One headline noted that an Al Arabiya documentary had revealed Hezbollah's drug trade and money laundering links in 2020.

Programming

Al Arabiya programs are described in Arabic and in English. The station airs a news bulletin every hour around the clock. Al Arabiya has two all-news TV channels and nearly 30 offices around the world. It also has two press review programs: *The Fourth Estate* and *Last Edition*. *The Fourth Estate* reviews the opinions of the international print media on Middle East news and hosts international journalists who comment on current issues. The *Last Edition* reviews regional and Arab print media and interviews Arab journalists about their perspectives on regional and world events. It also has a program called *DNA, Daily News Analysis*.

Although Al Arabiya has a strong news presence, it also has more light “infotainment” items than Al Jazeera. For example, one item dealt with a man who divorced his new wife because she posted a photo that was trolled online, embarrassing him. Al Arabiya has printed photos of Hollywood actresses attending award ceremonies and parties wearing dresses designed by Arab-American designers. Al Jazeera has a program called *The Large Screen* that reports Hollywood gossip.

Saad Almatrafi, who joined the news channel in 2003, founded the channel’s online portal AlArabiya.net. He later became the first Saudi news producer and helped set up Al Arabiya’s first news bulletin to be solely dedicated to Saudi affairs. *From Iraq* interviews influential figures to gain insights into the daily problems and concerns of Iraqis, as well as on how they see their future. *Retracing Arab Footsteps* (Ala Khota al-Arab) narrates the biographies of the most prominent Arab figures in history and highlights the incidents and stories that happened during their era. *Ida’at* (Spotlight) hosts prominent guests from the Gulf region. *Political Memoirs* hosts prominent former politicians from across the Arab World. *Special Interview* features prominent figures discussing current affairs. Guests have included Wendy Sherman, the former U.S. Under Secretary of State for Political Affairs, and Palestinian President Mahmoud Abbas. *Rawafid* (Tributaries) delves into the lives of artists and poets, directors, and historians. *Poll on Air* seeks to gauge the feelings of the Arab Street (i.e., of

ordinary citizens, as opposed to politicians) through phone calls, emails and internet voting, and displays the results on a ticker on the screen. *Mahattat* (Stations) covers three segments of new or weird aspects of life. *Point of Order* hosts “controversial characters” (e.g., Syrian President Bashar al-Assad and French philosopher Bernard-Henri Lévy). *Under the Spotlight* hosts three or four guests from different countries with varying opinions to shed light on a hot topic. Al Arabiya’s weekly show *Death Making* provides insights and analysis into the religious, social, economic, and political dimensions of terrorist attacks across the globe. In *Terror in KSA*, Al Arabiya explores how the country has fought terrorism and extremism over the years.

The channel’s business website alaswaq.net, which translates to TheMarkets.net., covers financial and market news from the Middle East in Arabic. For example, Al Arabiya covered the “strategic consortium,” which will extend a \$500 million grant to African youth to build human capital, by speeding up digital communication and training. The website also reports extensively on the execution and progress of the Saudi Vision of 2030. According to BroadcastPro, October 1, 2020, Saudi Research and Marketing Group appointed veteran journalist and former Al Arabiya executive Nabil Khatib as general manager of the upcoming Asharq TV station, based in Dubai International Financial Centre. The project is the result of a cooperation agreement between Riyadh-based Saudi Research and Marketing Group and Bloomberg and is intended to be a multiplatform Arabic-language business and financial news service.

Awards

At a summit launched by leading Arab social media influencers at the Dubai World Trade Center, Al Arabiya English won the Arab Social Media Influencer Award for media under the category of institutions, according to a December 20, 2018, report by Al Arabiya.

Al Arabiya’s Creative team won the Newscast Studio Award for Set of the Year in 2016, AR/VR category for its coverage of the U.S. elections. Al Arabiya was also selected for the Best of the Best Award in the Design Category between Vizrt

customers, numbering 3,500 customers worldwide, according to an Al Arabiya report on March 6, 2018.

Coverage of Religion

The station's current coverage of religion may be called *utilitarian* and *educational*, rather than doctrinaire. One of its programs covers the readers of the Quran from several Arab countries. Another devotes its segments to informing viewers on services available to them when they make a pilgrimage to Mecca. The station attempts to tell stories using a human-interest angle. After citing the 157,538 employees it took to make the 2017 Mecca Hajj (pilgrimage) successful, Al Arabiya English noted that the pilgrimage is about human stories. It gave the example of two Palestinian siblings who were torn apart 15 years earlier due to the occupation of the Palestinian territories. Bushra was reunited with her brother in Mecca after he left with his children to Australia. It is the story of an Omani elder who had saved up for years for his pilgrimage, only to die of a heart attack two nights before the Hajj officially began. The same article noted that Al Arabiya News Channel deployed the state-of-the-art Inspire Drone cameras to give the audience a bird's eye view of the pilgrimage.

The government's crackdown on extremely conservative Saudi clerics who issued controversial fatwas (religious rulings) freed citizens to criticize them on the Internet and on Al Arabiya. In February 2020, Sheikh Adel al-Kalbani, former Imam of Mecca Grand Mosque admitted on Rotana, the leading producer and distributor of Arabic music and film, that clerics, like politicians, make mistakes, but refused to change some of the old fatwas on women. He was met by a barrage of online criticism unthinkable in an exchange between a religious authority and a citizen only a few years earlier. A Twitter user accused the 1979 Awakening religious movement, of which he was a part, of being the main cause of women's suffering, and suggested he compensate the women hurt by that movement (Khalid, 2020). While Al Arabiya covers how crown prince and minister of defense Mohammad Bin Salman dealt with conservative clerics and with the rich members of society accused of

corruption, it does not allow vigorous criticism of the severe measures he took against dissenting women and journalists.

Viewership

Over the years, polls have differed on how popular the station has been. A U.S. State Department poll in seven Iraqi cities in October 2003 found that among Iraqis with satellite dishes, 37% named Al Arabiya as their preferred news source, followed by Al Jazeera at 26%. A Zogby Poll conducted in Jordan, Lebanon, Morocco, Saudi Arabia, Egypt, and United Arab Emirates in October 2005 asked which networks people chose for international broadcasts. The results revealed that 65% of respondents chose Al Jazeera, and 34%, Al Arabiya. However, the poll was criticized for not polling Iraqis.

Ipsos-Stat TV research revealed in November 2005 that Al Arabiya was the most watched news channel in Saudi Arabia. The report noted that the station enjoyed nearly 24% viewership during primetime, with a 1.4% lead over its closest competitor, Al Jazeera. This report prompted Marc Lynch, author of a 2015 book on Al Jazeera, to note that the headline was misleading and could easily mean that Al Jazeera appeared to be running almost even with Al Arabiya on its own home turf—only trailing by 1.4%, which may have been within the margin of error (which was not provided).

AL JAZEERA

Al Jazeera, specifically Al Jazeera Arabic, was the first global news channel broadcasting in Arabic from Qatar in the Middle East, rather than from Europe. It is the most-watched station in the Arab world, and in 2005 management consulting company Inter-Brand ranked it as the most recognizable and influential news brand globally.

The station has generally ignored Arab media laws that forbid criticism of rulers, other Arab countries, foreign ambassadors, the handling of the national currency, the army, and the frank discussion of sex and religion. Being true to its slogan, “the opinion and the other opinion,” it allows both sides of any issue to be interviewed, a feat that has won it many fans formerly subjected to official censored broadcasts, but also many enemies not used to allowing freedom of speech to their opponents.

Al Jazeera, which means “the Peninsula,” has brought the small country of Qatar to the fore of Arab and international politics, edging out Egypt and Saudi Arabia as the media leaders or funders in the Arab world. Critics and defenders agree that the station is important for

1. creating a vibrant pan-Arab and interregional news space in which viewers can discuss formerly taboo political and social issues authoritarian Arab governments can condemn, but not directly censor; and creating news bureaus that have been bombed several times but could not be silenced;
2. giving dissidents in the Arab world a forum denied them by their own governments;
3. making an Arab country an important source of international news, so that Arabs need not rely on the West for information about themselves;

4. instituting the “New World Information and Communication Order” discussed during the UNESCO debates of the 1960s and 1970s, thus reversing the direction of news transmission by making it move from East to East and West, and from South to South and North;
5. forcing Western governments to take account of Arab and Islamic public opinion, after years of relying solely on the opinion of Arab rulers;
6. forcing important U.S. government officials to play on Al Jazeera’s own media turf by granting it interviews after initially ignoring the station;
7. enabling Arab viewers to confront the reality of Israel by interviewing Israeli officials.

After reviewing the history of Al Jazeera, this entry discusses its programming, its success in beating the international media to stories, as well as concerns for its employees. The entry ends by discussing other channels within its network, including Al Jazeera English, Al Jazeera America, and AJ+.

History

The establishment of Qatar’s Al Jazeera in 1996 came through a lucky set of events. The BBC, which has always had a strong Arabic section with staff drawn from several Arab countries, signed a deal with the Saudi-owned company Orbit Communications to provide Arabic newscasts for Orbit’s main Middle East channel. When Orbit pulled out of the deal, the Prince of Qatar, Hamad bin Khalifa al-Thani, hired 150 out of the 250 BBC’s Arabic service employees. The prince financed the station in an amount of \$137 million annually, initially until November 2001, to ensure its quality. At the same time, he adopted a hands-off policy on its content, leaving that to its board of directors. Qatar continues to finance the station. By dedicating Al Jazeera to news, instead of entertainment, however, and by allowing the station editorial independence, the rulers of Qatar signaled to the Arab world that Qatar was radically departing from the Saudi practice of controlling the media they finance.

Andrew Hammond (2007), Senior Correspondent for Reuters news agency in Saudi Arabia, wrote that Saudi Arabia has expended great resources to ensure good coverage or no coverage

of its politics and society. It has done that by buying or establishing media outlets abroad, and broadcasting entertainment and “soft religion.” Saudi Arabia’s main rival before Al Jazeera was Egypt’s pre-Sadat Arab Nationalist ideology of former president Gamal Abdel-Nasser, which had not faded after his death. Hammond drew a contrast between the two approaches to media when he wrote that Nasser’s “media of mobilization” (*i’lam ta’bawi*) gave way to Saudi Arabia’s “media of pacification,” or *i’lam tanwimi*. He added that, “If Abdel-Nasser wanted you *fi-[il]shari’* (on the streets), Al Saud wants you *fi-[il]sala* (in the living room).”

The station’s embrace of dissidents from all over the Arab world led six Arab countries to withdraw their ambassadors from Qatar, while others, such as Saudi Arabia and Tunisia (before the Arab Spring in the early 2010s), refused to allow Al Jazeera to open offices in their countries. Israel also harassed Al Jazeera reporters and kept them from events others covered. Israel has attempted to ban Al Jazeera altogether.

In March 2006, Al Jazeera was formally named Al Jazeera Network. In 2020, it consists of the flagship Al Jazeera Arabic, Al Jazeera English, Al Jazeera Mubasher (Direct), Al Jazeera Documentary, Al Jazeera Balkans, and the digital platform AJ+. The network boasts having the largest news-gathering operations in the world, and bureaus in 80 countries.

By November 2007, Al Jazeera employed 41 on-air presenters, 15 of whom were women from various Arab countries, but none a Gulf national. Whereas in the past Arab stations depended on foreign news video to tell their stories, Al Jazeera relies on correspondents who represent different currents of thought drawn from all over the Arab world. An examination of staff biographies posted on Al Jazeera in 2020 shows that its reporters are a cosmopolitan and educated group who speak several languages. Al Jazeera’s bureau chief for Palestine and Israel speaks Arabic, Hebrew, and English. Al Jazeera’s correspondent in Russia is an Iraqi who received a PhD in nuclear physics from that country in 1993, and so speaks Russian. The channel’s correspondent in China is a Palestinian medical doctor who studied traditional and non-traditional medicine in China after mastering the language in 1980–1981. He has worked in China,

Laos, and Korea as a diplomat before being hired by the station. He told the *People's Daily* that, in the past, Arabs saw China through Western eyes, but that no longer needs to be the case. Al Jazeera's journalists spent a week broadcasting from China and exploring its party structure, its development philosophy, its art, theatre, and architecture. Popular with Arab audiences, however, were interviews with Chinese students who showed mastery of the Arabic language they were studying. In May 2005, Al Jazeera signed an agreement of cooperation with China Central Television (CCTV), according to Xinhua News Agency.

Programming

Al Jazeera is primarily a news and public affairs channel. The station broadcasts daily press reviews and weekly roundups in which it summarizes news reports on Middle East issues in Arab and international papers. Al Jazeera also features documentaries such as *Our History and Their Archives*, a series in which Arab history is told through the archives of mostly European powers that colonized the area in the late 19th and early 20th centuries. *The Book Is the Best Companion*, and *I Read for You*, deal mostly with academic books on Middle East politics. Both shows invite either the books' authors or professors to summarize and then discuss the selected works.

Al Jazeera was mostly known for its weekly political talk show programs, *More Than One Opinion*, *The Opinion and the Other Opinion*, and *No Limits*. Al Jazeera's popular program, *The Opposite Direction*, once pitted Safinaz Kazem, a religious woman from Egypt, against Toujan Faisal, a Jordanian feminist former member of parliament who had had run-ins with the Muslim Brothers in Jordan over her interpretation of Islam. Kazem, arguing the traditional view that marrying several wives is better than having a mistress, walked off the set while the show was on air when the discussion got heated.

Al Jazeera highlighted women's rights and their political and professional achievements in two programs, *For Women Only* and the one that replaced it, *Pioneers*. Both programs expanded women's programming beyond the kitchen and the nursery where it had resided for years. But the main contribution, according to Naomi Sakr

(2007), was their "taking as their starting point that qualified women should be aiming for decision-making jobs and that the subject of debate was not whether to aim for them but how" (p. 142).

The level of political interactivity of Al Jazeera in large part accounts for its popularity. Four broad issues occupy Al Jazeera: Palestine, Iraq, reform, and the United States, according to Marc Lynch (2006), a political scientist who is proficient in Arabic. Lynch wrote that, on the station's call-in shows he examined, "almost any voices could potentially be heard and individuals were placed into unscripted, uncensored dialogue over which hosts could exercise only some control" (p. 248). The contentious religious and ideological debates and confrontations may keep viewers coming back, but have led some critics to accuse Al Jazeera of sensationalism. While Muhammad Ayish (2005) credited *The Opposite Direction* with revolutionizing the way programs are introduced, he concluded after analyzing 10 of its episodes that its host's use of brinkmanship to egg on participants is not useful to political culture because "such talk shows need to promote real dialogue rather than sensational shouting matches among participants" (p. 125).

Al Jazeera has always covered the United States extensively, including broadcasting U.S. Central Command (CENTCOM) briefings in full. However, Al Jazeera's unedited on-air programs critical of the United States' wars and policies in the Middle East continue to get the station in trouble with Arab rulers allied to the United States and with the American administration. Lynch (2007) concluded in a study that examined the transcripts of 11 talk shows that despite various criticisms lodged against Al Jazeera, its diverse forums allow for dissenting views and reasoned analysis "albeit within a generally accepted [Arab] identity framework. These debates produced a consensus that was hostile not only to the American project, but also to the perspectives of the Arab regimes eager to stifle reform" (p. 116).

The U.S. government may object to Al Jazeera's coverage, but after September 11, 2001, its top officials have begun to address Arab public opinion which they had previously ignored. For example, during the George W. Bush administration, officials such as Secretary of Defense, Donald

Rumsfeld; National Security Advisor, Condoleezza Rice; and Secretary of State, Colin Powell; appeared on the station.

Candace Heckman reported in 2002 that the U.S. government's attempts to prevent Al Jazeera from airing the Bin Laden tapes failed, earning the station the wrath of the U.S. administration. In defense of the station, Hafez Al Mirazi, then host of *From Washington*, found that stance "ridiculous, especially coming from the leader of the free world" (Rose, 2003). British journalist Hugh Miles (2006) explained that "When Al Jazeera offers its estimated 50 million viewers exclusive interviews with Osama bin Laden, it's easy to confuse access with endorsement" (p. 20). Al Jazeera was a pioneer in interviewing Israelis; however, some of its Arab viewers accused it of being in the pay of the U.S. Central Intelligence Agency or the Israeli intelligence service, Mossad.

Al Jazeera Scoops International Media

Two events of the early 21st century serve as examples of reporting by Al Jazeera that scooped the international media. The first is the War in Afghanistan, which started in October 2001, when the United States invaded to oust the Taliban who were protecting those believed responsible for the attacks of September 11, 2001. The second is the Iraq War, which began in 2003 when a coalition led by the United States invaded to overthrow the dictatorial rule of Saddam Hussein. The following subsections discuss these and other Al Jazeera scoops.

War in Afghanistan

Unlike Western media, Al Jazeera had opened an office in Afghanistan 2 years before September 11, 2001. Prior to that, Western media had been offered the opportunity to set up news bureaus there but declined. Since September 19, 2001, when the Taliban evacuated the last foreign journalist from the capital Kabul, only five reporters—two Al Jazeera correspondents in Kabul and Kandahar and three Afghan reporters working for Reuters, Agence France-Presse, and Associated Press news—have been allowed to stay, forcing all Western stations to use Al Jazeera footage. An examination of the footage and transcripts of Al

Jazeera broadcasts of video of Afghani casualties in October 2001, however, reveals that CNN used the Al Jazeera footage, running only photos of physical damage, not the attendant human cost. In contrast, Al Jazeera went to hospitals, talked to the parents of those who had died, and showed close-ups of severely wounded and dead children.

Iraq War

During the Iraq War, Al Jazeera had eight teams all over Iraq, allowing it to scoop international media with its coverage. The staff of Al Jazeera had a hard time battling, first the Iraqi handlers before Saddam Hussein disappeared, and later, the U.S. military who detained several Iraqi Al Jazeera staff members. To answer a demand for coverage, Al Jazeera had launched an Arabic language website in 2001 to cover news of Afghanistan, and an English-language website in 2003 dedicated to special coverage of Iraq. The station concentrated on the loss of Iraqi lives, infrastructure, and culture due to the heavy bombing of Baghdad in March 2003.

When the United States bombed the Iraqi TV station, a lone former employee dug up 16 mm films from under the rubble and told Al Jazeera that the loss was not of Saddam Hussein's coverage but of the documentary history and culture of Iraq. Al Jazeera showed the destruction of the first theatre established in Iraq and the damage to the art gallery housing the works of Iraqi artists. It showed how Iraqi citizens were unknowingly using contaminated containers left by the U.S. forces, thus endangering their health.

Through its reporting, Al Jazeera neutralized some of the U.S. psychological operations (PSYOP). The coalition commanders, for example, claimed that Iraqi troops had been surrendering in droves, they reported that morale had collapsed in the south of Iraq, and that most of the Iraqi 51st Division had become prisoners of war (POWs). Al Jazeera's reports contradicted some of these claims. When a marine commander in Qatar described an Iraqi claim to have captured U.S. troops as "Iraqi lies," Al Jazeera broadcast pictures of five captured U.S. servicemen, according to Hugh Miles (2003). Al Jazeera even interviewed an Iraqi military leader the American spokesperson claimed had surrendered. The Iraqis also

made false claims of their own that Al Jazeera had broadcast and sometimes refuted.

At a time when the United States was projecting a “shock and awe” stance, Iraqi TV rebroadcast video of dead U.S. soldiers as well as video of American POWs. That, combined with the way the station covered the first Battle of Fallujah in 2004 by concentrating on civilian casualties and the plight of families who were forced to leave the city, earned the station the enmity of the American administration and some members of the American public. Such coverage led to resistance to allowing Al Jazeera to broadcast in the United States, although it was available through a Dish Network TV subscription.

The United States bombed Al Jazeera offices in Afghanistan in 2001, shelled the Basra hotel where Al Jazeera journalists were the only guests in April 2003, killed Al Jazeera’s Iraq correspondent Tareq Ayoub and two Spanish journalists a few days later when it bombed the Palestine hotel in Baghdad. According to Jeremy Scahill (2005), Britain’s *Daily Mirror* reported that during an April 16, 2004, White House meeting with British Prime Minister Tony Blair at the peak of the first U.S. siege of Fallujah, President Bush floated the idea of bombing Al Jazeera’s headquarters in Qatar, according to a leaked “Top Secret” minutes of the Bush-Blair summit. Al Jazeera’s exclusive footage was being broadcast by every major network, including CNN and BBC. The No. 10 memo raised doubts about U.S. claims that previous attacks against Al Jazeera staff were military errors.

Furthermore, following the “handover of sovereignty in Iraq” the U.S.-backed Iyad Allawi, prime minister, closed the offices of Al Jazeera and banned it from operating for a month on August 7, 2004. Al Jazeera broadcast a short clip in which accusations leveled against the station by the Saddam Hussein-era government officials were intercut with similar statements made by Allawi and his officials, suggesting that nothing had changed for the media in Iraq. Despite Allawi’s antipathy toward the station and his placing his 2005 ads in Al Arabiya, its rival, when he wanted to reach the pan-Arab audience in August 2007, he chose Al Jazeera, and even submitted to an interview by a well-informed Iraqi presenter, Layla Sheikhali.

Additional Scoops

The station continues to scoop international media and even Arab media in different countries. For example, in July 2007, Al Jazeera showed ballot stuffing in Egypt, shot via a long lens through a window of a polling center.

Al Jazeera has had a profound effect on Arab public opinion. Demonstrations erupted in several Arab countries in support of Palestinians after Al Jazeera broadcast images of the 2002 Israeli siege of the city of Jenín. Its broadcast of the Arab Spring in Tunisia and Egypt in 2011 has been credited with giving those revolutions unprecedented real-time coverage. With contributions from Arab revolutionaries on the ground, the station was able to bypass two sources of marginalization of Arab public opinion: Arab governments that used to control traditional borders and prevent journalists from other Arab or foreign media from entering their countries; and Western news agencies, which many Arabs felt treated their issues unfairly.

Attacks Against Al Jazeera Employees

Most Arab countries as well as Israel have at one time or another censored Al Jazeera, expelled its correspondents, or closed its offices. In 2017, Bahrain, Egypt, Saudi Arabia, and the United Arab Emirates boycotted Qatar and imposed 13 conditions on the country, including closing Al Jazeera, in order to lift the boycott. Qatar, with the help of Iran and Turkey defied the boycott and the conditions imposed on it, and Al Jazeera remained open.

Israel, which in the past had excluded Al Jazeera reporters from official briefings, plans to ban the channel for good. In 2020, Israel’s communications minister introduced a draft bill that would allow the government to close Al Jazeera’s Israel bureau, revoke its license to broadcast on local cable and satellite channels, and strip its journalists of accreditation, according to an August 10, 2017, op ed column by Sherif Mansour in *The New York Times*, titled, “‘The Middle East’s Only Democracy’ Goes to War on Press Freedom.” In May 2021, Israel’s military destroyed a tower in Gaza in which Al Jazeera had a bureau.

Al Jazeera photographer Sami Al-Hajj was kidnapped on his way to Afghanistan on assignment as an Al Jazeera cameraman on December 15, 2001. Even though he had a valid visa, he was held at Guantanamo as an “enemy combatant” for 6 years. His lawyer, Clive Stafford Smith, attested that he was tortured by U.S. interrogators. Stafford Smith noted that during 125 of 130 interviews, U.S. officials had questioned Al-Hajj on whether Al Jazeera was a front for terrorist organization al Qaeda, and were more interested in recruiting him as an informer than interrogating him for what he had supposedly done. He and others went on a 438-day hunger strike, during which they were forced, according to reporting from Reporters Without Borders (2006). Al-Hajj was released in 2007.

Daniel Marans, writing for HuffPost, noted in June 9, 2017, that Egyptian president Abdel-Fattah el-Sisi and his Saudi and Emirati backers accused Qatar of using Al Jazeera to promote the Muslim Brotherhood, which they deemed a terrorist organization. Al Jazeera argued that it was merely covering popular opposition to the el-Sisi coup and the victims of the government’s repression. El-Sisi’s forces nonetheless arrested three Al Jazeera English journalists in December 2013 on trumped-up charges of involvement with the Brotherhood. Egypt did not release them until 2015, after Al Jazeera shuttered its Arabic-language Egyptian channel Mubasher MISR [Egypt Direct] in December 2014.

Israeli Ha’aretz columnist Zvi Bar’el wrote on August 22, 2017, in a column titled, “It’s Fun to Hate Al Jazeera,” that while he believed that Al Jazeera was not objective because it does not criticize “the corruption and evils” of Qatar, he added that something similar may be said about the Israeli right-wing daily Israel Hayom, and Fox News, neither of which criticize their “lords and masters.” He added that it was “too easy, very cowardly . . . to join the Arab and Israeli tradition of tarring and feathering Al Jazeera as the enemy of the world.” While attempting to revoke the credentials of a senior Al Jazeera journalist in Jerusalem is a desperate move, “But at least Israelis will have Al Jazeera from which to learn about what’s going on in their country and the areas it occupies.”

A special issue devoted to Al Jazeera in *Al-Hadath* magazine in March 9, 2000, concluded that 50 years from that date, “historians would rate the establishment of Al Jazeera as one of the most important events in the Arab political arena at the end of the century.” Others credit the station for loosening the stranglehold of Saudi money on Arab media globally, and many credit it with helping to spread the revolutionary message of the Arab Spring in Tunisia and Egypt.

Al Jazeera English

Al Jazeera English (AJE) identifies itself as a channel that focuses on events that affect people’s lives by highlighting topics that often go underreported, presenting all sides of the story and giving a voice to the voiceless. AJE boasts on its website that it is “reshaping global media and constantly working to strengthen our reputation as one of the world’s most respected news and current affairs channels.” The number of prestigious awards AJE has won in recent years attests to the accuracy of that boast.

On April 21, 2020, the New York Festival TV & Film Awards named AJE “Broadcaster of the Year” for the fourth consecutive year. The channel won 14 gold, 19 silver, and 23 bronze medals for its news coverage and programs as well as for its Investigative Unit and its Digital Division. In recent years, AJE has won a Peabody, an Emmy, an NRMA Kennedy award for Excellence in Journalism, and a Royal Television Society award. In 2020, one of its documentaries was nominated for an Academy Award. The channel was competing with entries from over 50 countries, according to an April 22, 2020, post by AJE. Al Jazeera Media Network has won four Webby awards. The network was competing with more than 13,000 entries from media organizations including The Washington Post, National Geographic, Disney, The New York Times, HuffPost, and Vox.

AJE started broadcasting as a 24-hour English-language news and current affairs channel on November 15, 2006. Even though it set as its original launch target 40 million cable and satellite homes, in 2020 it broadcast to more than 310 million households in more than 140 countries. Al Jazeera has more than 3,000 staff from over 70

nationalities, making its newsrooms the most diverse in the world. The channel covers Asia, Africa, and Latin America daily, not just when disasters strike.

AJE is now determined to obtain broad distribution in the highly competitive United States market, which has been closed to it due to conservative pressures on cable TV stations as well as commercial considerations. The news station has attracted veteran journalists from around the world. Delinda Hanley (2007) quotes Mark Seddon, AJE's UN and New York correspondent, that U.S. news has become "infotainment." He sees AJE as an alternative to American stations that chase ratings by catering to the lowest common denominator. Because Qatar's prince funds Al Jazeera Network, it is free from the economic pressures that drive U.S. media. AJE broadcasts from Doha, Qatar; London, Washington, DC; and Kuala Lumpur, Malaysia; and has 80 supporting bureaus—in the Middle East, Africa, Europe, the Americas, Asia, and Australia. AJE has a strong presence in Africa through its bureaus in Egypt, Ivory Coast, Kenya, South Africa, and Zimbabwe, and it shares the resources of Al Jazeera Arabic channel's African bureaus located in Chad, Libya, Mauritania, Morocco, Senegal, Somalia, South Africa, and Sudan.

The station seeks out interesting stories neglected by the Western-oriented media in Latin America, Southeast Asia, the G8 countries (Canada, France, Germany, Italy, Japan, Russia, United Kingdom, and the United States), and the Middle East. Half a million of Al Jazeera's viewers are Israeli. AJE is also seeking a deeper penetration in India and China. In the United States, the station may be seen via Buckeye Cable, Ohio; Burlington Cable, Vermont; Washington Cable; Fision (IPTV), a fiber-optic entertainment network seen only in Houston. Elsewhere, viewers may view the station on several Internet sources.

When the station first started, there was some dispute over its identity, with some in the Arab world suggesting that it is of no use to fund such a station if it would be no different than other Western TV stations regarding Arab issues, a view expressed by Khalid Amayreh (2006). But AJE sees itself as the world's first global English language news channel to be headquartered in the Middle East. Its website notes that

From this unique position, Al Jazeera English is destined to be the English-language channel of reference for Middle Eastern events, balancing the current typical information flow by reporting from the developing world back to the West . . . The channel gives voice to untold stories, promotes debate, and challenges established perceptions.

Al Jazeera's Digital Platforms

Al Jazeera English's entry into the digital media field started in 2014 with AJ+, whose short clips garnered over 5 billion views. That was followed by a pioneering effort by Dima Khatib who started AJ+ in Arabic, designed to attract Arab youth to Al Jazeera in platforms they use and understand.

According to Al Jazeera Management Profile (2020), Dima Khatib, who holds a master's degree in translation from Geneva University in Switzerland and speaks eight languages, is the Managing Director of AJ+ digital platform in its three languages: English, Arabic, and Spanish. Khatib started with Al Jazeera Arabic in 1997 as a broadcast journalist. She became a news producer, known for managing the coverage of the invasion of Iraq, was the first female bureau chief of Al Jazeera. Following her intensive coverage of Arab Revolutions on social media, Dima was classified as the most connected woman on Twitter in the Middle East in 2012. She used that skill in 2016 when she invited 100 young Arab media influencers to Qatar to launch AJ+ digital platform in Arabic. AJ+ won the Shorty award for the best presence on Facebook, and two Webby awards, one for news and the other for its coverage of refugees in Europe.

Al Jazeera's decision to establish and then strengthen its digital platforms attracted younger viewers, as it reported on March 25, 2020, had achieved a record of 1.4 billion viewers over the previous 90 days. This number represents an increase of 20.8% compared to the preceding 3 months, and an increase of 31% compared to the same period in 2019. Al Jazeera's digital section provides content in six languages, reaching its audience through various platforms and state-of-the-art applications. According to Al Jazeera Media Network, on June 19, 2019, Al Jazeera

Digital won a One World Media Award, for its interactive graphic novel *Lost Childhoods*, with its “skillful weave of investigations, videos, photos and illustrations that brings to light” disturbing physical, emotional, and religious abuse against children in Nigeria by branding them as witches.

Al Jazeera’s interactive unit, AJLabs, not only produced this graphic novel but also worked with nongovernmental organizations to translate it into local languages for distribution in schools and churches in Nigeria, in an attempt to educate people and end the practice. *Lost Childhoods* won against shortlist nominees PBS *Frontline* and the BBC’s *Africa Eye*. It was the second win for the interactive unit, which also won top prize in the innovation category at the Amnesty Media Awards ceremony on April 3, 2019.

Also in 2019, Al Jazeera entered the podcast market with four Arabic shows, including the Arab world’s first daily news podcast. Al Jazeera teamed up with Wondery’s flagship *Business Wars*, and introduced it to the Arabic-speaking markets.

Al Jazeera America

In an attempt to enter the American market in January 2013, Al Jazeera Media Network bought Current TV and started broadcasting on August 20, 2013. Despite its focus on American topics, the station’s offerings were more hard news and documentary in nature than entertainment, and averaged only 28,000 viewers. The network ceased operations in April 2016 citing economic reasons, making it the only Al Jazeera Network project that to date has failed.

AL-MANAR

Al-Manar (The Lighthouse) TV is the mouthpiece of Hezbollah (The Party of God), established between 1982 and 1986 as an umbrella organization uniting religious Shi'a groups in the wake of the 1982 Israeli invasion of Lebanon. Al-Manar plays an important role in resisting the alliance between Israel, the United States, and its regional rival Saudi Arabia. Despite being censored, blocked, and bombed at every turn, the station continued to broadcast to the Middle East and beyond with the help of the Internet, thus fulfilling its aim to be the voice of the voiceless. This entry discusses Al-Manar as mobilized media, as well as its programming, sources, and relations with Israel and the United States. The entry also examines attacks against Al-Manar and its use of

language. The entry closes with a discussion of censorship of the channel.

Al-Manar started broadcasting on June 3, 1991, as a terrestrial channel. Muhsen writes in his 1998 book *The Information War: Examples of Resistance Media in Lebanon* that Hezbollah developed a strong information apparatus to serve international journalists. After the 1996 conflict with Israel, 1,200 journalists visited Hezbollah's information center, which also issued 474 briefings and distributed 200 videos to news agencies. Hezbollah played a major role in ending Israel's 22-year occupation of the South of Lebanon, with the exception of the Sheba'a farms which Israel still occupies in 2021. Al-Manar got a license for satellite transmission just in time for broadcasting the Israeli withdrawal from most of the South on May 24, 2000, and the Palestinian uprising against Israel in late 2000, both of which boosted its viewership in the Arab world.

Al-Manar as Mobilized Media

Al-Manar does not claim neutrality but bills itself as partisan to the cause of its constituents, initially, the disadvantaged and poor Shi'a of the South and the Beka'a valley; later expanded to include the Arab and Islamic worlds. As Al-Manar explained on its website when it was first established, the need for the channel arose because, even when 20% of Lebanon was still under Israeli occupation, it was not unusual for the south and Beka'a Valley to be under Israeli fire while existing TV stations were broadcasting frivolous programs. Al-Manar saw itself as providing programming that reflected the suffering of the occupied people in South Lebanon.

Its adopted slogan, "The channel for Arabs and Muslims," is a direct challenge to Saudi Arabia's stress on Islam, rather than Arabism, as well as a nod to its Lebanese audience, 38.4% of whom are Christian. Since 2006, Hezbollah has been in alliance with President Michel Aoun's Maronite Christian party, the Free Patriotic Movement. Al-Manar, however, is detested by another Lebanese Christian group, the right-wing Lebanese Forces political party.

Programming

While other Lebanese stations broadcast the equivalent of *Who Wants to be a Millionaire*,

Al-Manar aired in 2004 a game show called *The Mission*. In it, says Neil Macfarquhar, contestants from around the Arab world competed for cash and the chance to win a virtual trip to Jerusalem, the location of Al Aqsa Mosque. As of 2020, the station quizzes its contestants on Arab and Islamic history rather than on frivolous subjects. Al-Manar conducts regular viewer self-selected polls with leading questions that tackle issues of the day. For example, it asked in January 2020 whether Trump committed a major folly by assassinating Soleimani and Al-Muhandis in Iraq. Out of 919 responses, 90% answered “yes,” while 10% answered “no.” When President Trump tweeted a message to the Iranian people in Farsi, Al-Manar’s headline on January 12, 2020, read: “Iran’s Reaction to Trump’s Tweet: Don’t Dishonor our Language.”

Under the “Main List” of program offerings, Al-Manar includes, News, Political Programs, General Programs, the Speeches of Hassan Nasrallah, Films, and Series. The second list contains Documentaries, Resistance, Health, Sports, Culture, and Varieties. The station forbids advertising for tobacco or alcohol or any advertising that treats women as sexual objects to sell products. Female announcers appear in head scarves, but are news presenters. Dr. Anne Marie Baylouny, in a paper to the George Marshall European Center for Security Studies, wrote in 2006 that the station highlights practical problems of women and offers solutions women propose.

Media Sources of Al-Manar

While other Lebanese stations depend on Western news agencies, Al-Manar mostly uses Syrian and Iranian news agencies for news and documentaries. Al-Manar also makes extensive use of Iranian dubbed films and television series, and Syrian series. The station archives the full speeches of the Lebanese Secretary General Hassan Nasrallah, as well as the speeches of the leader of the Iranian Revolution, Ali Khamenei.

Al-Manar’s Relations With Israel

Al-Manar pioneered the idea of embedded videographers who accompanied Hezbollah fighters on their missions and showed them battling Israelis

on Lebanese soil, then planting Hezbollah’s yellow flag on abandoned Israeli positions. Photos of these exploits as well as news clippings in Arabic and Hebrew are included in Muhammad Muhssen’s 1998 book, *The Information War: Examples of Resistance Media in Lebanon*. The channel admitted it was deliberately trying to sow fear into the hearts of Israeli mothers by convincing them, in Hebrew since 1996, that it was futile to fight against Hezbollah. The station showed video of dead Israeli soldiers and published a list with some blank spaces, then asked who was next. Israelis trusted the information Hezbollah gave them through Al-Manar during the 2006 Israeli attack on Lebanon more than the reports of their military spokespersons. A study by Dr. Uri Lebel of the Ben Gurion Institute, Beer Sheva University, has found the leader of Hezbollah often contradicted the Israeli spokespeople and was the first to announce the deaths of Israeli soldiers and the circumstances that led to their deaths. Lebel was quoted by Ynet.News.com, the English-language website of the Israeli daily *Yedioth Ahronoth*. In an opinion piece on June 12, 2019, David Daoud said Israeli leaders such as former IDF Deputy Chief of Staff Yair Golan, admitted that Hezbollah’s most devastating threat to Israel was not its missiles, but its ability to sow fear. By amplifying its threats, he said, Hezbollah has learned how to turn them into military achievements.

Attacks Against Al-Manar

On July 12, 2006, Israeli warplanes demolished Al-Manar’s five-story headquarters in Beirut’s southern suburbs, injuring three staff members. They also hit the station’s infrastructure in the Beqa’a valley. Al-Manar went off the air only for 2 minutes; the station’s cadre of engineers kept the station broadcasting from an undisclosed location. Al-Manar points out with pride in documentaries how, with the help of Iran, Hezbollah rebuilt in record time what Israel had destroyed. The fact that Al-Manar continued to operate was considered a victory, even though Israeli hackers inserted on Al-Manar TV content ridiculing Hezbollah’s leaders and fighters.

Al-Manar Website Team notes that its website launched in 2000 was its way of evading censorship of the victories of the Lebanese Resistance of

Hezbollah, and a way to expose the Zionist entity's crimes in countries where Al-Manar frequencies are blocked. Al-Manar notes that its website features the latest multimedia technologies and is available on several platforms and on phones.

As Saudi Arabia and other Gulf countries started establishing relations with Israel, Al-Manar increased its attention to the Palestinian news it had long championed. The station extensively covered the Israeli attacks on Gaza in 2009, 2012, 2014 and the border clashes in Gaza of 2019 and 2020. While President Trump's advisor, Jared Kushner, was attempting to get Saudi Arabia's help funding and selling his proposal for Israeli-Palestinian peace, Al-Manar kept on its front page the August 10, 2019, speech Iranian leader Ali Khamenei delivered to the pilgrims of "the House of God" in Saudi Arabia, criticizing the American policy on Palestinians and urging all Muslims to support them against the Deal of the Century, which it called *a trick*.

Al-Manar's Relations With the United States

In April 1983, the U.S. embassy in Beirut was struck by a 400-pound suicide truck bomb which killed 63 people, including 17 Americans, and wiped out the Central Intelligence Agency's Middle East bureau. A truck full of explosives on October 23rd, 1983, killed 241 U.S. Marines and soldiers in their barracks, prompting President Reagan to pull troops out of Lebanon in February 1984. The same attack killed 58 French troops. At that time, Hezbollah accused the United States and France of taking sides in a Lebanese internal conflict, but those attacks have turned Hezbollah and its TV station into the enemy of both countries.

When Al-Manar covered the invasion of Iraq in 2003, it ridiculed the American military by juxtaposing its claims of precision bombing over photos of dead children. Al-Manar depicted the Statue of Liberty as a skeleton, brandishing a blade dripping with blood. After the Abu Ghraib torture photos were broadcast, Al-Manar taunted the United States over its human rights abuses. In one of its quiz shows, Al-Manar asked for the name of the structure built in 1792 that became the source of all oppressive decisions the world over. Its

answer was: The White House, according to a 2004 article by Kim Ghattas.

After the United States assassinated the leader of the foreign wing of Iran's Islamic Revolutionary Guard Corps, Qassem Soleimani, on January 3, 2020, Al-Manar went on a daily attack on U.S. policy on Iran and the region, promising revenge.

Al-Manar's Use of Language

Al-Manar is especially sensitive to the language of conflict. It objects to calling the 10-mile strip Israel still occupies in the South "the security zone" as Israel and the international media had been doing. While Israel calls its army, the Israeli Defense Forces (IDF), Al-Manar calls it the Israeli Occupation Forces (IOF). Sometimes, Al-Manar uses the terms the *Zionist Forces*, or the *Zionist Army*. Its Hot Topics section lists "The Israeli Enemy" as a search category. Al-Manar calls fighters Israel killed martyrs. Hezbollah fighters often leave archived video wills that explain why they chose martyrdom. The station also archives short video clips of family members or friends of martyrs praising their sacrifice and explaining why it benefits the country. The station glorified its martyrs on Martyr Day on November 11, 2019, with a speech by Secretary General Hassan Nasrallah, and in song and resistance videos.

Al-Manar's most potent assets are the political pronouncements and speeches of Hassan Nasrallah in which he adopts the stance of a family member who is telling intimate stories about other family members dear to the audience. In that way, Hezbollah, through Al-Manar, controls the narrative and reframes how events should be understood. For example, to dismiss the notion that the assassination of Soleimani was a victory for the United States, Nasrallah revealed that Soleimani had lamented to him that he had white hair but had not yet attained martyrdom and wished he would not die in bed. Nasrallah added that Hezbollah wins if it fights and no one gets martyred, but it also wins if a martyr "ascends" to heaven. But more than narrative, style matters. Nasrallah mixes classical Arabic with the more intimate Lebanese colloquial Arabic to keep audiences enthralled by his personal anecdotes. His use of colloquial

language is reminiscent of the late Egyptian president Gamal Abdul Nasser, known as a *master communicator*.

Although Al-Manar's enemies accuse it of serving as a voice for terrorism, Dr. Anne Marie Baylouny has written that one could also view Al-Manar as an opposition or resistance media that covers the nondominant perspective, by airing interviews with Palestinian rejectionist groups in Syria and with Hamas in Gaza and the West Bank.

Censorship

On December 14, 2004, the global satellite television operation, Al-Manar, was designated under section 212(a)(3)(B)(vi)(II) of the Immigration and Nationality Act, placing it on the Terrorist Exclusion List and preventing it from operating in the United States or receiving any funds from U.S. citizens, according to a U.S. Department of State Press Statement.

The crusade against Al-Manar TV would not have come about without outside pressure, however. Trish Schuh, in an article titled, "Free Speech 'Marked for Death': Lebanon's Al-Manar TV Targeted," wrote that Natan Sharansky and former Israeli Foreign Minister Silvan Shalom originated the idea of preventing Al-Manar from broadcasting via satellite. They teamed up with several organizations, including the Anti-Defamation League, CAMERA.org, American Jewish Congress and the Foundation for the Defense of Democracies, and American Israel Public Affairs Committee. Furthermore, Middle East Media Research Institute (MEMRI) took credit for persuading Germany, Sweden, Australia, and France to outlaw Al-Manar. The Netherlands and European Union countries followed suit. The coalition against Al-Manar also coerced Spain into removing Al-Manar from Latin American programming. According to a Doreen Carvajal article in December 15, 2004, France's highest administrative court banned Al-Manar for repeatedly violating the country's hate laws. Al-Manar transmitted programs that included commentary accusing Jews of spreading AIDS, as well as a 26-part Syrian-produced series in which a Jewish man demanded the blood of a Christian child to bake Passover matza bread.

Jewish groups in France and the United States had pressed for a ban. Al-Manar's management apologized for airing the series, dropped it, and explained that the station had purchased it without first viewing the entire series, according to Franklin Lamb's article of January 1, 2010. Furthermore, the channel was the first to condemn the September 11, 2001, attack, as anti-Taliban and anti-bin Laden and cheered Hezbollah as it fought Islamic State of Iraq and Syria.

Reporters Without Borders has urged Washington and Paris not to confuse the fight against anti-Semitism with the fight against terrorism. While it found the anti-Semitic statements Al-Manar broadcast "inexcusable," it argued that putting Al-Manar in the same category as a terrorist organization was dangerous to those who work with it and those who report on it.

In November 2019, however, Twitter suspended all of Al-Manar's news accounts and shut down many of its reporters' accounts as well as the accounts of 1 million of its followers. Al-Manar TV accused Twitter of yielding to "political pressure" and stepped up carrying anti-American news on its website. On January 24, 2020, Al-Manar published the headline, "In Pictures: Huge Masses of Iraqis Protesting against US Presence." The photo showed Iraqi demonstrators with two large cutouts held on sticks, one of President Trump in a suit, the other of him in orange prison garb.

The issue of preventing the transmission of Al-Manar is seen by some Arabs and Muslims as an example of the hypocrisy of Israel and Western governments and the press who defend their right to broadcast anti-Muhammad cartoons and other anti-Arab offensive material in the name of free speech, but feel threatened and call for censorship when others transmit offensive programming. Meanwhile, Al-Manar continues functioning despite an advertising boycott, and despite the refusal of several international satellites to carry it. Al-Manar is now available on its own website in Arabic, English, French and Spanish, and on YouTube.

ALTERNATIVE NEWS MEDIA

Alternative news media is a concept that describes and explains an ideologically diverse array of media activist and journalistic initiatives around the world. While the term has been used to retroactively analyze historical forms of activist reporting, including the abolitionist, labor, and women's movement presses of the 19th century, it was initially theorized in the latter half of the 20th century. It first became widely used in the 1980s among media scholars and activists interested in explaining or lending coherence to the historical proliferation of underground and left-radical periodicals during the 1960s and 1970s.

Less useful as an ontological category than as a description of a relation, the alternative press is often considered (and its practitioners often consider themselves) vis-a-vis a more dominant or "mainstream" press. Its conceptual underpinnings are typically rooted in Marxist and post-Marxist theoretical frameworks, often building upon Italian philosopher Antonio Gramsci's concept of "cultural hegemony"—the notion that social and cultural norms, as well as the ideas that are taken as common sense by mainstream journalists, reflect the ideology of a society's ruling class. While typically associated with left-radical movements, alternative news media is an increasingly salient term in the study of right-wing and modern conservative media, both in the United States and beyond. This entry discusses the origins of the term and theories and practice surrounding alternative media. It concludes by looking at the categorization by some of right-wing media as alternative media.

Origins of the Term

There is no settled definition of the term *alternative media*, which has been variously defined by

scholars and activists united by a shared, if expanding, object of analysis.

David Armstrong developed the term in his 1981 book, *A Trumpet to Arms: Alternative Media in America*. For Armstrong, a former editor of the underground weekly newspaper the *Berkeley Barb*, “alternative media” described journalists like him—those with an underdog disposition who blended reporting with political activism in promotion of idealistic visions of a better world. Armstrong employed the concept to link the work of his colleagues in U.S. counter-cultural periodicals with their, broadly conceived, historical predecessors—from U.S. Revolutionary War era pamphleteer Thomas Paine, to abolitionist journalists of the 19th century, to the muckraker reporters and socialist presses at the turn of the 20th century. He argued that these various journalistic endeavors shared common characteristics with the underground press of the 1960s and 1970s: They served as tools for community action and organizing. They rejected impartiality or neutrality. They amplified unheard or underrepresented peoples and their struggles. They often participated in the political movements they covered. Armstrong, therefore, saw alternative media as a historically recurring phenomenon serving a crucial function within movements for social and political change.

Armstrong conceded that there are considerable differences among alternative media. Most notably, the alternative media he studied employed a variety of funding models and organizational structures—some even relying upon advertising revenues and hierarchical decision-making practices that often contradicted the periodicals’ editorial advancement of egalitarian and anti-consumerist ideals. This raised the question of exactly how alternative media differ from their mainstream counterparts—a question that has since sparked considerable debate among scholars and activists alike, as we will see below. In *A Trumpet to Arms*, Armstrong posited a two-way relationship between alternative media and the dominant society. “Not only do ideas introduced by alternative media modify society,” he wrote, “they also are themselves modified in the course of being absorbed by mainstream culture” (1981, p. 25). He saw alternative media as a catalyst of social and cultural change, engaged in a struggle

against an otherwise obdurate mainstream media over the contours of the prevailing political common sense and interpretations of the news of the day.

Drawing upon now-classic studies by media sociologists Herbert Gans (*Deciding What’s News*, 1979) and Todd Gitlin (*The Whole World Is Watching*, 1980), Armstrong characterized the “mainstream” press in the United States as upholding small-c conservative political values—though not explicitly partisan, the mainstream press was generally supportive of capitalism and U.S. global military dominance, geared toward advancing the status quo interests of political, cultural, and business elites. This analysis was common of an influential strain of progressive media criticism that also emerged in the 1980s, led by journalist Ben Bagdikian and scholars Edward S. Herman and Noam Chomsky. By and large, professional journalists working at commercial outlets in the United States during this time period still adhered to what historian Daniel Hallin has called *high modern* journalistic values—a commitment to objectivity in reporting and conveying the news in a straightforward, dispassionate tone.

Bagdikian, who wrote the preface to Armstrong’s book, raised doubts about the putative impartiality of the mainstream press in his 1983 book *The Media Monopoly*. Rekindling structural media criticism first developed by progressive journalists in the 1940s, Bagdikian contended that increasing concentration of media ownership resulted in constraints on journalists’ ability to challenge the status quo. Herman and Chomsky took this a step further in their 1988 book *Manufacturing Consent*, arguing that the mainstream media was unwittingly complicit in a propaganda campaign to legitimate capitalism and U.S. imperialism overseas. It was in this context that alternative news media first gained conceptual salience—as both a description of real-existing activist journalistic initiatives beyond the control of an increasingly concentrated corporate mass media, and as a normative theory for identifying reporting practices capable of challenging various interlocking systems of oppression.

Another key early study of alternative media was John D. H. Downing’s *Radical Media: The Political Experience of Alternative Communication*, first published in 1984. Whereas Armstrong

had primarily focused on the alternative press (periodicals and radio programming geared toward news and commentary), Downing expanded the conception of alternative media to encompass radical media practices beyond news reporting and analysis—from street theater and murals to song and dance. Downing's study also extended the concept of alternative media geographically—comparing alternative media in the United States with examples in Portugal, Italy, and Eastern Europe. Engaging with anarchist and feminist theories of political organizing and communication, Downing attempted to theorize democratic communication beyond a highly reductive, Cold War era East-West binary. His resulting conception of alternative media was unusually broad and characterized by movement-oriented self-management, autonomy from both corporate and state influences, and a critical disposition toward the powers that be in a given society.

Theories of Alternative Media

If earlier studies of alternative media tended to use critical or left radical content as a basis for distinguishing the alternative press from its mainstream counterparts, media theorists in the early 21st century sought to develop more robust theoretical frameworks for defining and understanding the phenomenon.

Some, most notably Chris Atton, focus on the modes of production and organizational practices that make alternative media distinct as a form of communication. In *Alternative Media*, an influential work first published in 2001, Atton contends that content is one among many elements that make particular media projects alternative. Atton suggests defining alternative media according to their ability to generate nonstandard and subversive methods of creation, production, and distribution. Media that rely upon advertising revenues or hierarchical decision-making would not count as alternative, according to this view. Atton also extends the conception of “production” to include audiences, arguing that among alternative media's unique traits is their ability to offer a means of democratic communication to people who are normally excluded from engaging in media production—that is, they invite and enable audience

participation and reflexivity about their relationship to the production process.

Other scholars, most notably Jennifer Rauch, situate alternative media in the eye of the activist beholder. Audience-oriented approaches to understanding alternative media acknowledge that the interpretive strategies used to read, view, or listen to media play a role in distinguishing the alternative from the mainstream. Often audience perceptions of alternative media are less focused on production processes than on content, meaning that even corporate mass media might be considered alternative depending upon a particular audience member's vantage. While helpful in explaining common vernacular understandings of infotainment programs such as *The Daily Show* (1996–) or the cable channel Fox News as “alternative,” audience-oriented approaches complicate clear cut distinctions between alternative and mainstream media.

Still other scholars, such as Leah Lievrouw and Joshua Atkinson, attempt to bridge the production/consumption divide by applying media genre theory. Genres operate according to conventions that structure the content that media makers produce, as well as the assumptions and expectations their audiences have about that media. In her 2011 book, *Alternative and Activist New Media*, Lievrouw outlined five distinct alternative and activist media genres, based upon their content and functionality: participatory journalism, mediated mobilization, commons knowledge, culture jamming, and alternative computing. The first three of these involve crowd- and audience-sourced newsgathering and circulation methods, as well as mobilization-oriented coverage of events or protests. In his work, Joshua Atkinson has noted that the first three are more applicable to the analysis of alternative (as opposed to activist) media. Building on Lievrouw's genres, Atkinson defines alternative media as distinct from other media in terms of content (critical or oppositional toward dominant power structures), production (employing participatory sourcing methods), and audience interpretation (as distinct from mainstream media).

Similarly focused on attending to alternative media's unique methods of production, distribution, and consumption are Olga Bailey, Bart Cammaerts, and Nico Carpentier. Their 2006 book,

Understanding Alternative Media draws upon post-structuralist and postmodernist theories to resist essentialist notions of alternative media as somehow inherently noncommercial or radical. They contend that alternative media's relationship to the mainstream is only one of several relations that shape its historically contingent forms and contents. They offer four interconnected theoretical approaches for understanding the full interventions of alternative media in a given society. First, they argue that alternative media serve communities, opening channels of communication for misrepresented, stigmatized, or repressed social groups with the goal of validating and empowering them. Second, they argue that alternative media are engaged in counter-hegemonic discursive struggles with the mainstream media over what constitutes common sense, erring on the side of self-representation for those excluded in conventional media narratives. Third, they see alternative media as providing a crucial link to civil society, offering a pathway for political participation previously unavailable to marginalized groups. Lastly, they theorize alternative media as a "rhizome," by which they mean that alternative media serve to link otherwise distinct democratic struggles, enabling new forms of political identity and solidarity to emerge.

Another, more recent, approach that similarly disrupts essentialist or fixed notions of alternative media is Linda Jean Kenix's continuum model. Kenix argues against thinking of alternative media as conceptually distinct from mainstream media. She theorizes the relationship between alternative and mainstream media not as a binary, but as a spectrum. While acknowledging important differences between alternative and mainstream news media outlets—in terms of individual motivations, organizational practices, media ownership, and ideological influences—Kenix points to shared norms and routines among alternative and mainstream journalists as well as the shared commercial pressures of sustaining a news outlet in a capitalist economy. These similarities result in a convergence among both mainstream and alternative media toward news practices that emphasize social networking and individual empowerment—values that were once more common among the alternative than the mainstream.

While scholars have taken pains to theorize the alternative press—how and why it functions as a social and cultural change agent, its capacity for counter-hegemonic struggle, its coproduction between alternative journalists and their audiences, its differences from the mainstream news media—they have often had practical case studies in mind while doing so. Activists themselves have shaped the meaning of the alternative press through praxis.

Alternative Media Praxis

There is a long history of journalistic endeavors, both in the United States and globally, that fit the alternative media mold, but precede it conceptually. Many political movements of world historical proportions—from the transnational struggle to abolish slavery to early feminist campaigns for suffrage and gender equality—were rooted in robust print cultures, with myriad periodicals designed to give voice to communities who were not at the time considered to be capable of full human agency or political citizenship. The reporters and commentators associated with these movements, as well as the socialist, anarchist, and labor presses that advocated for the concerns and rights of workers around the turn of the 20th century, were typically self-published or published by movement or party-aligned periodicals—building what theorist Nancy Fraser has termed "counter-publics," capable of developing oppositional or alternative discourses and framings of the news of the day in an effort to shift broader public sentiments. These radical print cultures persisted well into the 20th century, although they were variously impeded by periods of political repression. From the late 1940s onward, they were joined over the airwaves by the Pacifica radio network, which operates noncommercial, listener-supported radio stations known for airing progressive interpretations of the news of the day.

As noted earlier, the term *alternative media* was initially coined to explain the proliferation of underground newspapers and other radical periodicals associated with the global New Left and countercultural movements of the 1960s and 1970s. During those decades, youth movements emerged in countries around the world, aligning with popular and working-class struggles against

racism, colonialism, and war. These movements not only advanced radical (often Marxist or anarchist) social and political visions but also pushed for looser cultural norms around drug use, sexuality, and gender performance. They gave rise to hundreds of underground newspapers, whose role was not only to chronicle the movements but to give voice to a wide array of marginalized social groups with whom the movements were aligned politically and culturally.

By the end of the 1960s, approximately 500 underground newspapers were being published (most weekly or intermittently) in the United States alone, with most major cities laying claim to at least one. Among the first were the *Los Angeles Free Press*, or *Freep*, which began publication in 1964, and the *Berkeley Barb*, a particularly influential paper founded in 1965. At its peak in 1968, the *Barb* had a weekly circulation of 90,000. Both papers joined with 60 others in 1967 to form the Underground Press Syndicate, a wire service that enabled local underground newspapers to share information, commentary, and news to communities across the United States. Similar underground newspapers emerged in countries throughout the world, among them the *Black Dwarf* in the United Kingdom, *Sydney OZ* in Australia, and *Actuel* in France.

In the United States and Canada, many of these underground newspapers disappeared by the late 1970s and 1980s, as do-it-yourself punk and anarchist subcultures turned away from newspapers toward the production of zines. Those alternative newspapers that remained, most notably New York's *Village Voice* (which, founded in 1955, both preceded and outlasted its New Left underground counterparts) adapted to compete within their local commercial media markets—relying upon classified advertising revenues, and selling ad space to businesses deemed too unseemly by more mass audience daily newspapers (e.g., sex workers, night clubs, and drinking establishments). From the 1960s through the early 21st century, when they were starved of revenue as classified advertising migrated to free online platforms, alt-weekly newspapers could be found in most major U.S. cities, where they served as sites of journalistic innovation—specializing in critical arts and culture reporting, as well as more subjective, literary long-form pieces characteristic of

New Journalism, and deep-dive investigative reporting into social and political issues of both local and national concern. By the end of the 20th century, these periodicals largely maintained their countercultural edginess but moderated somewhat politically. Still mostly liberal or progressive, few advanced the radical political visions of their underground predecessors.

The turn of the 21st century saw the emergence of a global justice movement, opposing the transnational expansion of corporate power enabled by international institutions such as the World Trade Organization, the International Monetary Fund, and the World Bank. Initially sustained by underground newspapers, zines, and radical (often anarchist and/or feminist) publishers and info shops, the movement also benefited from widespread adoption of the Internet, which resulted in a flourishing of both digital and analog activist media projects around the world. Most notable was the Independent Media Center, or Indymedia, a network of activist journalist collectives launched in 1999. Originating in London and Sydney, the early 2000s saw the rise of networked local collectives in cities and college towns around the world—staffed by volunteers and not for profit, the Indymedia network covered protests around the globe and amplified the local impacts of corporate globalization. By the middle aughts, the Indymedia network included more than 150 collectives across the Americas, Western Europe, and Oceania.

While Indymedia declined in the 2010s, its model of radical participatory online media evolved and persisted with the rise of social media platforms such as YouTube, Facebook, and Twitter. While not radical or alternative in their own right, activists have nevertheless used these for-profit, corporate-owned omnibus platforms to report and widely disseminate news and commentary that would have been traditionally relegated to a localized underground press or online activist sites. In 2011, the Canadian alternative magazine *Adbusters*—founded in 1989, and known for innovations in anti-consumerist culture jamming—put out a call for activists to “Occupy Wall Street,” which New York-based activists heeded that September. What became known as the Occupy movement borrowed social media reporting practices, most notably livestreaming, from

Arab Spring activists—who had leveraged online media tools to promote democracy movements throughout North Africa and the Middle East earlier that year.

While the Occupy movement dissipated under police pressure, its grassroots participatory practices of news production and circulation have become a regular feature of new social movements in the 21st century. Bolstered by widespread popular adoption of cell phones with high quality camera and video functionality, as well as high-speed mobile broadband, the Black Lives Matter movement in particular reinvigorated longstanding struggles for Black freedom and against police brutality by documenting and widely disseminating evidence of police misconduct and murder of African Americans. As such, the alternative press has become less often associated with particular mediums or outlets, but remains robust in the highly participatory practices of ideologically driven social media reporting.

News on the Right

While most predominating theories and histories of alternative news media tend to focus on outlets and practices associated with left radical and other liberatory movements, the media activists associated with the modern conservative movement or “New Right” have long viewed their work through an alternative media lens. From its earliest iterations in the early 1950s, the modern conservative movement in the United States pitted itself against a dominant “liberal media.” Understanding the mainstream news media to be biased against conservative ideas and interpretations of the news helped motivate media activists from William F. Buckley to Phyllis Schlafly to Richard Viguerie and Paul Weyrich to launch various conservative newsletters, magazines, direct mail campaigns, and even an upstart cable television channel. While more focused on commentary than reporting, these early movement-oriented right-wing media nevertheless framed the news for a growing audience of conservatives in the United States.

Initially funded by wealthy donors, by the late 1980s conservative media began showing signs of commercial viability in the United States. In 1987, the Federal Communications Commission revoked

its fairness doctrine, which since 1949 had mandated balanced coverage of politically contentious issues over the airwaves, creating space for conservative talk radio innovators such as Rush Limbaugh. Throughout the 1990s, talk radio provided a crucial alternative medium for disseminating conservative interpretations of the news of the day in a format that invited the participation of audiences, who were encouraged to call in to express their views. By 1996, Rupert Murdoch and Roger Ailes capitalized on the active conservative news audience fostered by talk radio hosts, launching the Fox News cable channel with the promise of providing the “fair and balanced” reporting that conservatives felt was missing from the mainstream media.

Talk radio and Fox News would continue to dominate the right-wing alternative media sphere in the United States, but the early 21st century saw a flourishing of alternative news sites on the right globally. In the United States, Andrew Breitbart launched Breitbart in 2007 with the goal of making it “the Huffington Post of the right,” referring to a then-popular liberal news aggregation and commentary site. Breitbart made a name for itself during the administration of U.S. President Barack Obama, breaking a series of dubiously reported stories and circulating selectively edited video clips that mixed culture jamming tactics with investigative reporting aesthetics. The site would shift further rightward upon the death of its founder in 2012, and under the leadership of Steve Bannon it played a leading role in promoting the Republican candidacy of Donald Trump for U.S. president in 2016. As of 2020, it remained among the most influential of an array of online conservative news ventures, including the Daily Caller, the *Washington Examiner*, the Washington Free Beacon, and TheBlaze, among others. Similar sites have also emerged across the globe, stoking resurgent right-wing nationalist movements throughout Europe as well as in Brazil and India. Sites such as Fria Tider in Sweden, *Junge Freiheit* in Germany, and Réinformation TV in France have provided alternative news sources for right-wing audiences frustrated by putative left bias in mainstream outlets. Like their left counterparts, right-wing activists have also taken to social media platforms, linking and sharing original content on omnibus platforms such as Facebook, YouTube,

and Twitter, as well as more niche discussion boards like 4chan and 8chan.

While conservative direct mail pioneer and magazine publisher Richard Viguerie has long framed conservative media activism in the United States as “alternative media,” scholars have been slow to employ alternative media frameworks for explaining right-wing media. By 2019 that had changed, with scholars calling for more robust and interdisciplinary inquiries into the dynamics of “conservative news cultures,” resulting from consistent patterns of meaning making that emerge between and among the sites of production, circulation, and consumption of conservative news in the United States, and more attention to the transnational similarities in how right-wing alternative media mobilize nationalist politics.

By 2020, high-choice media environments, combined with political economic headwinds facing mainstream news outlets, have increased the salience of alternative media around the world, while simultaneously disrupting the alternative/mainstream binary that has traditionally lent it conceptual utility. Some scholars have suggested “hyperpartisan news” as a conceptual replacement for “alternative news media,” but it remains to be seen whether it will attract the same degree of scholarly and activist buy in.

ALUMNI MAGAZINES

Alumni magazines are magazines produced by colleges and universities for their largest constituencies. These publications have always done the work of journalism; they document, interpret, and contextualize changes on campuses and, in many ways, in the larger society.

In 1991, Ceil Cleveland wrote in the *Gannett Center Journal* about taking on the editorship of an alumni magazine, *Columbia College Today* at Columbia University. She was reflecting on, and

pushing back against, a formula that was adhered to in some places, but that increasingly was seeming outdated—a formula that supported unvarnished cheerleading and was built on a stream of alumni-submitted updates.

At the time Cleveland was writing, editors were beginning to approach alumni magazines with a fresh orientation. That meant not just the practice of good reporting and writing but also the embrace of the values of the academy: treating issues in depth, engaging with big ideas, and not shying away from debate.

This entry first reviews alumni magazine history. It then discusses how these magazines address issues important to the university society as well as society at large. This entry concludes by examining the future of alumni magazines.

An Alumni Magazine History

Also in 1991, another editor, Patricia Ann LaSalle, wrote a mini-history of alumni magazines for the Council for Advancement & Support of Education (CASE). At the time, LaSalle was editor of *SMU Magazine* at Southern Methodist University. She noted that alumni magazines were slow to arrive in higher education: Harvard University, the United States' first institution of higher education, was chartered in 1636; it became the first to charter an official alumni association, in 1840, and started publishing an alumni periodical in 1898, with the *Harvard Bulletin*. In 1891, Yale University began publishing a weekly alumni newspaper. Three years later, Princeton University unveiled the *Alumni Princetonian* as the Saturday edition of its student newspaper.

By the 1950s, colleges and universities were energized by postwar ambitiousness. Multimillion dollar fundraising campaigns helped provide the fuel for those ambitions. In turn, effective fundraising hinged on deepening alumni loyalty. The broad reach—all those magazines in all those mailboxes, generally several times a year—far exceeded that of the familiar alumni reunion weekends, homecomings, and programs in the regions. Through the vehicle of alumni magazines, the campus would come to alumni wherever they were in terms of geography and life cycle. The editor of *Johns Hopkins Magazine* in the 1950s, Corbin Gwaltney, was among the pioneers in resisting the traditional

parochialism of alumni magazines; he would go on to become founding editor of *The Chronicle of Higher Education*.

The emblematic events of the 1960s—demands to end the Vietnam War, equally vociferous demands for racial equity, a growing embrace among the young of their power as agents of change—often originated or found dramatic (even traumatic) expression on campus. The then-editor at Columbia, George Keller, wrote about Students for a Democratic Society in the context of Columbia; in a larger sense, he was probing the meaning of protests that were consequential far beyond one campus.

Around that time, images came to play a bigger role in storytelling for commercial magazines—and for alumni magazines as well. In 1988, Charles Michael Helmken, a longtime designer with CASE, produced a book called *Great Ideas*, which was a tribute to the growing visual sophistication of alumni magazines (and other campus publications). In the field of alumni magazines, he celebrated the use of vibrant color, fine paper, high-quality printing, and compelling photography and illustration.

The alumni magazine visuals reproduced in the volume are striking, even today. Many are magazine covers: an illustration of a two-headed woman, representing the dual roles of the “working mother,” in Radford’s magazine; a photo of a pure-white mouse against a pitch-black background, with the cover line “Immunology: Of Mice and Men,” in Emory’s magazine; the words, stacked in three lines, “Talk to/MMM/MMME, for a feature on stuttering, in Hollins’ magazine; a blank sheet of ruled paper, for a story on writers and writing, in Columbia’s magazine.

The story layouts reproduced in the volume include some eye-popping examples, along with some that are more subdued, even elegant. The mix seemed appropriate to higher education, which, after all, dedicates itself both to the very traditional act of conserving knowledge and to producing and disseminating fresh discoveries. Design in alumni magazines is itself a storytelling device, and, to make that point, the Helmken volume offers a photo series originally published in the Brown University magazine. Called *Tools of the University*, it features an empty classroom with chairs arranged, expectantly, in a circle;

hands positioned on a computer keyboard, with the hint of something on the cusp of being created; a professor taking up his position at a chalkboard, with the hint of something about to be explained; a stack of musical instruments ready to be played; and then a stack of books ready to be consulted.

Alumni Magazines Tracking the Times

Today, in an echo from the 1960s, a polarized political culture puts colleges and universities under intense scrutiny. A much-publicized Pew Survey from 2017 showed that just 37% of Republican-leaning respondents believed higher education had a positive effect on the direction of the country. Later surveys pointed in the same direction (though other reports found that Republicans and Democrats agreed on the value of a college degree). Analysts pinned those results on a range of factors—the college admissions scandal that, while affecting just a few schools, helped feed the critique that selective admissions programs favor the privileged; well-publicized incidents of controversial speakers being blocked from campus appearances, supporting the narrative of a rampaging political correctness; and rising tuition costs, contributing to the notion of campuses as elite bastions.

All of that speaks to the role of these magazines in addressing issues that pervade the campus, issues that often play out in society. Through honest exploration, the best alumni magazines build understanding of the academic enterprise and strengthen support for it as well.

In 2017, a talk by controversial political scientist Charles Murray was interrupted by demonstrations at Middlebury College. The college's alumni magazine ran a commentary from the president that helped readers grasp the tough balancing act of a campus leader. She made the case for listening to "arguments that offend us," even as she endorsed the work of advocating for "a better society" and of challenging offensive views "with better reason, better research, better logic, and better data" (DiGravio, 2017).

The *Carolina Alumni Review*, from the University of North Carolina at Chapel Hill, has documented the strange odyssey of "Silent Sam," the Confederate monument that was toppled after standing on campus for 105 years. Late in 2019,

members of the UNC System board of governors brokered a settlement with the Sons of Confederate Veterans; it would provide up to \$2.5 million to display the statue on private property. The alumni magazine did not shy away from reporting that "the Faculty Council condemned the payment, social media lit up with dissent and questions, a legal group filed suit to overturn it, and the Andrew W. Mellon Foundation said it would not go forward with an anticipated \$1.5 million grant."

When COVID-19 came to campuses, in the Spring of 2020, alumni magazines did the documenting. The Summer 2020 issue of *Johns Hopkins Magazine* offered this feature lineup: "Seeing Red," about an innovative dashboard created by Hopkins' engineers that showed how the pandemic played out in real time; "This Is Not a Drill," looking at how scientists and researchers at the university's Center for Health Security, who had long warned of the catastrophic impact of a pandemic, were using their expertise to help lessen the impact of one; "A View From Italy," providing the COVID-19-related perspective of a faculty member based in Hopkins' Italy campus; "On Writing History's First Draft," on how an undergraduate newspaper had covered the crisis through the voices of students; "Losing Touch," which charted the physical and emotional toll of COVID-19, through the experiences of a physician who fought the disease at home and on the frontlines; and "Then It All Changed," recalling how the Hopkins leadership made a series of gut-wrenching decisions around the operations of the university.

Beyond a consequential pandemic, alumni magazines routinely grapple with matters that intellectually curious readers care about—and that the academy's intellectual firepower can unpack. In its Winter 2019–2020 issue, *Notre Dame Magazine* asked "What's Wrong With Experts?" reflecting on the devaluing of the wisdom and advice of authorities. In *Harvard Magazine*, March–April 2020 issue, "Healthy Plate, Healthy Planet" talked about obesity, malnutrition, and a warming planet from the vantage point of a Harvard nutrition scholar. The Winter 2020 *Carleton College Voice's* "Character Driven" reflected on the efforts of a "multidisciplinary artist" brought to campus to help the community

explore gender, ethnicity, identity, religion, privilege, and social norms.

How do we acquire language? One answer is in the *Stanford Magazine* March 2020 story “What the Kids Are Saying These Days,” about a Stanford scholar’s work in that area. And what can one committed individual do to combat climate change? It turns out that a Yale graduate has led the charge to return to lower its carbon output—a story told in the *Yale Alumni Magazine* January/February 2020 article “The Climate in California.”

Alumni Magazine Futures

Alumni show an enduring attachment to the physical alumni magazine; in its mix of words and images, it serves as a strong reminder of the physical campus. In a monograph for CASE published in 2020, Meredith Barnett, a communications consultant, referred to a survey from the Association of Magazine Media, from 2019, showing that 73% of adults say they enjoy reading a print magazine more than reading on an electronic device. Although in the commercial world, many print publications have foundered, data indicate that for alumni magazines, print remains powerful. Barnett noted that the digital space is crowded, with tweets, alerts, and emails all vying for readers’ attention. According to a recent CASE Magazine Readership Survey—combining the surveying of 91,000 readers by 176 institutions—a quarter of readers say they are “not at all likely” to view additional alumni magazine content online. Only 10% are “very likely to.”

The survey also finds that alumni learn about the campus chiefly through alumni magazines; in the strength of their influence, the magazines, as printed products, trump email, web-based content, or word of mouth. More than 80% of the alumni surveyed said they read all or most alumni magazine issues. Seventy percent of readers say they prefer to read that content in print; 11% prefer online, and 18% want both.

Still, alumni magazines, like journalism enterprises overall, have adjusted to changes in how readers consume information. Tighter printing budgets are likely to accelerate the rethinking. Between printed issues, in its “Web Extras” category, Dartmouth’s magazine showcased stories about a young graduate’s experience hiking in

Nepal, which produced some health challenges along with some lessons in human connections; a photo series documenting an emptied-out campus during the time of COVID-19; and an archival plunge into life at Dartmouth when, during World War II, the college instituted the Navy V-12 program. As campuses were grappling with the coronavirus, the website for *LMU Magazine*, published by Loyola Marymount University in Los Angeles, featured podcasts that offered expert opinion on juveniles in detention who were at risk for COVID-19, the economic consequences of the pandemic for the region and the country, the future of U.S. relations with China, and the effectiveness of political leadership in managing a crisis.

Over time, the basic alumni magazine has become more nimble, flexible, and professional. What has not changed is that higher education is rich in storytelling potential, and that through shared stories, campuses and their constituencies are deeply connected.

AMERICAN CIVIL LIBERTIES UNION (ACLU)

The American Civil Liberties Union (ACLU) is the oldest organization in the United States dedicated to promoting civil liberties. The ACLU appears in the Supreme Court more frequently than any other nongovernmental organization. In addition to litigation, it engages in education, lobbying, and other forms of activism. The organization comprises a national office with affiliate offices in 50 states and the District of Columbia. As of 2019, it claims 1.5 million members. This entry discusses the origins of the ACLU as well as its positions with respect to radicalism, communism, and anticommunism. The entry also examines the ACLU's work related to freedom of expression and freedom of assembly.

Origins

The ACLU arose in response to the federal government's repression of pacifists, radicals, and labor unions surrounding World War I. ACLU founder Roger Nash Baldwin, a Massachusetts-born social reformer, defended the rights of conscientious objectors during the war, first through the American Union Against Militarism and then through a spinoff organization, the National Civil Liberties Bureau (NCLB). The Justice Department investigated the NCLB, tapped its phones, placed an informant in its headquarters, seized its files, questioned Baldwin, and considered indicting Baldwin and other leaders under the Espionage Act for interfering with the draft. Although no Espionage Act prosecution was brought, Baldwin refused to be inducted into the military, and in 1918–1919, he served 8 months in prison.

After the war came the Palmer Raids of 1919–1920, when incidents of public disorder—including race riots, violent strikes, and a spate of bombings—prompted the Justice Department, led by Attorney General A. Mitchell Palmer, to apprehend and deport immigrants who were suspected of harboring radical sentiments. Baldwin, out of prison and back at NCLB, considered it essential to defend the rights of radicals and the cause of civil liberties. He thought the NCLB was too closely identified with the issue of conscientious

objectors, so in 1920, he converted it into a new organization, the ACLU. Baldwin ran the ACLU from 1920 to 1950.

Radicalism, Communism, and Anticommunism

Although the ACLU prides itself on placing constitutional principle above ideology, the organization and its leadership departed from neutrality in dealing with communism, first in one direction and then in the other. Like many on the Left in the 1920s, Roger Baldwin, who characterized his views as philosophical anarchism, sympathized with the Soviet Union and spent time there. In speeches and a book, *Liberty Under the Soviets* (1928), he said that the Soviet Union should not be held to the same standard as the United States because it had no tradition of civil liberties; because its violations of civil liberties were regrettable but temporary artifacts of a transition period; and because economic liberty was the foremost concern. According to Baldwin biographer Robert C. Cottrell, it is surprising that Baldwin's double standard did not discredit his work with the ACLU. Baldwin, once again like many on the Left, became much more critical of the Soviet Union in the late 1930s, particularly after the Soviet-German nonaggression pact of 1939.

During the period of Baldwin's shift, the ACLU's guiding philosophy also changed. According to Laura Weinrib, the organization initially promoted free speech and other civil liberties not for their own sake but as tools for attaining radical political ends, particularly the empowerment of labor. Baldwin at the outset said that the ACLU would seek to advance free expression in order to advance the industrial struggle. ACLU founders believed that state authority customarily repressed labor on behalf of capital; therefore, labor could be strengthened by constraining state authority. But by the New Deal, the ACLU endorsed the use of governmental power, including labor legislation. In a 1936 publication, in fact, the ACLU declared that civil liberties were threatened less by government than by vigilantes, mobs, and other nongovernmental actors, sometimes backed (or at least not stopped) by law enforcement. The ACLU also came to value free expression for its own sake rather than for the sake of the class struggle,

which ultimately entailed the recognition of free speech for corporations.

As the ACLU moved away from its radical roots, the double standard in favor of Soviet communism became a double standard against Soviet communism. After the *American Mercury* in 1936 charged that the ACLU supported communism, the organization's board filed a libel suit against the magazine. (It would be nearly three decades before the U.S. Supreme Court applied the First Amendment to libel law, in the 1964 case *New York Times Co. v. Sullivan*.) Pursuant to an out-of-court settlement, H. L. Mencken, the editor of the *Mercury*, wrote and published a more positive article about the ACLU, but it too charged that the organization was close to communists. Meanwhile, the predecessor of the House Un-American Activities Committee, a congressional committee chaired by Rep. Martin Dies, investigated the ACLU for communist influences. Baldwin submitted an affidavit to the committee in 1939 stating that the ACLU had never elected a Communist Party member to its board or its national committee, a statement that Judy Kutulas, in her ACLU history, characterizes as a flat-out lie.

With Baldwin's backing, ACLU counsel Morris Ernst then tried to purge ACLU leadership of anyone with communist connections. In 1940, the board passed a resolution saying that communists (and others who supported totalitarianism) were ineligible for leadership positions. Board member Elizabeth Gurley Flynn, one of the founding members of the ACLU, was also a member of the Communist Party, and the board ousted her. Samuel Walker, the preeminent historian of the organization, characterizes the incident as the ACLU's major deviation from principle.

Freedom of Expression and Assembly

The ACLU has been involved in landmark cases involving church-state separation, including the Scopes Monkey Trial of 1925, and equal protection under the law, including the challenge to the internment of Japanese Americans during World War II, as well as litigation and lobbying over the rights of criminal suspects, privacy rights, women's rights, LGBTQ rights, the right to abortion, and legislative apportionment. But the organization has been best known for its work in the area

of free speech. Its first substantial victory in the Supreme Court came in the 1925 case *Gitlow v. New York*, which involved a Communist Party founder convicted in New York of advocating the overthrow of the government. Although the Supreme Court affirmed the conviction, it made a landmark doctrinal shift by asserting that the Constitution prohibits state governments, and not just the federal government, from infringing free speech.

The ACLU's most noteworthy defense of free speech arose in 1977, when a small group of neo-Nazis announced plans to march through Skokie, Illinois. A largely Jewish suburb of Chicago, Skokie was home to about a thousand survivors of the Holocaust. The city of Skokie sought to prevent the march, and the ACLU represented the Nazis in litigation against the city. The action was highly contentious within the ACLU. Thousands of members resigned or declined to renew, and the organization fell into debt. Lawyers for the city of Skokie argued that the Nazi march would provoke a breach of the peace and thus fell outside First Amendment protection. The ACLU responded that the courts could not allow those offended by the marchers' message to exercise a heckler's veto, by which the opponents of a viewpoint can preempt its expression by threatening a violent response. The courts ultimately concluded that the Nazis had a constitutional right to march through Skokie. At that point, the Nazis, reportedly after negotiating with the Justice Department, decided they would not exercise their right to march there. Instead, they demonstrated in Chicago, without incident.

On another divisive issue of free speech, the ACLU opposed an anti-pornography ordinance enacted in 1984 in Indianapolis. The ordinance was largely the handiwork of feminist legal scholar Catharine MacKinnon, who called the pornography issue "women's Skokie," and Andrea Dworkin. It defined certain forms of pornography as "the graphic sexually explicit subordination of women" and provided that victims, including women who encountered the pornography in a public place, could seek monetary damages from the producers and distributors. (As part of their campaign against pornography, some conservative Christian groups also supported the Indianapolis law, despite their opposition to most of the

feminist agenda.) The ACLU filed an amicus brief on behalf of individuals and organizations challenging the ordinance. In 1985, the U.S. Court of Appeals for the Seventh Circuit struck it down as a violation of the First Amendment. When some charged the ACLU with complicity in the subjugation of women, ACLU president Nadine Strossen responded that women were more likely to be subjugated by censorship than by pornography. The conflict briefly revived in 1997, when Gloria Steinem denounced the ACLU for celebrating a film about a pornographer's First Amendment victory, *The People vs. Larry Flynt*.

Another controversy arose when the ACLU represented alt-right activist Jason Kessler in Charlottesville, Virginia, in 2017. Kessler organized what he termed a *Unite the Right* rally to protest the city's actions to stop honoring its Confederate past—specifically, renaming Lee Park as Emancipation Park and removing a statue of General Robert E. Lee. After first granting Kessler's group a permit to demonstrate in Emancipation Park, city officials rescinded it on the ground that the demonstration was likely to be much larger than originally planned. The Virginia chapter of the ACLU represented Kessler in court, and the judge ordered the city to allow the demonstration to proceed in Emancipation Park. Demonstrators, including neo-Nazis and KKK members, squared off against counterdemonstrators, a total of about 1,500 people. Fighting broke out, and a white supremacist drove his car into a crowd of counterdemonstrators, killing one person and injuring 19. The ACLU afterward announced a change in policy: It would no longer defend those who carry guns while exercising their First Amendment rights. Two months after Charlottesville, the College of William and Mary scheduled an address on freedom of speech by the executive director of the ACLU of Virginia, Claire Guthrie Gastañaga. Students from the Black Lives Matter chapter on campus prevented her from speaking; their chants included "ACLU, you protect Hitler too."

Case Selection Guidelines

Periodically, an issue pits the ACLU against its traditional allies: some Jewish organizations over the Skokie case, some feminists over the pornography statute, and some civil rights organizations

over the Charlottesville case. ACLU leaders have defended the organization as dedicated single-mindedly to the promotion of free speech. At times, however, some have charged the organization with adopting a selective approach to free speech, particularly when the speech clashes with other constitutional values. Wendy Kaminer, a former member of the national ACLU board, has expressed this perspective in a book and a number of articles. In an article published in 2018, Kaminer reported on an internal document that had been leaked to her, titled "ACLU Case Selection Guidelines: Conflicts Between Competing Values or Priorities." This post-Charlottesville document says that the national ACLU office, in deciding whether to accept a case, will not automatically treat free speech as superior to other constitutional values; instead, it will consider, among other factors, the harm that the speech may inflict on the community where it occurs. In response to Kaminer's article, the ACLU posted the guidelines publicly and said its policy on free speech, set by its national board, remained unchanged. Nonetheless, some critics charge that under the guidelines, the ACLU probably would not take another Skokie-type case.

AMPLIFICATION

When editors decide which stories to assign, publish, and promote, that editorial judgment is a decision about what content to amplify on their broadcasts, digital platforms, or print pages. While news judgment has always driven these decisions, the concept of amplification has taken on new meaning and urgency in recent years as the information ecosystem has become increasingly digital, user-driven, and saturated with misinformation, disinformation, and polarizing content. This entry discusses the risk of amplifying misinformation or polarizing content, even when the purpose is to correct misinformation, and possible ways to avoid this amplification or to minimize harm. The entry also looks at the journalistic practices that lead to amplification and the role of social media.

In today's media context, amplification is often used to describe a negative phenomenon. Sometimes unintentionally, editors and reporters can amplify misinformation, divisive narratives from politicians, or even hate speech from fringe players or nefarious actors domestic and abroad. There are several ways this can happen. Efforts to correct misinformation can have the unintended effect of amplifying it. Journalists can uncritically report false or divisive statements from politicians or officials by simply reporting what they said without providing any context. They also might give equal weight or emphasis to both sides of a public debate even when it is clear that one side is more accurate or morally grounded.

As journalists began to better understand this phenomenon and the interplay between mainstream and social media in the 2010s and into the 2020s, scholars and media critics alike pointed to the potentially negative effects on democracy and society of the amplification of false and polarizing content. Media and misinformation experts then started to identify new techniques for journalists to avoid amplification of negative content.

Important scholarship in this field was produced by Whitney M. Phillips while she served as an assistant professor of communication and rhetorical studies at Syracuse University. In her 2019 report, "The Oxygen of Amplification," for the nonprofit Data & Society Research Institute, Phillips explored how journalists view their role in amplifying the misinformation and manipulations that have found their way into the online world during and after the 2016 election. In talking with the journalists, Phillips discovered that they were ambivalent when it came to making decisions about amplifying problematic messages like misinformation, aware of the potential harms to public discourse but also aware of the dangers of not exposing them.

Among the challenges that Phillips and other scholars have illuminated are the methods that media manipulators often use to get news organizations to publish or air falsehoods, hoaxes, and divisive narratives in order to amplify them. These bad actors often prey on mainstream media during breaking news situations, when journalists and their audiences alike are hungry for new information and when getting that information out is paramount. Sadly, mass shootings or disasters that capture the public's attention are often cases in which media manipulators seek to plant misinformation about causes or responses in mainstream media outlets.

Amplification of Misinformation in Attempts to Correct It

Another major concern is that journalists can amplify misinformation even as they attempt to debunk it. This kind of amplification can occur in several ways.

When a news organization sees a falsehood circulating among people in its coverage area, such as on social media, it might try to use its own

platform to correct the falsehood. Such false information could range from misinformation about a local issue in a community to a state-sponsored effort to stoke division and undermine trust in democracy nationwide.

Because most journalists instinctively seek to correct false information when they see it, it is logical that they would try to cover the falsehood and call out its originators and spreaders. However, it might sometimes be better to avoid reporting on the misinformation altogether, to avoid amplifying it. In fact, when a mainstream media outlet chooses not to cover something, that is itself a statement to readers that the news organization does not consider the information worthy of coverage.

To deal with the amplification conundrum, First Draft, an organization that fights disinformation, has urged journalists covering a falsehood or a hoax on social media to identify a “tipping point,” or the point at which it makes sense to report on the misinformation because it can no longer be ignored.

A classic example of a news organization applying the tipping point standard involved *The Washington Post*’s May 2019 decision to publish a story on a video that had been manipulated to make it seem as if U.S. House Speaker Nancy Pelosi was drunk or somehow otherwise impaired. The video, which had been slowed down to make it appear that Pelosi was slurring her speech, and was then posted on social media, had gotten more than a million views on Facebook before the *Post* did its story.

Factors other than reach can also play into tipping point decisions. Take, for example, the news value such a story might carry given the prominence of the players involved. When the manipulated video was circulated, Pelosi was the highest ranking Democratic officeholder in the United States, second in the line of succession for the presidency, which made a video that falsely attacked her judgment especially newsworthy. Moreover, this was also a technology story: Facebook’s refusal to take down the Pelosi video shed light on social media companies’ policies involving manipulated content or misinformation at a time when those policies were under increasing scrutiny.

Inadvertent or Difficult-to-Avoid Amplification

Journalists can also inadvertently amplify misinformation by quoting without context or correction a politician who utters a falsehood, or by presenting the falsehood and the truth with equal weight rather than giving added emphasis to the truth.

Some journalists might simply report what officials say on the theory that it is inherently news because someone in power said it. To hold these politicians accountable, that thinking goes, they must be put on the record even if what they say is not immediately called out as false. The journalists might simply assume, absent any evidence, that most readers will understand that the politician’s statement is false. They might think the notion of “fact-based” reporting supports the idea of first putting the statement out there; it is a fact that this person said this thing.

But in an accelerated news environment, in which politicians and their allies use social media to repeatedly boost their messages—sometimes false ones—online and over the air, the check on the veracity of their statements must be done instantly. Some news organizations, as a result, have taken to real-time fact-checking of major speeches such as the president’s State of the Union message or other important appearances by political leaders. They are, in effect, downplaying, or de-amplifying, the falsehood by amplifying the correction.

A number of experts in media, rhetoric, and related fields have proposed ways that journalists can avoid amplifying misinformation and polarizing narratives. In addition to knowing their tipping point, journalists can adopt strategies to ensure that they do not give equal or even disproportionately heavy weight to a falsehood in an attempt to correct it. The idea is to ensure amplification of the truth, as opposed to the falsehood.

One strategy that gained currency starting in mid-2018 came from George Lakoff, a linguist who is professor emeritus at the University of California, Berkeley. Lakoff has urged journalists correcting misinformation to put the truth first, then the falsehood, then to repeat the truth. In a 2018 interview with Lakoff, CNN’s Brian Stelter called that technique a “truth sandwich,” and that

label took hold as a way to describe the technique.

Amplification of Fringe, Polarizing, and Divisive Content

A related concern is that news organizations can inadvertently stoke divisive messages, such as provocations from extremists or hardline partisans, by either quoting them uncritically or positioning their views opposite people who take a similarly hardline stance, but on the opposing side.

Journalists often explore tensions, as Tom Rosenstiel and Bill Kovach write in their book, *The Elements of Journalism*, first published in 2001. But, the authors note, journalists often wind up reporting on the extreme sides of those tensions, as a way of showing delineation between the two sides.

This dynamic has become more pronounced as more politicians use social media as a communications tool. Those platforms encourage or even require the message to be boiled down to its essence. There is little room for nuance. By emphasizing the “sides” of an issue—and the most extreme position on each side—journalists are essentially amplifying division as opposed to exploring the motives of the parties and the complexity of the issue. This can encourage audiences to take sides, and thus does not encourage them to seek a real understanding of an issue.

The Social Media Factor

It is impossible to consider news organizations’ role in the amplification of falsehoods, disinformation, and polarizing narratives without taking into account the role of social media platforms such as Facebook, Twitter, and YouTube. The advent and growth of these platforms have eroded traditional media outlets’ control over what information the public is exposed to. Still, bad actors try to get these news organizations to amplify misinformation and disinformation, given their credibility and reach in the marketplace of ideas. Purveyors of falsehoods hope to manipulate mainstream media outlets to propel their cynical and misleading messages to the public. At the same time, mainstream news organizations also use

social media to advance their own stories and their brands.

The degree to which the public can be influenced by social media was shown most prominently in the 2016 U.S. national elections, when Facebook and (Facebook-owned) Instagram groups that were controlled by the Russian Internet Research Agency acquired hundreds of thousands of U.S. followers, according to the report of special counsel Robert Mueller, who was investigating Russian influence on the elections. Facebook itself told Congress that an estimated 126 million people may have been served content from a page associated with the Internet Research Agency. Meanwhile, a growing number of people go to social media platforms for news, according to the Pew Research Center, which reported in 2019 that 55% of U.S. adults said they get news from social media either often or sometimes, up from 47% in 2018.

The mainstream media’s entanglement with social media companies at once heightens and negates journalists’ choices about what to amplify, what to correct, and what to ignore. The relationship is symbiotic: Mainstream news outlets use social media to amplify their stories, but those same social platforms spread the kind of misinformation that mainstream media outlets feel compelled to correct. For mainstream news organizations already under financial pressure because advertising has moved to the very social platforms that have eroded their gatekeeper role, this is a paradox likely to persist for years to come.

ANCHORS, TELEVISION

Television news anchors are among the few journalists known to the public on a national scale. In addition to keeping the public informed, viewers who watch a television newscast come to feel as though they *know* the people who report the news. Of all those practicing television journalism, the struggle between the time-honored principles of print and radio journalism and the elements of television appearance, personality, emotion, and celebrity is experienced to the greatest degree by network television news anchors.

Although TV news anchors often ascend to their network posts from local stations and from jobs as correspondents and reporters, they are soon distinguished by their status as the most recognizable figureheads on the nightly network news broadcasts. TV anchors' implicit associations with "hard news" as opposed to softer news

and entertainment formats also distinguish them from such other television personalities as program hosts or commentators. Critics note that while British television reporters are referred to as *news readers* (accurately reflecting what they actually do), a marked difference exists in the way they are regarded in the United States where "anchor" and "host" are often used interchangeably.

The prestige and notoriety of American television news anchors grew steadily between the inception of the phenomenon in the 1940s and the 1980s, the decade during which they reached their apex in terms of attention and autonomy. Since then, with the influx of competition for viewers' attention from other TV news channels, including cable and satellite, as well as from online media, the power of the network television news anchor has been somewhat diluted amid the sea of available news options, but the anchors are still regarded as an institution within TV news.

Emergence of TV Anchors

The American TV news anchor role came into being after World War II. Although television began operating on a commercial basis in mid-1941, the medium had been stunted by wartime priorities and a halt in the manufacture of receivers. The earliest television newscasts were little more than radio journalists reading the news in front of a camera, sometimes accompanied by still photographs.

In 1948, NBC began a newsreel program that included film clips of news items spliced together. A year later, the program was expanded to 15 minutes and became the *Camel News Caravan*, anchored by John Cameron Swayze, and lasting until 1957. Swayze provided the introductions to, explanations of, and transitions between the film clips presented. CBS contracted with Telenews, a subsidiary of Hearst-MGM newsreel, for film, and in 1948 began a regular nightly bulletin, *CBS News with Douglas Edwards*, sponsored by General Motors. John Chancellor, anchor of *NBC Nightly News* from 1970 to 1982, is also credited with having helped define television news in these early days.

Discrepant accounts characterize early anchors as humble figures who merely read the news, yet,

at the same time, had some control over the broadcasts. Television journalists developed onscreen personas to connect with viewers by using strategies to mimic face-to-face interaction. These included the anchor looking into the camera (and thus directly into the eyes of the viewer), and speaking directly and personally to each viewer.

Dimensions of appearance and performance introduced by television brought a disjuncture in the standards that Edward R. Murrow and his followers had established for radio journalism. While print experience was prized in radio journalism, training and experience would not suffice for television as an element of showmanship became an essential trait for video journalists. An ability to communicate and connect with viewers became paramount. Until the mid-1950s, the 15-minute evening network newscasts were treated as unimportant by the networks and their anchors were similarly regarded.

As the medium's reach expanded across the country in the early 1950s, television became an important political force. President Dwight Eisenhower embraced the new medium, and Richard Nixon saved his political life with his televised "Checkers" speech. In 1952, NBC's morning news and talk program debuted with Dave Garroway anchoring the *Today* show. It would not have a morning news competitor until the launch of ABC's *Good Morning America* in 1975. The softer and more eclectic morning news format offered a more informal forum for showcasing the onscreen talents and versatility of Jane Pauley, Barbara Walters, Tom Brokaw, and other hosts over the years.

The introduction into the language of the new term *anchorman* took place at the 1952 political conventions in regard to Walter Cronkite, a seasoned wire service reporter who had been anchoring the local news for the CBS-owned Washington station since 1950. According to Barbara Matu-sow, author of the 1983 book *The Evening Stars*, in one of their preconvention meetings, Sig Mickelson, then head of CBS television news, and producer Don Hewitt discussed the need to have their strongest reporter holding together the coverage from the convention floor. Hewitt compared the arrangement to a relay team, where the strongest runner, who runs the final leg of the race, is called

the *anchorman*. Thus, Cronkite became sealed in history as the first and quintessential television anchor.

CNN's entry into cable television news in 1980 offered opportunities for new faces on TV news. For many ambitious young correspondents, the 1990–1991 Gulf War represented a big break. Bernard Shaw, Christiane Amanpour, Peter Arnett, and Wolf Blitzer were among the CNN correspondents who benefited from hours of wartime coverage. Shaw was a pioneering Black anchor, while Judy Woodruff, Paula Zahn, and Anderson Cooper are other well-known anchors who have been featured on CNN. Other cable news networks were founded and rose in the late 1980s and 1990s, including CNBC in 1989, MSNBC in 1996, and the Fox News Channel also in 1996. Each has featured notable anchors.

The Anchor's Role

In addition to the TV journalist who appeared on camera, many others worked to assemble the components of each news broadcast. As early as 1949, for example, Douglas Edwards was supported by a full-time CBS staff of 16 plus 14 part-timers.

With Walter Cronkite at CBS, the network anchor also assumed the title of "managing editor" of the broadcast. This was a means of allowing the TV anchor to use his news judgment to select, hone, and shape news stories in the broadcast, while alerting the news staff and viewers that the anchor was more than a face on the screen. All solo network evening news anchors to follow would also hold the dual titles of anchor and managing editor. Yet an anchor may have little to no involvement in many stories other than reading materials prepared for him or her by others.

The advent of the TV news anchor posed challenges to traditional journalistic values and routines largely because of anchor celebrity, authority, and salary. At the heart of continuing criticism is the placing of an anchor's pleasing persona and appearance over journalistic ability, the pervasive influence of market research on hiring and promotion of TV journalists, and the enormous salaries that network anchors receive.

TV Anchors Today

By 2005, most industry analysts agreed that the networks' morning news programs, which typified the hybridization of news and entertainment, were eclipsing the evening news programs in viewer popularity and thus value within their news organizations. There are a variety of reasons people watch network evening news less often today, including an increasing number of alternative news sources and altered commuting times. Younger news consumers are also less likely to get their news from evening television news programs.

Routes to entry and promotion within the TV news field have also changed over time. The generation of television reporters who came to prominence in the 1960s and 1970s often had been trained in the wire services or radio and gained experience as foreign or war correspondents or by working their way up through local station and network ranks. In contrast, the trajectory of TV journalists in the 1980s and 1990s was somewhat different. Some of these new anchors entered the field through journalism schools or by working up through the newsroom ranks, while others, such as Anderson Cooper, had a mix of broadcast experience that included news and entertainment.

Since 2010, anchor transitions at the U.S. broadcast networks have occurred more frequently, and by 2017, once again, the anchors of all three network evening news broadcasts were men. Then, in 2019, Norah O'Donnell was named anchor of the CBS *Evening News*. But their placement is no longer as significant among the proliferation of news outlets; the news anchor post has lost some of its cachet. The past decade of anchors also contained scandal. Brian Williams was removed from his post as anchor of NBC's *Nightly News* in 2015, after an internal investigation found he misreported his own role in several stories. Lester Holt replaced Williams, making him the second Black anchor on American network television news, and the first Black solo anchor of a nightly network newscast. At Fox News Channel, sexual harassment scandals involving host Bill O'Reilly and then Chairman and CEO Roger Ailes beset the company. Megyn Kelly, who made her name at Fox challenging then-presidential candidate Donald Trump in a debate prior to the

2016 election, was taken off of the *Today Show* and her own program at NBC in 2018 after making remarks on-air that were seen as racist.

Since the mid-2000s, many news organizations of all types, including television, have been producing more commentary and opinion, and niche programming. As audiences for traditional TV news broadcasts continue to decrease amid competition, there has been an increase in the blending of news and entertainment and the fluidity and transferability of individual TV personalities across formats and genres. Whereas for the first 50 years of television news, the network TV news anchors represented identification with the objective model of journalism and hard news, news anchors today may express partisan views that cater to particular audience segments. News anchor moves between soft news, or entertainment, and hard news can be traced back through the history of television news. The rise in opinionated hosts and commentators providing politically ideological views on evening TV programs, most prominently seen on cable television news, has yielded hosts who now rival—and at times surpass—news anchors as the most well-known personalities on network television. Even so, TV news anchors deliver information to people about the world around them in a visual, personal, emotional, and dramatic way that television made possible.

Notable American TV News Anchors

Tom Brokaw (1940–)

Tom Brokaw began his career in local news, and after several local news positions around the country, he moved to Washington, DC, eventually becoming NBC's White House correspondent during the Watergate era. He shifted from hosting NBC's morning *Today* show in 1983 to anchoring the network's evening newscast. He was briefly paired with Roger Mudd as coanchor in 1982–1983, and then remained the sole anchor of the broadcast until his retirement in 2004.

Connie Chung (1946–)

Connie Chung was hired by CBS during the women's movement of the early 1970s when the networks put more women on the air. By 1974, the three networks had added about a dozen

women reporters and were recruiting more. After working her way up from positions at local TV news stations to the network level, Chung was named coanchor of the *CBS Evening News* with Dan Rather in 1993. She was the second woman (after Barbara Walters) to become an anchor, but the pairing only lasted 2 years. Subsequently, Chung coanchored ABC News' *20/20* and *Connie Chung Tonight* on CNN. She is the only person (male or female) to have served as a substitute anchor for all three network nightly newscasts as well as all three network morning newscasts.

Katie Couric (1957–)

In 2006, Katie Couric moved from her post she held for 15 years as coanchor of NBC's *Today* to CBS where she anchored the *CBS Evening News with Katie Couric* until 2011. The move made her the first solo female anchor in network television evening news. Couric and NBC made the deliberate choice of calling her *Katie* from the onset of her *Today* show career, while she had previously been known as *Katherine* as a local TV reporter and as a reporter for CNN.

Walter Cronkite (1916–2009)

Walter Cronkite began as a United Press (later called *United Press International*) wire service reporter who then anchored local news for the CBS-owned Washington station in 1950. He rose to become a journalistic star with coverage of the 1952 political conventions. The first use of the term *anchorman* came at this time. From the late 1960s until his retirement in 1981, Cronkite presided over the top-rated network news program.

Two moments epitomized Cronkite's career and impact. His visibly emotional relay of the November 1963 assassination of President Kennedy's death included, according to communications researcher Barbie Zelizer (1992, p. 146) "removing his eyeglasses in a distracted fashion and forgetting to put on his suit jacket." In a sense, he shared the national shock at the event. Five years later, on his return from onsite reporting from Vietnam, he clearly expressed his opinion that the war would never be won on military grounds and that the only end was negotiation. The two-part editorial, broadcast on successive

days, was one catalyst for President Lyndon Johnson's decision to not run for reelection.

Charles Gibson (1943–)

Charles Gibson moved from hosting ABC's *Good Morning America* to solo anchoring *World News Tonight* from 2006 to 2009. He coanchored *Good Morning America* from 1987 to 1998 and 1999 to 2006. In addition, Gibson was also coanchor of *Primetime* and was a regular substitute anchor on *World News Tonight* before his permanent appointment.

Lester Holt (1959–)

Lester Holt was named first as interim anchor to replace Brian Williams in 2015, and then as permanent anchor of the *NBC Nightly News*, making him the second Black anchor on American network television news, and the first Black solo anchor of a nightly network newscast. Holt also continued anchoring *Dateline* on NBC.

Chet Huntley (1911–1974) and David Brinkley (1920–2003)

Chet Huntley and David Brinkley emerged as news stars with their coverage of the 1956 political convention coverage for NBC. Huntley had previously worked for Movietone News and then CBS radio in Los Angeles, as well as NBC TV in Los Angeles. Brinkley was a former United Press International reporter. The Huntley–Brinkley duo that dominated network news in the early and mid-1960s was created to appeal to viewers in all parts of the country, as Huntley was from the West and Brinkley hailed from the East. Their nightly *Huntley–Brinkley Report* ran on NBC until 1970.

Peter Jennings (1938–2005)

Peter Jennings was a high school dropout who transformed himself into one of the most well-known network TV anchors. In an attempt to raise its newscast from the depths of third place against Cronkite and Huntley–Brinkley, who had emerged as trailblazers from their coverage of the decades' assassinations and scandals, ABC made

Jennings, a 26-year-old former Canadian television anchor, the anchor of its evening news broadcast in 1965, making him by far the youngest national network anchor. Although the network thought his fresh and handsome looks would appeal to younger viewers, his inexperience and the strength of his competition led Jennings to seek other assignments and ABC replaced him in 1968. Jennings would later gain recognition as the first network correspondent on the scene when Palestinian terrorists murdered Israeli athletes at the 1972 Munich Olympics. He returned, substantially more seasoned, to the anchor chair in 1978. He remained at the helm of ABC's *World News Tonight* until his death from lung cancer.

**Robert MacNeil (1931–)
and Jim Lehrer (1934–2020)**

Robert MacNeil and Jim Lehrer began their television partnership in 1973 when they provided the National Public Affairs Center for Television's continuous live coverage of the Senate Watergate hearings, broadcast on PBS. Lehrer was the solo anchor for subsequent PBS coverage of the House Judiciary Committee's impeachment inquiry of Richard Nixon. Lehrer had previously been a Texas newspaper reporter. Lehrer's newspaper career led him to public television, first in Dallas, as KERA-TV's executive director of public affairs, on-air host, and editor of a nightly news program. He subsequently moved to Washington, DC, to serve as the public affairs coordinator for PBS. Canadian born MacNeil had previously reported for Reuters news agency and NBC News and for the BBC.

In October 1975, the half-hour *Robert MacNeil Report*, with Jim Lehrer as the Washington correspondent, premiered on Thirteen/WNET New York. In September 1983, Lehrer and MacNeil launched *The MacNeil/Lehrer NewsHour*. MacNeil departed the program in 1995 and Lehrer took stewardship of the program under a new title, *The NewsHour with Jim Lehrer*. In addition, Lehrer served as a moderator for 10 nationally televised debates among the candidates in the presidential elections since 1988. In 2013, Judy Woodruff and Gwen Ifill were named coanchors of the PBS *NewsHour*.

Roger Mudd (1928–2021)

Roger Mudd began his journalism career in 1953 as a reporter for the now-defunct *Richmond News-Leader* and was news director at WRNL-AM in Richmond. He also worked as a reporter for WTOP-TV in Washington. Mudd joined CBS News in 1961 and worked as a correspondent for 19 years. In 1980, Mudd moved to NBC as coanchor of the *NBC Nightly News* with Tom Brokaw (1982–1983), and coanchor of *Meet the Press*. Later, he became the primary anchor of The History Channel. From 1987 until 1992, he was an essayist and correspondent for the *McNeil-Lehrer NewsHour* on PBS. He left the program in 1992 and became a journalism professor at Princeton University.

David Muir (1973–)

David Muir replaced Diane Sawyer as anchor of ABC's *World News Tonight* in 2014. He is also coanchor of ABC News' *20/20*. Muir has been with ABC News since 2003, joining *World News Tonight* as a weekend anchor and chief substitute for Sawyer in 2011 and coanchor of *20/20* in 2013. Prior to ABC, he was at local news stations WCVB in Boston and WTVH in Syracuse.

Edward R. Murrow (1908–1965)

Edward R. Murrow made his name with radio reports during World War II. While he was more comfortable with radio, Murrow established a tradition on television as well—that of the crusading reporter—with his 1954 attack on Senator Joseph McCarthy and in reporting on the injustices committed against those accused of communist sympathies. He also introduced such techniques as the multi point radio roundup and the split screen interview. He anchored the weekly TV documentary series *See It Now* on CBS from 1951 to 1955.

Norah O'Donnell (1974–)

Norah O'Donnell became anchor of the CBS Evening News in 2019. She succeeded Jeff Glor. Previously, O'Donnell cohosted CBS *This Morning* and was a contributor to *60 Minutes*. Prior to that she served as chief White House

correspondent. Before joining CBS News, O'Donnell worked at NBC News for more than a decade, where she covered the Pentagon, Congress, and the White House. She began her career as a print reporter for *Roll Call*.

Scott Pelley (1957–)

Scott Pelley served as anchor of the CBS *Evening News* from 2011 to 2017. Pelley joined CBS as a reporter based in New York in 1989, and later served as a CBS News correspondent based in Dallas. He was named Chief White House Correspondent in 1997. He has been a correspondent for *60 Minutes* since 2004. Before joining *60 Minutes*, Pelley was a correspondent for *60 Minutes II*. Jeff Glor replaced Scott Pelley as CBS *Evening News* anchor from late 2017 until May 2019.

Dan Rather (1931–)

Dan Rather succeeded Walter Cronkite as anchor of the CBS *Evening News* in 1981. In the mid-1980s, the program was the leading evening newscast. An early groundbreaking moment for Rather was his televised exchange with President Nixon during a news conference, recounted in Rather's 1977 memoir, in which Nixon asked Rather, "Are you running for something?" and Rather replied, "No, Mr. President, are you?" This began a protracted grudge conservatives would hold toward Rather, and the first of many media tornadoes in which Rather would find himself. Among them was his 6-minute walk-out to protest that the U.S. Open Tennis tournament had cut into the *Evening News* in 1987. CBS struggled at times to manage and withstand the fallout from Rather's behavior over the years, yet stuck by him through his controversies. However, in 2006, Rather left CBS, having been unable to quell criticism brought on by a flawed broadcast report during the 2004 elections. He signed on to host a weekly news program on HDNet.

Harry Reasoner (1923–1991)

Harry Reasoner was a reporter, White House correspondent, and anchor while at CBS News from 1956 to 1970. In 1968, he became one of the original correspondents for CBS's news magazine program *60 Minutes*. In 1970, Reasoner left CBS

to become an evening news anchor for ABC, at first paired with Howard K. Smith, and later with Barbara Walters. He returned to CBS and *60 Minutes* in 1979, where he continued to work full time until 1991.

Frank Reynolds (1923–1983)

Frank Reynolds was the primary anchor of ABC's *World News Tonight*, with coanchors Peter Jennings in London and Max Robinson in Chicago, until his death in 1983. Reynolds began his career in local radio broadcasting and then local television broadcasting in Chicago for CBS and ABC affiliates. In 1965, he became the only Chicago television reporter to travel to South Vietnam to report from the battlefield. That same year, he became an ABC network correspondent in Washington. His first stint at anchoring the evening news took place in the late 1960s, ending in December 1970. For the next 8 years, he covered major stories for ABC News until he was made coanchor again in 1978.

Max Robinson (1939–1988)

Max Robinson became the first Black anchor on broadcast network television in 1981, as the Chicago-based coanchor of ABC's *World News Tonight* with Peter Jennings and Frank Reynolds. Robinson caused a stir when the press reported that, as part of a 1981 speech at Smith College, he remarked that TV networks discriminated against Black reporters and that "unconscious racism" existed at the decision-making levels in news media. Robinson then became anchor of the local news in Chicago, a reversal of the normal progression of an on-camera reporter's career.

Diane Sawyer (1945–)

Diane Sawyer was the anchor of ABC's *World News Tonight* from 2009 until 2014. She replaced Charles Gibson upon his retirement from ABC in 2009. The two previously coanchored *Good Morning America*. Sawyer joined ABC News in February 1989 as coanchor of *Primetime*. In addition to that role, she was named coanchor of *Good Morning America* in January 1999, and held the post until taking over the *World News* anchor chair. Prior to joining ABC News, Sawyer

spent 9 years at CBS News as the first female correspondent of *60 Minutes*. She also coanchored the CBS *Morning News* and was CBS News's State Department correspondent.

Bob Schieffer (1937–)

Bob Schieffer succeeded Dan Rather as anchor of the CBS *Evening News* on an interim basis in 2006 as speculation abounded as to what long-term shape the program might take. He became a contributor to the broadcast when Katie Couric was named as a permanent replacement in April 2006. Schieffer began his career with CBS News in 1969, and was anchor of the CBS *Evening News* Sunday edition from 1973 to 1976 and anchor of the Saturday edition from 1976 to 1996.

Elizabeth Vargas (1962–) and Bob Woodruff (1961–)

Elizabeth Vargas and Bob Woodruff were paired to anchor ABC's *World News Tonight* after Peter Jennings's death in 2005. ABC had scrambled to find a successor, and emerged with not one anchor, but two. This was ABC's attempt at returning to a multi-anchor format, although not by repeating the placement of one male and one female anchor side by side at a desk, but rather a tag-team format whereby one anchor reports from the desk in New York and one from assignment in the field. In 2006, Vargas thus became the first woman of Hispanic descent to achieve the network evening news anchor post. However, less than 6 months after the pairing, with Woodruff recovering from serious injuries sustained while on assignment in Iraq in January 2006, and Vargas preparing for maternity leave, ABC named Charles Gibson the sole anchor of its evening newscast.

Barbara Walters (1929–)

Barbara Walters left her job as the first female cohost of NBC's *Today* show in 1976 to become the first female coanchor of a network evening newscast, ABC's *Evening News* with Harry Reasoner, also becoming the first anchor on television to be offered a \$1 million annual salary. Her "auction" brought into question the entire issue of the anchor as celebrity. Considering that journalism

had been slow in promoting minorities and women, the fact that the first million-dollar anchor would be a woman made the announcement all the more sensational. When Walters' pairing with Reasoner ended in 1978, she continued hosting *The Barbara Walters Special*, which featured interviews with newsmakers and celebrities. Walters also cohosted the ABC news magazine show *20/20* beginning in 1979. In 1997, she became the main host and producer of the all-female ensemble-hosted morning talk show *The View* on ABC.

Brian Williams (1959–)

Williams started his journalism career at a small TV station in Kansas. After working as a reporter for a number of local East Coast stations, Williams moved to CBS in New York City. In 1993, he shifted to NBC and a year later became the network's chief White House correspondent. For 7 years beginning in 1996, he was anchor and managing editor of *The News with Brian Williams*, a nightly program on MSNBC and then on CNBC. Williams served as anchor and managing editor of the Saturday edition of NBC *Nightly News* for 6 years before becoming anchor of the weekday edition. He was named to succeed Tom Brokaw in 2004. From 2011 to 2013, Williams also hosted a news magazine program on NBC titled, "Rock Center."

Brian Williams was removed from his post as anchor of NBC's *Nightly News* amid scandal in 2015, after an internal investigation found he misreported his own role in several stories. Lester Holt replaced Williams. Williams became the host of MSNBC's political news show, *The 11th Hour with Brian Williams*. He announced in November 2021 that he would be leaving MSNBC and NBC News before the end of his contract the following month.

Judy Woodruff (1946–) and Gwen Ifill (1955–2016)

In 2013, Judy Woodruff and Gwen Ifill were named coanchors of the PBS *NewsHour* and became the first two women to coanchor a national news broadcast. After Ifill's death in 2016, Woodruff was named sole anchor. At PBS from 1983–1993, Woodruff was the chief Washington correspondent for the McNeil/Lehrer *NewsHour*. Moving to CNN in 1993, she served as anchor and senior correspondent for 12 years;

among other duties, she anchored the weekday program *Inside Politics*. She returned to the *NewsHour* in 2007. At NBC News, Woodruff was White House correspondent from 1977 to 1982.

For 1 year after that she served as NBC's Today Show chief Washington correspondent. Ifill served as moderator and managing editor of *Washington Week* and coanchor and managing editor of PBS *NewsHour* until her death in November 2016. Before coming to PBS in 1999, Ifill was chief congressional and political correspondent for NBC News, White House correspondent for *The New York Times*, and a local and national political reporter for *The Washington Post*.

ANTITRUST

Antitrust is a concept that stems out of the notion that there should be a way to promote equitable and healthy competition in the marketplace. In the United States, the first federal statute that prohibited activities that restricted interstate commerce and competition was the Sherman Antitrust Act of 1890. The act, passed during a time when many states had just passed their own antitrust laws, was broad in scope and prohibited attempts at monopolization of interstate trade or commerce. The act made such attempts a felony. Over the two decades that followed, the United States passed additional laws to ensure equitable competition and to prevent unfair trade practices. This entry reviews the Sherman Antitrust Act and then discusses several major antitrust cases involving the media.

Sherman Antitrust Act

Two key provisions of the Sherman Antitrust Act were meant to curb situations where the concentration of power interferes with trade or reduces competition. One provision applies to cartels, or attempts by companies to limit industrial output, reduce competition within their market sector, and/or manipulate market share. A second provision, which is enforced by the Department of Justice, makes attempts to monopolize any part of commerce or trade within the United States illegal. When a firm is found to be in violation of the act, the Department of Justice can serve it with an injunction to prohibit further illegal action or, in

extreme cases, the courts can order that it be dissolved.

Typically, enforcement actions under the anti-trust act are civil actions and violators may be punished by fines, but criminal penalties can be applied and may be severe. Criminal prosecutions are usually limited to intentional and clear violations of the law, such as price fixing or rigged bids. Criminal offenses may result in fines for corporations of up to \$100 million and/or imprisonment of up to 10 years. Injured private parties may sue for triple the amount of damages incurred.

During the first two decades following passage of the act, most enforcement was against labor unions. This targeted action against unions created problems for workers who needed some way to balance the bargaining power of their employers. Some scholars speculate that this was because the language of the act was fairly vague and corporations used loopholes to their advantage. But by the turn of the century, the Progressive era movement led by President William McKinley and subsequently President Theodore Roosevelt breathed new life into the trust-busting action by the government. Congress first created the Federal Trade Commission (FTC) in September 1914 and 1 month later passed the Clayton Antitrust Act, with the purpose of adding clarity and substance to the Sherman Antitrust Act. This legislation amplified or changed the Sherman antitrust law by providing greater regulatory supervision of price discrimination, corporate supervision, and mergers. It allowed the Department of Justice and the newly created FTC the ability to regulate all mergers and gives government the discretion to approve them or not.

The FTC was set up with the power to enforce U.S. civil antitrust law and promotion of consumer protection, giving it the unique dual mission to promote both consumer protection and promote competition.

The FTC protects consumers by stopping unfair, deceptive, and fraudulent practices in the marketplace. Criminal aspects of antitrust are handled by the Department of Justice, but the FTC shares jurisdiction over federal civil enforcement of the laws with the Antitrust Division of the Department of Justice. Within the FTC there are three major bureaus that oversee and carry out its regulatory responsibilities.

- *Bureau of Consumer Protection* enforces federal laws related to consumer affairs including advertising and marketing, telemarketing fraud, financial products and practices, and identity theft and protection. The bureau is also responsible for the Do Not Call Registry, which in the past few years has come under considerable scrutiny for its inability to contain robocalls.
- *Bureau of Competition* is charged with elimination and prevention of “anticompetitive” business practices. The bureau also reviews proposed mergers and investigates nonmerger practices that could include illegal agreements among businesses in the same industry, such as suppliers and commercial buyers.
- *Bureau of Economics* supports the other two bureaus by providing expert knowledge related to the state of the economy and the impacts of FTC’s legislation and operation.

Antitrust laws attempt to regulate market forces that could lead to unwanted market power. Excessive market control by one company in a particular industry is called a *monopoly*, while control of an industry by two or three companies is called an *oligopoly*. In both cases, it is possible for one or a few entities to stifle competition and innovation by controlling production within an industry (or market sector) and set prices for goods or services within that industry.

Over the past 100 years, antitrust has played a prominent role in the regulation of many aspects of the media business. In some cases, government used antitrust laws to promote competition, to maintain a level playing field among different competitors or to curtail unwanted behavior. In other cases, the government chose not to regulate in an attempt to encourage development of new industries.

Major Antitrust Cases in the Media

This section presents several examples of the government’s use of antitrust laws to regulate the media.

Associated Press

The U.S. Constitution guarantees the freedom to publish and freedom from government

interference for all, but it does not allow a cooperative association to prohibit one member of the cooperative from providing breaking news to nonmembers. During the Mexican-American War (1846–1848), five New York newspapers formed the New York Associated Press to share the cost of transmitting news from the war front. In 1892, it became the Associated Press (AP) and in 1900, it was found guilty of restraint of trade.

During the early 20th century, the cooperative grew rapidly. In 1945, the Supreme Court held that AP had been violating the Sherman Antitrust Act by prohibiting members from selling or providing news to nonmembers as well as making it very difficult for nonmember newspapers to join the AP. The resulting Court decision facilitated the growth of its main rival, United Press International.

Radio Corporation of America

The earliest days of broadcasting began when the Radio Corporation of America (RCA) was formed by General Electric (GE), Westinghouse, and the American Telegraph and Telephone Co. (AT&T). The newly formed company benefited from sharing patent and engineering expertise of all three companies, immediately gaining an advantage in the manufacture of radio sets for the newly developing field of broadcasting.

RCA also started the National Broadcasting Company (NBC) so that those who purchased radio sets would have something to listen to. Over the next 4 years, NBC developed several radio networks by stringing together radio affiliates across the United States using AT&T long-lines to make connections.

The Department of Justice began to examine the interlocking structure of this arrangement and after several years of litigation, Westinghouse and GE agreed to sell their interests in RCA, without admitting violation of the Sherman Antitrust Act. The outcome helped to establish competitive conditions for the manufacture of radio receivers. In the meantime, NBC continued to operate two radio networks, known as *NBC Red* and *NBC Blue*, simultaneously and benefited from advertising revenues.

NBC and CBS

In 1934, the Federal Communications Commission (FCC) was formed to take over the duties of the Federal Radio Commission established in 1927. It, like the FTC, is an independent regulatory commission set up to license radio and television stations and oversee telecommunications. The FCC has the power to promulgate rules that have the effect of law. Throughout the 1930s, accusations were made against both NBC and its primary rival, CBS, that the two networks engaged in anticompetitive behavior by signing talent to their own in-house talent agencies and tying station affiliates to strict, onerous contracts. These and other network–affiliate practices came under scrutiny by the FCC in 1938 to see whether rules were needed to control network tendencies toward monopoly.

During this time, NBC held tight control on the radio markets in major metropolitan areas. In most large markets like New York, Boston, and Chicago, it owned two radio stations, each affiliated with one of the two NBC radio networks. These stations were usually the most powerful stations in the market, meaning they could reach larger audiences than smaller stations.

CBS radio, the other major network, also tended to own larger stations in the market. Mutual radio, the fourth commercial network, actually had more affiliates than either NBC or CBS, but these affiliate stations were smaller and less powerful and therefore unable to compete for listeners and advertisers.

By 1941, the FCC concluded that there had been abuses by the powerful networks and ordered NBC to sell one of the two stations it owned in each of the large metro markets. It also ordered NBC to divest itself of one of the two major networks. The Supreme Court upheld the FCC decision and as a result of the NBC network breakup, the ABC network was formed.

Cross-Ownership

During this era, the FCC began to examine whether ownership of radio stations by newspapers in the same community (cross-ownership) might stifle differing voices in the community. For example, in Syracuse, NY, both the morning and

evening newspaper and the NBC radio station were owned by the same company. After World War II, when television licenses were allocated, the same company received a channel allocation, which became the NBC TV affiliate. Critics wondered whether news about local politics could be negatively impacted or whether different points of view might be stifled by such close media cross-ownership.

During the 1950s and 1960s, the FCC seemed too busy getting television and the new FM radio band underway to deal with cross-ownership issues; however, in 1970 the commission limited ownership. Television stations had to divest any radio stations they owned in the same market. The commission also began a long investigation on newspaper-broadcast station cross-ownership. In 1975, the FCC prohibited new newspaper-television combinations and required newspapers to sell their television stations when there was only one TV station in the market. These rules were developed to prevent tying advertising across platforms and to encourage diversity of voices in the community.

American Telegraph and Telephone Co.

In 1885, AT&T was established. The company quickly expanded to create a nationwide long-distance network and began to acquire local and state telephone services. By 1913, most regarded AT&T a “natural” monopoly; that is, the immense cost of creating a nationwide service to compete with it was unlikely. State public utility commissions and the FCC regulated cost and structure of AT&T under Title II of the 1934 Communications Act. During this time AT&T was barred from entering new businesses, but it developed many new communications technologies in its famed Bell Laboratories. During most of the 20th century, AT&T firmly controlled many technologies but was stifled in introducing them in the telecommunications field.

In 1982, the company settled an 8-year anti-trust suit with the Department of Justice that essentially broken up the conglomerate and allowed competition to enter a deregulated marketplace. The rapid growth of new technologies, such as cellular telephones, home computer services, the Internet, and mobile wireless services, has now merged media and wireless together.

In 2005, Bell South bought AT&T with the idea of creating new media provider of voice, web, and video services. AT&T purchased DirecTV in 2014 to give it access to the fast-growing Latin American market and in 2016, it announced plans to acquire Time-Warner Media. However, the Department of Justice informed AT&T that it would block the acquisition under the Clayton Act unless it agreed to sell either DirecTV or Turner Broadcasting (the group that included CNN). The Department of Justice claimed that vertical mergers between companies with complementary businesses would reduce competition and that the \$108 billion acquisition would substantially lessen competition in the media field because it would give AT&T excessive control over many of the cable channels and film vaults owned by Time Warner. The result would be higher prices and less innovation for the consumer. However, after a 2-year review, the U.S. Court of Appeals rejected the government’s claims and allowed the merger to proceed. Today the new AT&T owns DirecTV along with Time-Warner Media that includes HBO, CNN, TBS, and a host of cable networks. It is the world’s largest media conglomerate.

Microsoft

The FTC and Department of Justice have had a long history of litigating large, high-profile cases involving monopolistic practices, unfair competition, or deceptive advertising. They have not won all the big cases. The Microsoft case is one example. In 1994, the FTC began an inquiry into whether Microsoft was abusing its monopoly on personal computer operating systems by tying its web-browser, Internet Explorer, to its operating system and making it more difficult for competitors to load their software on the Windows platform. In a high-profile trial, the court ordered a breakup of the company. However, the court’s decision was reversed on appeal. In 2001, the Department of Justice reached a settlement with the company that required it to share its application program interfaces with third-party companies and to provide computer equipment to schools in states that had also sued the company.

Facebook

During the 2016 presidential campaign, Cambridge Analytica, a consulting company working for the Donald Trump campaign accessed data from tens of millions of Facebook users. The FTC was concerned that Facebook should have done more to prevent that breach of data and to protect user privacy. Earlier, in 2012, the FTC had sued Facebook for making misleading promises about to what extent consumers could keep their personal information private. Now, it appeared that Facebook had ignored that earlier agreement. After nearly 2 years, the FTC and Facebook reached a settlement, whereby Facebook would pay a \$5 billion penalty for violating consumer privacy and be required to make fundamental changes to its privacy policies. While the FTC touted this settlement as unprecedented, many Facebook critics claimed that the settlement was too small relative to the company's massive profits.

YouTube and Google

Privacy is a growing concern for the FTC as Americans become more reliant on media services, apps that can automate daily routines and provide new ways to communicate with friends, work from home, or explore interests and hobbies. Under a 2019 settlement with the FTC, YouTube and Google agreed to pay \$170 million for collecting data on children under 13 years of age without properly notifying parents or getting their permission before collecting and using the children's information for advertising purposes. As a result of the settlement, YouTube will be required to create a system for channels to identify their children-directed content and when implemented, viewer's information can no longer be tracked for advertising purposes.

Tech giants appear to be a growing concern for the FTC. In 2020, the FTC issued orders to major tech giants like Alphabet (Google), Apple, Amazon, Microsoft, and Facebook for information on terms and purposes of transactions and acquisitions of start-ups between 2010 and 2019.

Final Thoughts

Nearly 90 years after its passage, Supreme Court justice Thurgood Marshall dubbed the Sherman Antitrust Act the "Magna Carta" of our free

enterprise economy. By that, he meant that antitrust laws are as important to the continuance and preservation of economic freedom and the free-enterprise system as the Bill of Rights is to the protection of fundamental personal freedoms. The United States is generally considered to be the first modern economy to develop comprehensive laws to address market abuses. Today, the European Union and many countries in the Asia-Pacific region have developed similar laws. On a global scale, implementation of antitrust laws can help consumers by keeping competition high, by preventing price fixing, and by encouraging innovations.

ARTIFICIAL INTELLIGENCE AND JOURNALISM

In the fantasies of Hollywood, artificial intelligence (AI) is often portrayed in exaggerated ways. Software agents converse naturally with people. Robots navigate complex environments. People

fall in love with their AIs. And it generally makes for great entertainment. But the reality of AI is far from the idealized depictions seen in the media. Formally, *artificial intelligence* can be defined as a computer system able to perform a task normally requiring human intelligence. The current state-of-the-art in AI is typically limited to functioning in narrowly defined, well-engineered applications with lots of high-quality data. Modern AI often relies on *machine learning*, a technique that allows computers to learn patterns from data and then perform tasks based on those learned patterns. For instance, a system might use a large corpus of spoken and written material to learn the ways that patterns in speech translate to patterns in written text. Then it would be able to provide transcriptions of new spoken audio clips. In the domain of journalism, AI is changing a range of information work by helping to offload labor that typically requires mental effort by people. Rather than replacing human journalists, AI is more apt to augment them in narrow domains of work or to help them automate specific repetitive tasks. The strengths and weaknesses of AI are often complementary to those of people. Ultimately, AI is a tool that can be harnessed by journalists to enhance productivity, increase the scale, speed, and breadth of coverage by news organizations, and open up new possibilities for content adaptation, optimization, and personalization. This entry discusses editorial uses of AI as well as issues and opportunities for AI in journalism, including its limitations.

Editorial Uses of AI

AI approaches have impacted the entire news production chain, from newsgathering to content production and distribution.

Newsgathering

Newsgathering entails the identification of new stories, the monitoring of events, and the extraction of information—all things that AI can help with. For instance, a team at the Atlanta Journal Constitution newspaper used a machine-learning technique to help sift through more than 100,000 documents to help identify doctors throughout the United States who had been

accused of sexual misconduct but were still practicing medicine. The team of journalists working on the project simply would not have been able to investigate the story at the same scale without the aid of AI.

Journalists can also use data mining techniques to monitor vast amounts of dynamic data for potentially interesting story leads. At *The Washington Post*, a system called *Lead Locator* helps national politics reporters identify interesting locations they might visit for their reporting. To do so it analyzes a massive data set of every registered voter in the United States in order to identify locations with interesting demographic characteristics and political relevance. At Reuters, a system called *Tracer* ingests millions of Tweets on a daily basis and uses a variety of machine learning models to help identify and rank newsworthy events. An evaluation of the tool showed that it was able to speed up news alerts in 84% of cases.

Content Production

AI can also contribute to the efficiency and scale of content production, such as by automatically writing articles, summarizing events, or tagging content. The Associated Press (AP) has automated financial earnings reports using automation since 2014. The system takes in data and uses pre-written templates to output short descriptive articles about the earnings of thousands of companies. The Associated Press also uses AI to help tag the thousands of photos it handles every day. The technology can help identify who or what is in an image, making it more findable and usable by editors.

Another form of automated content used by news media are the various bots that populate social media platforms. These newsbots can be thought of as the social face of news AI, because they typically embody a persona that interacts in a social way with users. People can use bots to disseminate news content, monitor for information, and express opinions in new ways. For instance, the @big_cases bot monitors for and then tweets about new filings in U.S. district or Supreme courts, helping to raise visibility for news about those cases among people following the bot on Twitter.

Distribution

AI technologies also affect the distribution of news content. Some news organizations include recommendation or personalization modules on their sites to increase engagement with content. For instance, in 2019 *The New York Times* introduced a dynamically localized version of the Editor's Picks section of their homepage. The system can select different articles for users who visit the page from different locations and helped drive a 55% increase in clicks from that section. Similar technology is used by news organizations to curate content for email newsletters. Content recommendation and personalization algorithms are also used by various online information intermediaries, such as Google and Facebook, in curating news and other content for consumers.

Another dimension of content distribution relates to the comment sections that are now available on many news sites. While the comments section can be a useful space for users to exchange viewpoints and information, it can also lead to negative interactions where people attack each other and their ideas. Comment moderators can help keep the spaces clean and safe, but it is hard to cope with the volume of comments made on a daily basis. At *The Washington Post*, this led to the development of an AI tool called *Mod Bot* which helps screen comments and accelerate the comment moderation process.

Issues and Opportunities for AI in Journalism

The Limitations of AI

Despite all the potential benefits of using AI in journalism, there are many limitations as well. Thankfully, people are complementary and can often fill in the gaps when AI is not fully up to the task. A fundamental concern is that AI must rely on a quantified version of reality. If data does not exist about some event or topic, then AI cannot “know” about it. And because AI cannot necessarily choose what to measure and how to measure something, nor can it adapt those measurements over time, it is always going to be limited in the highly dynamic domain of news. Another issue is that the data that are available could be noisy, contain errors, or express biases. Particularly in

the case of biased data, an AI system could end up perpetuating a societal bias that is hidden in the data it learned from. Another limitation of AI is that it is often brittle—it lacks the flexibility to operate beyond the bounds of its design. This makes it difficult for AI to adapt to new or changing conditions. Finally, many AI systems, and particularly those reliant on machine learning, operate with a degree of statistical uncertainty in their outputs. If an AI system suggests that a news lead is 75% likely to be credible, it may be problematic for journalists to interpret and incorporate that into their reporting.

Journalistic Values

Much like any technology, AI is designed and developed by people whose values come to be reflected in the technology. AI can therefore be thought of as a medium of expression which can allow for the embedding of various journalistic values and norms, such as a focus on values such as public service, objectivity, autonomy, and ethics. For instance, in the design of content recommendation algorithms, a journalist might value some balance of diversity of content exposure together with some amount of shared, broadly relevant content that everyone sees. These types of values can drive the design and development of the technology so long as they are carefully and faithfully translated into the language of data and algorithms. This can be accomplished through a process of value-sensitive design, and by maintaining an ongoing awareness of how AI technologies may come into alignment or tension with normative journalistic goals.

Investigating AI

The use of AI and algorithmic decision-making has become pervasive throughout both private and public sectors of society, including in domains such as employment, welfare management, educational rankings, and criminal justice, among others. When these systems make mistakes or are thoughtlessly deployed, issues of justice, fairness, and legitimacy are all at stake. This has created a new opportunity for journalists to scrutinize and investigate AI systems in a process known as *algorithmic accountability reporting*. Such reporting

can take many forms, from technical auditing of the inputs and outputs of systems to illustrating the impacts of AI on individual's lives by telling individual stories. The potential negative impact of AI in society also raises important questions about journalist's own use of such technologies and suggests the need for journalists to develop such technology with care and consideration for how to balance risks and harms to society.

ARTS JOURNALISM

Arts journalism involves examining and reporting on the arts, including music, dance, theater, film, literature, visual arts, and architecture. It is a specialty in journalism that has evolved over the past few centuries. Arts journalism encompasses unbiased reporting of arts news and events but also

can include arts criticism, which claims a history reaching back to the writings of Socrates, Plato, and Aristotle.

Arts journalism takes an array of forms. These include feature stories such as personality profiles and performance or exhibit previews; business stories that cover the arts institutions' finances, public and private funding of artists and other arts workers, and policies and politics behind art; investigative work involving subjects such as mismanagement or crime in the art world; science stories about how the arts affect health or science; and articles that examine the impact of the arts on education.

The role of the arts journalist and the number of them working at various types of publications have changed over time—shaped by cultural shifts in the arts and revolutionary changes in technology. Arts journalists often have an education or other background in the arts (specifically the form they cover) as the subject requires understanding of the nuances of the art form, the artists and other cultural workers active in supporting and presenting it, and its history. They need to be able to execute core reporting skills including conducting interviews, researching, and writing. They also need to understand how arts organizations of various sizes function, both for-profit and not-for-profit. Today, they, like other journalists, also often need to have skills in several forms of media, including the use of social media.

This entry discusses the evolution of arts journalism in the United States since the 19th century, then looks in turn at coverage of architecture, dance, literature, music, theater, and visual art. The entry concludes with a discussion of institutions that offer support for, and recognition of, arts journalism.

Arts Journalism: An Evolving Canvas

Arts journalism has developed following two tracks—journalism and the arts. While journalists have always reported on the arts, specialized writing began to flourish when more news outlets brought on arts critics. The critics' work in many ways fulfilled a journalistic role of documenting history in the arts, and their work was infused with deep knowledge and passion. In addition, a

good number of critics also worked as journalists.

As the United States was developing, journalists wrote about many areas of the arts. Some work came as news through notices of what was happening in cities and towns through local press and other coverage came through academic outlets or periodicals. While some of the academic coverage was critical in nature, it contributed to the journalistic canon in that it documented history and the people involved.

Arts journalists and critics apply the principle of objectivity to much of their work, like their colleagues in other areas of journalism. Arts journalism, however, encompasses exemptions to the principle. A critic's work requires examination and assessment. Discernment also plays a role in an arts journalist's work when deciding on what artists, events, and issues to cover and at what particular moments. This particularly holds true for events outside those that denote breaking news. Also, many working in arts journalism have experience in the arts, and some have been practicing artists. Editors and audiences often regard that background as valuable expertise these arts journalists and critics bring to their work.

Like other areas of journalism, professional norms for arts journalists require them to maintain professional integrity that extends to their coverage and relationships. Most media organizations demand journalists follow conflict-of-interest policies. Arts journalists with personal or professional relationships with certain artists or entities are often required to refrain from covering them or their associated projects. If there is a vital reason to cover them, journalists must disclose any conflicts of interest. Critics are expected to embrace ideals of independence and fairness by supporting reviews with details and sound reasoning.

Growth in Arts and Arts Journalism

Throughout the 19th century, print publications in large cities, which had a more robust physical infrastructure for the arts, carried the most coverage. But as technology, including the use of train travel, rose by the century's close, this began to change. The press was growing. Art museums were opening in large cities across the country, and the number of touring performance groups,

particularly those involved in vaudeville, spread out across the country. Journalists covered this growth and its impact on communities.

As travel to Europe increased by the turn of the century, arts journalists from Europe found audiences in the United States and American journalists stationed overseas began writing about the prospering art scene across the Atlantic. Artists from both sides of the ocean began to visit the other side as well, including modern dancers from the United States who were challenging the status quo.

Progressive Era, New Technologies Create Boom

By the start of the Progressive Era in the late 19th century, newspapers had proliferated, and a consolidation of the industry took publications from private hands into corporate ones. Newspapers and magazines had more space to fill. That space existed in the news pages as well as pages dedicated to the arts. The beginning of the 20th century saw arts journalists covering a large number and diverse array of artists, from high to middlebrow culture. There was the new music form of jazz and new technologies that included the production of photographic film, the phonograph, and moving images. Meanwhile, Broadway theater, which began in the late 1800s, was blooming in New York. People had more leisure time, which increased the demand for the arts and coverage and for arts criticism.

Arts Journalism Integrated Into the Newsroom

Through World War I, the Great Depression, and World War II, arts coverage grew as opera houses opened across the country and radio and television expanded to include actors and the classical musicians. Networks often embraced these musicians as guests on programs and even as employees who led and played in network orchestras. Novelists, such as F. Scott Fitzgerald, as well as visual and film artists of the era became cultural stars. Journalists covered their work as well as their personal lives. Arts coverage also encompassed the art, music theater, and writers' projects launched by the government under the Works Progress Administration, a New Deal agency that employed people during the Great Depression.

Arts journalists became steady employees at news outlets, mostly print publications, documenting a growing arts sector and some even covering artists affected by the investigations of Joseph McCarthy and The House Un-American Activities Committee. Their work coincided with the economic boom of the postwar years—all the way through the 1965 creation of the National Endowment for the Arts by the U.S. Congress. But during these latter years, some of the commercial arts, particularly popular music and film, was creating controversy by challenging long-held social mores.

Arts News Covers New Controversies

Arts reporters had a landscape laden with stories to report in the 1980s and 1990s with the AIDS crisis, which struck a significant proportion of gay men including many artists. Also, religious conservatives began objecting to public funding of art they found offensive. Among the art conservatives found objectionable was artist Andres Serrano's photograph titled *Piss Christ* featuring a plastic crucifix in a tawny liquid the artist described as his own urine. Other debated works included those of four performance artists who had received National Endowment for the Arts grants and a solo exhibit of works by artist Robert Mapplethorpe. Reminders of that era and arguments against using tax dollars for the arts are still grist for arts journalists as federal and state politicians have proposed and even pulled funding from public coffers.

Other topics emerged or intensified nearing 2020, such as sexism, sexual abuse, racism, and discrimination as seen in arts journalists' coverage of the #MeToo and Black Lives Matter movements in theater, film, and other arenas. An example of that reporting is *The New York Times's* 2018 Pulitzer Prize-winning work that included longtime arts journalist Jodi Kantor. It covered sexual predators in Hollywood, including film producer Harvey Weinstein.

News Organization Cutbacks and New Arts Journalism Outlets

Traditional journalism earned lower revenues with the ascendancy of the digital revolution spurring a crisis in the industry. In the first two decades

of the 21st century, this forced publications to lay off staff and let go of many arts journalists first. Doug McLennan, editor in chief of *ArtsJournal*, which compiles articles about arts and culture, estimated that between 2000 and 2008 nearly 80% of arts journalists and critics were laid off. Dennis Scholl, John S. and James L. Knight Foundation's former vice president for arts, estimated that by 2011 as many as half of all local arts journalism jobs nationwide had been eliminated.

The layoffs and reduced arts coverage caused alarm. In April 2017, *American Theatre* magazine warned, "Arts journalism is fighting for its life." In Margaret Sullivan's 2020 book *Ghosting the News* about the decline of local news coverage, *The Washington Post* media columnist wrote about the important role of arts coverage to a city's cultural life and how it provides "a sense of community and of place." Shortly after the start of the COVID-19 pandemic in 2020, the layoffs of arts journalists increased as the economic fallout severely affected both journalism and the fine and performing arts industries.

Many arts journalists have gone on to establish nonprofit digital publications in their own cities. These publications include journalism and criticism. Some focus on specific art forms, while others cover the range of arts offered in their communities. One of the oldest is *San Francisco Classical Voice* founded in 1998. Some such as *Oregon Arts Watch* and *Sightlines* in Austin, Texas, work to cover the full spectrum of the arts. Performing arts-focused publications include Atlanta's *Arts Atlanta*, *Theatre Jones* in Dallas/Fort Worth, and Philadelphia's *Broad Street Review*. Publications emphasizing visual arts coverage include *Glasstire*, which covers the visual arts throughout Texas, and Atlanta's *Burnaway*. Many of these publications depend on freelance writers.

Coverage Areas in Arts Journalism

Arts journalists work covering multiple art forms or specialize in specific areas including music, dance, theater, film, literature, visual arts, and architecture. This gives the field more specific specializations, and each has its own history that includes prominent journalists covering certain genres.

Architecture

A majority of current news in newspapers and news magazines on architecture comes from business journalists. However, some publications in large cities still have arts journalists who cover architecture, including *The New York Times*, the *Chicago Tribune*, and the *San Francisco Chronicle*. More often, arts journalists cover architecture among other topics. Prominent magazines in the field include those founded in the 1890s—*Architectural Forum*, *Architectural Record*, and *Architectural Review*. *Architectural Digest*, *The Architect's Newspaper*, and *Dwell* also are known for their arts journalism.

In their coverage, these journalists include the business aspects of architecture, such as the financial investments involved in construction, as they report on the influences on and background of designers and the effect their designs have on people in their private and public lives.

Their subjects encompass those in urban and suburban areas, and beyond. They have covered the placement and height of skyscrapers, the redesigning and rerouting of expressways, the design of arts facilities, the impact of arts districts as well as gated communities, access and the amenities in public parks, among other topics. Their coverage considers the social and political implications of architecture.

Heavyweights in this area, who have not primarily been critics, but have had a lasting effect on how journalists report on architecture, include writers Jane Jacobs and Robert Caro. Jacobs worked at *Architectural Forum*, where in the 1950s she covered the outcomes of urban revitalization, which she criticized. That led to her 1961 book *The Death and Life of Great American Cities*. Caro, who began writing about urban planning and land use at *Newsday* in the 1960s, came to write *The Power Broker: Robert Moses and the Fall of New York*, which won him an award from the American Institute of Architects after its 1974 publication. The book described how Moses used his power to erect numerous highways and bridges around New York City and the consequences of that construction.

Many prominent critics also have also worked under the journalist title and shaped the field. They include Montgomery Schuyler, one of the

earliest and most prominent architectural journalists in the United States, who worked at *The New York Times* and *Architectural Record*; *The New Yorker*'s Lewis Mumford, who wrote in the 1930s and 1940s; the *San Francisco Chronicle*'s Allan Temko; Ada Louise Huxtable who wrote for *The New York Times* and *The Wall Street Journal*; the *Chicago Tribune*'s Paul Gapp; and Paul Goldberger, who wrote for *The New Yorker* before contributing to *Vanity Fair*. *Chicago Tribune* journalist/critic Blair Kamin reports regularly, even in his work that features commentary, particularly the 1998 six-part series, "Reinventing the Lakefront." This Pulitzer Prize-winning series covered problems along the city's lakefront, including the inequalities between the North Side's rich and largely white population and the South Side's Black and poor neighborhoods.

Dance

Critics along with trade magazines have strongly influenced dance journalism, which require that these journalists know the technical aspects of the craft and choreographic history. While many writers wrote about Western dance prior to the early 1830s, poet and French journalist Théophile Gautier is often recognized as the first dance writer because he covered ballet for *La Presse* in Paris.

Later in 1918, influential writer André Levinson came to France from Russia where he also had covered dance. His wide range of work included writings about ballet, covering Michel Fokine and Sergei Diaghilev who founded Ballet Russe, as well as Isadora Duncan and various indigenous forms of dance.

In early 20th century America, dance received little attention due to its sexual and feminine inferences, although at *The New York Times* associate music critic Carl Van Vechten covered ballet from 1906 to 1913. Then with the evolution of modern dance in the United States, John Martin came to the newspaper in 1927, where he wrote at length about Martha Graham and the artists associated with Ballet Russe, including George Balanchine and his cofounding of the New York City Ballet. His tenure lasted until 1962, during which time he was joined by the notable poet and critic Edwin Denby, whose work hewed rather firmly to

criticism. Denby's work influenced dance journalism particularly and is featured in his books.

With the rise of ballet and modern dance in 20th century America came an increase in dance journalism through specialty publications, most aimed at industry insiders. After *Dance Magazine* launched in 1927 as *The American Dancer*, it introduced sister publications, including *Pointe*, *Dance Spirit*, *Dance Teacher*, and others. Other publications founded by journalists/critics include *Ballet Review*, launched by *The New Yorker*'s Arlene Croce in 1965 and closed in 2020, and *Dance Chronicle*, begun in 1977 under editors George Dorris and Jack Anderson until it ceased in 2007.

From the 1960s through the early 1980s, dance, particularly ballet, embraced a wave of popularity through an injection of political events and pop culture attention often covered by journalists. Modern dance increasingly took on contemporary themes including feminism and civil rights. Against the backdrop of the Cold War, in 1961, the legendary ballet dancer Rudolf Nureyev fled the Union of Soviet Socialist Republics (USSR) for the West. Mikhail Baryshnikov defected from the Union of Soviet Socialist Republics to Canada in 1974 and again created a flurry of media coverage that extended to dance.

Today, the spotlight on dance has declined in mainstream press with arts journalists increasingly covering dance as it relates to pop culture, such as when it appears in films or on television shows such as *So You Think You Can Dance* (2005–).

Literature

Arts journalists and critics have covered literature as long as the press and books have existed. These journalists cover news, trends, and review books. In the United States, the popularity of books ensured ample coverage in newspapers; magazines including *The New Yorker*, *Vanity Fair*, *Time*, and *Newsweek*; and alternative newsweeklies such as *The Village Voice*. Some newspapers began publishing ample supplements, such as *The New York Times Book Review* (1896), which is akin to *The Times Literary Supplement* founded in the United Kingdom (1902). Publications specifically covering books, authors, and the

publishing industry also evolved, including the oldest trade publication, *Publishers Weekly*, founded in 1872, and *The New York Review of Books*, launched in 1963.

Since publishing has gone digital, more arts journalism is covering the world of literature with large outfits such as BuzzFeed, Slate, and Salon all including book sections. Also, the 21st century has ushered in publications dedicated to literature, including *The Millions*, launched in 2003 and *The Rumpus*, founded in 2009, which cultivated the career of writer Roxane Gay who went on to become a *New York Times* contributing opinion writer. Then there is *The Los Angeles Review of Books*, first published in 2012, which began by covering books in every genre and extended its mission to covering the arts.

Music

Music journalism has its roots in criticism and academic coverage of 19th century classical music and paralleled Romantic music's popularity. In the English-speaking world, *The Musical Times* and *Singing Class Circular* published in London held sway with musical producers and loyal music audiences.

In the United States, newspapers began to cover music in Horace Greeley's *New-York Tribune* in 1852 with journalist William Henry Fry's work in Europe as a foreign correspondent for a group of newspapers including the *Tribune*. Although Fry, the first music critic for a major American daily, also reported on music, his dual profession as a composer shaped his writings. Significant critics/journalists followed, particularly William James Henderson who wrote for *The New York Times* and *The Sun*, also based in New York City.

Over the following decades, music-focused magazines launched, including *Musical America* in 1897, which today reports on classical music news throughout the United States and often beyond. The rise of music recording brought *Gramophone*, established in 1923 in the United Kingdom, to cover classical recordings critically and cover news in that industry. Meanwhile, arts organizations began get into the arts journalism arena with the Metropolitan Opera Guild (a group dedicated to supporting the Metropolitan Opera and opera in general) taking on publishing

Opera News in 1936. The rise of jazz and blues brought *Downbeat* magazine founded in Chicago in 1934.

During these years, newspapers continued to report the news in music as technology helped create a larger music industry with more recordings and performances in many genres on an array of stages. The popularity of television, which also spotlighted classical music, conductors, and musicians, helped bolster that coverage.

With the explosion of rock 'n' roll music in the 1950s and 1960s came the rock journalist reporting in magazines, newspapers, and new publications later called alternative newsweeklies pioneered by New York City's *Village Voice*, founded in 1955. There, beginning the late 1960s, Robert Christgau established himself as the self-proclaimed "Dean of American Rock Critics." On the West Coast, *Rolling Stone* magazine launched in 1967 and ran the work of such journalists as its editor Ben Fong-Torres, Lester Bangs, who went on to become the editor of the Detroit-based *Creem* magazine, Greil Marcus, and Cameron Crowe.

As music mutated in subsequent decades giving rise to the proliferation of independent music, specific publications cropped up to cover it with the online magazine Pitchfork becoming a leader. Launched in 1995 in Minneapolis, Pitchfork's early journalism has been criticized for being unpolished. Pitchfork received praise, however, for its series work, such as that tackling issues of sexual assault in the music industry. Many newspapers also undertook this issue, including *Chicago Sun-Times* music critic Jim DeRogatis, who doggedly investigated the musician R. Kelly and his sexual abuse of minors for 19 years resulting in DeRogatis's 2019 book *The Case Against R. Kelly*.

Theater

Journalism covering theater extends to reviews but also includes a range of subjects including upcoming productions; profiles of playwrights, actors, and other theater-makers; technical issues; and even sexual harassment.

Theater has been an ever-present art form in the United States. Europeans brought their version to colonial America and William Shakespeare's

works were performed. The early press covered theatrical performances that were community events, particularly in larger cities that were near ports along the Atlantic.

Theater remained popular and saw increased popularity after the Civil War. In 1884, a New York theater began publishing *Playbill* magazine to include information about its shows. Decades later the *Playbill* began covering theater with feature stories about Broadway shows as the White Way prospered. By the 21st century, the *Playbill* was issuing an animated online publication that included podcasts and other features.

Through the 1900s, newspapers throughout the country, but particularly those in the heart of the country's theater scene of New York, dedicated staff to covering the art form. *The New York Times* took on a prominent role with writers that included Mel Gussow (1933–2005) and Frank Rich (1980–1993). But other New York newspapers and magazines regularly covered Broadway and other theater including the *New York Daily News*, the *New York Post*, *Time Out New York*, *The Wall Street Journal*, *The New Yorker*, *New York* magazine, and even the Long Island newspaper *Newsday*. By 2020, some arts journalists from other metropolitan dailies were still traveling to New York to report on the industry and review productions, including those from *The Washington Post* and the *Chicago Tribune*.

On the West Coast, thriving theater scenes received coverage from the *Los Angeles Times*, the *San Francisco Chronicle*, and *The Seattle Times*. Cities beyond the coastal regions of the United States also had arts journalists who covered the regional theater movement, which had brought professional theater to many communities. These journalists filled space with their reviews and a host of other stories related to theater including the work of theater productions in prisons, education, and other areas. By the 21st century, they were covering more stories about sexual harassment in some theater companies.

Stories like these were covered not just by newspapers but by alternative press, online publications, radio stations, and industry publications. One is *American Theatre* magazine, founded in 1984 by Theatre Communications Group, an organization promoting nonprofit professional theater. The print magazine that also publishes

online content covers a range of issues already mentioned. While the organization is not independent, like other journalistic institutions, the publication asserts principles of journalistic discourse.

Visual Art

The reporting and analysis inherent in academic writing, journalism, and criticism has been intertwined in coverage of visual art. Originally, art coverage encompassed sculpture and painting. In contemporary journalism, visual art also includes textiles, photography, film, graffiti or murals, mixed media works, and conceptual and performance art.

Criticism dates back to France and the writings of Denis Diderot (1713–1784) who covered art in Paris Salons and annual art exhibitions for a private newspaper called the *Correspondance Littéraire*. Diderot's work was admired by another critic, Charles Baudelaire (1821–1867) whose writing extolled the work of Eugene Delacroix and Edouard Manet.

In the United States, visual arts coverage came with art production by local artists but received a boost when museums were established in the 19th century and through early in the next century as artists' colonies took root throughout the country. Most of the early arts news and criticism came out of New York where galleries were based. One of the first art-focused periodicals was *The Crayon* (1855–1861). Another publication, *The New Path* began publication in 1863 with the goal of advancing natural art. Members of the Society for the Advancement of Truth in Art included influential art critic Clarence Cook, who wrote for the *New-York Tribune*.

After the Civil War, an economic boom led journalists and wealthier Americans to travel to Europe where they were exposed to more visual art. In Paris in April 1874, journalist Louis Leroy wrote about an exhibit of 30 new artists and coined the description "Impressionism." Art dealer Paul Durand-Ruel (1831–1922) organized shows for the artists and worked to sell their works into private collections in the United States. American arts journalists later covered Impressionism. Prominent critic Clement Greenberg, *The Partisan Review* editorial staff member (1940–1942) and art critic at *The Nation* (1942–1949), wrote about

how he viewed Claude Monet's Impressionism as a key advancement in painting.

The Armory Show of 1913 was an event that roused the journalism world to visual art. Covered extensively by the press in New York, the exhibit with nearly 1,400 works included Fauvism, Cubism, and Futurism and made its debut in the city before going to others. The exhibit's works caused an uproar reflected in the press. One famous piece was *Nude Descending a Staircase, No. 2*. by Marcel Duchamp. Journalists covered public reaction where it exhibited, and the public wrote in letters.

The event spurred wider curiosity about visual art, but the country already had specialty publications including *ARTnews*, launched in 1902. It covers the arts, curators, collectors, art dealers, museums, art houses, and other participants in the art market as well as trends internationally. *Art in America*, founded in 1913, was modeled after German academic journals and early issues covered the old masters in American collections and American folk art. The 21st century incarnation of *Art in America* focuses on art, artists, art criticism, and prevailing trends. *Artforum*, specializing in contemporary art, began publication in 1962 and includes coverage of conceptual and performance art, which rose in prominence during the era of its founding. With the 21st century has come the online for-profit magazine Hyperallergic, which has a wide breadth of coverage.

During the 20th century, major daily newspapers covered the visual arts. Among the publications regularly covering visual art and having a lot to cover in their communities are *The New Yorker*, *The New York Times*, and the *Los Angeles Times*.

A 2002 study conducted by the National Arts Journalism Program at Columbia University found at least one visual art critic working for most major general-interest news publications. In 2017, Mary Louise Schumacher, an arts and culture fellow with the Nieman Foundation for Journalism at Harvard University and former *Milwaukee Journal* art and architectural journalist/critic, published a study that found the number of visual arts journalists shrinking at a fast rate. (Schumacher was laid off from her Gannett-owned newspaper before she released the study.)

Institutions Supporting Arts Journalism

The specialized area of arts journalism has garnered a host of educational institutions and professional organizations to support those working in the field.

Universities Offering Education in Arts Journalism

Since the professionalism of journalism in 1908 with the opening of University of Missouri's School of Journalism, many journalism schools have offered arts journalism and criticism courses for undergraduates.

In 2003, Syracuse University began offering the first master's degree program in arts journalism at its S.I. Newhouse School of Public Communications. Titled the Goldring Arts Journalism program, the 1-year program gives students access to arts and journalism courses taught by writers, academics, and artists.

Since then other universities have followed. Columbia University School of Journalism, which had previously run its National Arts Journalism program for mid-career professionals for nearly 10 years before closing in 2005, began offering its students a concentration in arts and cultural journalism that same year. In 2008, the University of Southern California, Annenberg School for Communication and Journalism established its Master of Arts in Specialized Journalism for the arts and City University of New York's Craig Newmark Graduate School of Journalism opened its Arts and Culture Reporting program.

Professional Organizations and Prizes

While journalism organizations are prevalent for other specialty categories, including those covering education, environment, healthcare, science, and travel, none pertain to the arts overall. There is only the Jazz Journalists Association (1987). However, organizations exist for arts critics including the International Association of Art Critics (covering the visual arts and founded in 1950), the Music Critics Association of North America (1956), National Society of Film Critics (1966), the American Theatre Critics Association (1974), and the Dance Critics Association (1974). The

prestigious Pulitzer Prize has a category for critics, where the work of arts critics often is recognized.

With arts journalism falling on difficult times in the early 21st century, a few organizations have taken steps to recognize and support arts journalists. One is The Dorothea and Leo Rabkin Foundation, which began giving eight annual awards to visual arts journalists across the country in 2017. Each journalist receives \$50,000. The foundation also annually gives a lifetime achievement award to a visual arts journalist along with \$50,000.

This entry discusses the media systems in each of the five Central Asian countries. Few of these countries have been able to establish open and transparent media systems since gaining their independence. Critical reporting is frequently obstructed, with censorship rife across the region. A long tradition of political authoritarianism and centralization has led to a lack of freedom of speech and few independent journalistic outlets. However, there are some important exceptions that make generalizations about Central Asia somewhat difficult in terms of media policy and approaches. From the liberalism of Kyrgyzstan to the authoritarianism of Turkmenistan, the region defies an entirely reductive treatment, despite its outside reputation. In addition, with the continued penetration of web-based technology and the democratization associated with this, the region has gradually become more open in the post-web media environment. This evolution remains very slow and highly uneven across the region.

All Central Asian states, without exception, are highly diverse countries with sizeable minorities within them. While most are dominated by the ethnic group they take their name from, internal minorities have frequently been deemed a threat to the power of the center. The often repressive approach to the media must be seen in that context: it frequently derives from a desire to maintain centralized control. Ethnic violence has erupted at various times in most Central Asian countries over recent decades. The region is characterized by multiple ethnic and linguistic groups and a complex topography.

Uzbekistan

Uzbekistan has long had a reputation as a particularly repressive political and media environment. But in the late 2010s, the country began to allow formerly banned news services such as Voice of America, Deutsche Welle, Eurasianet, and the BBC's Uzbek service. Even more significantly, the websites of Reporters Without Borders and Amnesty International were also unblocked, in a move which seemed to indicate a new openness and approach to criticism.

Indeed, the unblocking might be viewed as a deliberate attempt to underscore a narrative of reform that the country has been keen to push to

ASIA, CENTRAL

Central Asia stretches from the Caspian Sea in the west to the border of China in the east and encompasses the five former Soviet Republics of Kyrgyzstan, Kazakhstan, Turkmenistan, Tajikistan, and Uzbekistan. Since the collapse of the Soviet Union in 1991, the region has been characterized by varying degrees of authoritarianism. Attitudes toward the practice of journalism, and media freedom more generally, in the decades since then have often been viewed by outside observers as key indicators of wider political ideologies.

the rest of the world since the death of its notoriously authoritarian president Islam Karimov in 2016. Karimov was the archetypal post-Soviet ‘strongman’, and his approach to the wider media typified the reputation that many Central Asian states had internationally since gaining their independence after the Soviet Union’s collapse.

As with most other Central Asian states, the Uzbek Constitution under Karimov paid lip service to the concept of freedom of expression—but in reality there was always a high degree of state control over media outlets and overt bans on certain topics and viewpoints. Indeed, as the “Colour Revolutions” erupted across many post-Soviet states in the 2000s, Karimov adopted a strategy of repressing activists.

Karimov even publicly argued for something he called *Eastern democracy*, suggesting that Western news values and independence of the media are not appropriate for countries where there is a “strong and enduring” respect for authority. Press freedom and individual liberty, he said, should not extend beyond what is required to achieve economic development and national security. The vehemence with which Uzbekistan was prepared to stifle media freedoms points to the potential significance of recent change. Reforms since Karimov’s death suggest that progress is possible even in the most repressive of environments across the region.

Leading Uzbek newspapers include *Khalq Sozi*, *Narodnove Solve*, and *Pravda Vostoka*—all of which are state-owned and predominately Russian-language. TV and radio are also mainly state run. There are several Uzbek news agencies, some of which publish in English.

Tajikistan

Like Uzbekistan, Tajikistan also has a poor international reputation, which has continued in recent years. At the end of the 2010s, numerous journalists on Radio Ozodi (the Tajik language service of Radio Free Europe, a crucial though controversial source of news across the region) lost their reporting credentials. This points to a wider truth about the region’s media, with semi-private outlets often coming into conflict with the authorities for their willingness to challenge official narratives.

The state itself is somewhat atypical in the region, as it is dominated by the Tajiks, who are closely related to Iranians, unlike many of the other ethnic groups within Central Asia.

Tajikistan’s newspaper landscape is a little more diverse than that of Uzbekistan, with more privately run, semi-independent titles like *Imruz News*. Most newspapers, however, are state-owned, like *Jumhuriyat* (Tajik language). There are also state-owned newspapers publishing in Russian and Uzbek, an illustration of the country’s cultural and linguistic complexity, and the government’s desire to control from the center.

Tajik TV is also generally state-controlled, with regional stations serving the markedly different north and south of the country. As with newspapers, Tajikistan’s radio stations are a little more diverse than those of Uzbekistan, although that should be viewed in relative terms, with numerous privately run stations including *Imruz* and *Vatan*.

Kazakhstan

Some have suggested that Kazakhstan and Uzbekistan began to move in opposite directions toward the end of the 2010s, with Kazakhstan—a more vibrant, albeit controlled, media environment—putting much-publicized blocks on a range of news websites. This was not the first time that the outgoing president Nursultan Nazarbayev had used illiberal tactics against media scrutiny, and in 2020 a further drive to limit access to online news sites coincided with parliamentary elections.

Quazaqstan is the Kazak state broadcaster, established in the 1950s during the Soviet era. In recent years, multiple private channels have been launched, by some measures over 100, with Channel 31 perhaps the largest and most influential. News websites are also common, a notable example being *Nur.kz*. Such sites are common across Central Asia, characteristic of a region which struggled to establish an independent print tradition postindependence.

Kyrgyzstan

In an interview with the *Daily Telegraph* in June 2012, former Kyrgyzstan President Roza Otunbayeva claimed that the overthrow of her predecessor, President Kurmanbek Bakiyev, in April

2010 acted as the catalyst for the Arab Spring that began in Tunisia later that year. Otunbayeva herself stood down in December 2011, and the revolution of 2010 was neither the first nor last political convulsion in the country since the start of the 21st century.

Her claim may not be as far-fetched as some observers believed. Global broadcaster Al Jazeera covered the 2010 Kyrgyz protests in some depth, providing wider exposure; and many of the protestors' demands were echoed later in those of protesters in the Arab world who focused on endemic corruption and lack of opportunities for the young.

As with the Arab Spring, demands also revolved around a desire for freedom of speech and a genuinely free press. While Kyrgyzstan has moved toward a free press and is held up as relatively democratic compared to its neighboring states, problems remain. Indeed, in the run-up to the highly significant 2017 election (said by many observers to be Central Asia's first peaceful handover of power between two democratically elected leaders), tensions rose and allegations of self-censorship were made.

This was not the first time that the Kyrgyz political system notched up a crucial Central Asian "first." Earlier in the decade, Otunbayeva's reign may have been short, but it was significant, because a referendum resulted in a power shift from the president to the parliament—leading numerous foreign commentators to argue that the country had become Central Asia's first parliamentary democracy. Indeed, Otunbayeva went as far as to suggest that street politics had a vital role to play in deposing corrupt and unpopular leaders.

It is, therefore, not surprising that Kyrgyzstan remains unusually "liberal" in the context of Central Asia. Equally, it is unsurprising that this makes it fundamentally unstable politically: the flip side to its "beacon of democracy" reputation is a very turbulent—at times chaotic—21st century history.

That turbulent recent history began, as with all the independent Central Asian states, with the breakup of the Soviet Union in 1991 and reached an initial climax with the Tulip Revolution of 2005, which enhanced Kyrgyzstan's reputation as a country with an appetite for democracy and

protest in the heart of a notoriously authoritarian region. As early as 1999, John Anderson had dubbed it an "island of democracy," with a developed and lively civic society informed by an independent and vibrant media.

The Tulip Revolution itself was a seminal event that echoed Georgia's Rose Revolution (2003) and Ukraine's Orange Revolution (2004) to the west, with the three brought together under the "Colour Revolutions" banner. The underlying causes were similar, in certain senses a consequence of the natural dynamics of post-Soviet life, although the cultural and economic contexts were very different—with Kyrgyzstan a poverty-stricken, nonindustrial nation at the margins of the former Soviet Union, as was the rest of Central Asia. As in Ukraine and Georgia, opponents of the revolution argued that the events were largely orchestrated by the United States, although others argue that the Tulip Revolution was actually deeply rooted in Kyrgyz domestic politics and reflected widespread discontent, not just with the political elite but also in wider society.

Although Kyrgyzstan is a rather fascinating exception to the wider media rule in Central Asia, multiple caveats apply. Firstly, the situation elsewhere in the region is becoming less straightforwardly repressive and is a more complex picture than its international reputation sometimes suggests. Secondly, Kyrgyzstan's relative liberalism masks other problems, many of which revolve around coverage of minorities and the realities of life in Central Asia, which echoes the Balkans and the Caucasus in its complex admixture of ethnic and linguistic groups.

Kyrgyz journalists cite limitations on the sizeable Uzbek minority's freedom of expression, arguing that this is particularly noticeable in terms of mainstream journalism. The owners of three Uzbek-language TV stations and two Uzbek-language newspapers all fled Kyrgyzstan following the 2010 violence in the southern city of Osh. Even here, however, there are grounds for optimism and indications of open-minded liberalism, with Uzbek-language media quickly reestablished and donor-funded websites publishing news in Uzbek.

Vecherniy Bishkek is the most well-known Kyrgyz newspaper, based in the Kyrgyz capital, with Russian-language content. Some titles publish in

Kyrgyz: *Super Info* is perhaps the most high-profile example. There is also an important English language newspaper: *The Times of Central Asia*, which—as its name suggests—covers the entire region from its Bishkek base.

Kloop is a long-standing news agency, perhaps the most important single news source in the country. Established in 2007, it has adopted a range of innovative funding strategies to ensure its continued independence, although as these have included integrated sponsored advertising, its strategy is not without controversy.

In general, Kyrgyz TV and radio stations are, as might be expected, more diverse in terms of ownership than that of other Central Asian countries. The most influential continue to be those like Kyrgyz National TV that are state-run, however. Whatever its failings, the general prognosis of Kyrgyz media remains a positive one, and in many ways the country's media environment stands as one of the world's most exceptional and interesting.

Turkmenistan

Turkmenistan is, by some measures, the world's most repressive media regime. Indeed, in 2019 empirical weight was added to this long-term accusation by the Reporters without Borders World Press Freedom Index, which placed the country at the absolute bottom of the list, relegated below North Korea for the first time. In 2020, the index ranked Turkmenistan at 179 of 180, just above North Korea.

Criticism of the President Gurbanguly Berdimuhamedov is effectively banned. The previous president, Saparmurat Niyazov, who declared himself President for Life, became a byword for the worst aspects of Central Asian political life postindependence, famously totalitarian and promoting a cult of personality that was entirely resistant to any form of media or political criticism. Numerous examples of his despotism were widely covered by the international media as an indication of the regime's excesses, foremost among them the golden statue in Ashgabat which was placed atop a 75-meter high monument and rotated to face the sun.

TV remains the most popular medium in Turkmenistan, as it is in all Central Asian countries. All

broadcasters are state-controlled, with repeats from Russian TV (for example) subject to strict censorship. There are numerous records of satellite dishes being removed from private households to prevent occupants from viewing Russian or Turkish television.

Radio Free Europe broadcasts in Turkmen under the name Radio Azatlyk. This is a crucial lifeline for some within the country, although U.S.-funded Radio Free Europe had always been a controversial feature of the post-Soviet media landscape across Central Asia. In Turkmenistan, however, the degree of state control is such that there are very few alternatives. Internet use has grown from a very low base but remains below 20% of the population. Foreign news and opposition websites are blocked, and social networks frequently censored. Both main newspapers—*Neytralnyy Turkmenistan* (published in Russian) and *Turkmenistan* (published in Turkmen)—are state-owned.

Berdimuhamedov has continued, and indeed worsened, the country's uniquely illiberal approach to media freedom. The contrast with Kyrgyzstan is stark, and goes some way to explain the caveat given earlier in this entry: Central Asia as a region is unusually difficult to generalize about in terms of media policy.

ASIA, EAST AND SOUTHEAST

Asia is the largest continent on the planet, accounting for almost 30% of the Earth's landmass and nearly 60% of the global population. It reaches as far west as portions of Europe and North Africa and extends east all the way to the Pacific Ocean. It ranges north to encompass all of Russia and south to include many island nations in the South Pacific. East and Southeast Asia are a subset of this region that are defined not only geographically, but also ethno-culturally.

East Asia comprises China, Hong Kong, Macau, Mongolia, North Korea, South Korea, Japan, and Taiwan. Southeast Asia includes Brunei, Cambodia, East Timor, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, and Vietnam.

East and Southeast Asia have a vast array of media in various types and formats. The region possesses some of the most-read newspapers in the world with daily circulations reaching more than one million copies, such as Japan's newspapers *Yomuri Shimbun* and *Asahi Shimbun*. The region has also made significant advances in the rapidly changing technologies of communication. One of South Korea's television channels, OhMyNews, is one of the first large-scale citizen journalism networks. Since the widespread use of the Internet, middle-income countries, such as Indonesia and Vietnam, have started to embrace social media platforms as a way to gain access to information.

Despite the wide array of media platforms publicly available, one distinct feature of the region's media ecologies is the lack of independent reporting, where media are constrained from providing extensive coverage of the governments. Only a few countries, such as Taiwan and East Timor, adopted the idea of independent press. In most countries in the region, governmental authorities exert power to control news media in order to prevent criticism and cover their misconduct.

The governments' control on press freedom in most East and Southeast Asian countries seemed to intensify during the coronavirus pandemic that began in December 2019. Soon after the initial cases were reported in Wuhan, Chinese officials put pressure on journalists by ordering local media to broadcast only the country's progress

and successes in containing the outbreak. Meanwhile, the governments of Thailand, Cambodia, and Myanmar took advantage of the crisis to tighten their grip on media freedom and double down on repressive actions against critics.

Government Censorship and Press Freedom

This section reviews the current state of government censorship and press freedom in various countries in the region.

East Asian State Censorship

North Korea

East and Southeast Asia may be home to countries with the strictest government censorship in the world. North Korea, for instance, remains one of the most heavily censored nations in the world. All local media in the country is run and led by the single-party government, causing the dissemination of information subjects to strict supervision.

China

Government control over the media could also be seen within its neighboring country, China. The core values of the government regime are inimical to democracy and press freedom despite constitutional provisions that say otherwise. The Chinese authorities restrict the country's media freedom using various tactics, including implementing strict monitoring of the published media content and arresting media personnel. In 2019, at least 48 journalists were imprisoned in China, more than in any other country in the world, which placed the country as the world's biggest jailer for journalists. Many of these reporters face "anti-state" charges or have been accused of producing "fake news." China has faced a progressively more restrictive media environment since Xi Jinping became president in 2013.

Mongolia

With the majority of Mongolian news organizations being affiliated with political parties, media face pressures not only from the government but also the politicians. Despite the

improving media environment over the past few years, such as the drafting of Media Freedom Law beginning in 2018, press freedom in the country is still crippled by the lack of information transparency by the government, and journalists are also pushed to conduct self-censorship, which hinders independent media reporting. While the Media Freedom Law drafting process is still underway, the law may include amendments to the government's restrictions on spreading false information. The term "false information" was not specifically defined, enabling those in power to exercise control over journalists. At least 100 reporters were charged, mostly by politicians, after a similar restriction was enacted in 2017.

Southeast Asian Autocratic States

Southeast Asian countries are still battling with journalistic freedom. Governments in several of these countries also exercise strict control over the media. Cambodia, Laos, Singapore, Thailand, and Vietnam are among the autocratic nations in the region, with governments limiting people's freedom of expression.

Cambodia

In Cambodia, the ruling Prime Minister Hun Sen and the Cambodian People's Party have put pressure on independent media, with pro-government media outlets remaining free. Media closures and the sale of a leading independent newspaper ahead of elections in 2018 meant that Cambodians only had access to news organizations linked to the prime minister. The Cambodian government regularly uses the legal system, oppressive taxation, and occasional violent attacks as methods of intimidating journalists.

Laos

The Lao People's Revolutionary Party in Laos imposes absolute restrictions on Laos media, placing the country on the 172nd of 179 nations in the 2020 World Press Freedom Index. Most of the country's media outlets are owned by the government, with some privately owned magazines only covering entertainment news without touching political topics.

Singapore

Singapore's media are highly developed and tightly controlled. There are two major players in Singapore media, Singapore Press Holdings (SPH) and Mediacorp. SPH is linked to the ruling party and has a near-monopoly of the press. Mediacorp is the national public broadcaster. The conglomerate is involved in radio, TV, and digital content. There is a reported "caste system" in the media. Frequently, SPH and Mediacorp receive government news releases hours or even days before private news outlets do. Also, the government frequently avoids requests for information on controversial issues. Newspapers occasionally publish critical content, but much self-censorship occurs and news coverage is generally pro-government.

Thailand

Similar to Laos, Thailand also experiences a tightened grip on the already-limited freedom of expression. Since the 2014 military coup, authorities have engaged in such activities as Internet surveillance and broadcast censorship. The government, including the military, holds control of almost all the national broadcast networks. The media are free to criticize government policies and cover instances of corruption and human rights abuses, but journalists tend to exercise self-censorship regarding the military, the monarchy, the judiciary, and other sensitive issues.

Vietnam

The Communist Party in Vietnam has a strong hold on the media and the state controls all print and broadcast outlets. Repressive laws constrain journalists and bloggers. Those who report or comment on controversial issues risk intimidation and physical attack. Bloggers and citizen journalists are the only sources of independent news, according to Reporters Without Borders. But they face "ever-harsher forms of persecution" (BBC News, 2018, para. 2).

Brunei

The sultan's family owns most of Brunei's media. The only television network and the primary radio channel, Radio Television Brunei, is state-owned, while the leading daily newspaper,

the Borneo Bulletin, is heavily controlled by the officials. In April 2019, the country introduced a stricter version of the existing Sharia (Islamic law) code, which includes a criminal defamation charge for bloggers and citizen journalists who publish independent-reporting information online even if the content has already been deleted after posting.

Indonesia

Indonesia has made significant improvements in its press freedom after the authoritarian leader, President Suharto, stepped down in 1998. However, the current laws and regulations are still hampering media freedom in the country. Despite claiming that they have lifted access restrictions on foreign journalists to report from Papua in 2015, the government still imposes rigorous screening and review before international media are allowed to perform their duties in the area.

Myanmar

The military coup on February 1, 2021, has caused press freedom in the country to decline rapidly. The government has exerted every effort to suppress independent reporting by raiding news media organizations, imposing Internet censorship, and arresting journalists. The military's attempt to control the flow of information included revoking press licenses of five independent news companies (Mizzima, the Democratic Voice of Burma, Myanmar Now, Khit Thit Media, and 7Day News), which had been extensively covering the protests that emerged following the February 1 coup. The crackdown could potentially revert media freedom in the country to the old system, the era before the government abolished prepublication censorship in August 2012.

Philippines

Media in the Philippines continuously face threats and attacks under the administration of President Rodrigo Duterte, placing the country as the most dangerous place for media personnel in Southeast Asia. The officials mainly target media companies and reporters who are overly critical to the government.

Press Freedoms

In East Asia, South Korea and Taiwan enjoy a higher degree of press freedom than other countries in the region.

South Korea

Media in South Korea have the capability to criticize the government and corporations with a certain degree of self-censorship. Press freedom in South Korea has been influenced by three main factors: advertisers who provide funding to news organizations, media ownership, and local press laws and ethics.

Taiwan

Despite being influenced by China, Taiwan has been considered to have the highest level of press freedom in the region.

Hong Kong

Hong Kong, a British protectorate for over 150 years, has long been a haven for materials censored in China—which became a communist country in 1947. China officially regained control of Hong Kong from the United Kingdom in 1997. This transfer was supposed to be mitigated by a 1984 agreement between China and the United Kingdom that would give Hong Kong some political and social autonomy for 50 years beyond 1997. Despite this policy, known as *one country, two systems*, China has been slowly assuming more and more control.

Macau

Macau, a Portuguese territory from 1887 to 1999, was returned to Chinese control in 1999—2 years after Hong Kong was returned to China by the British. Like Hong Kong, an agreement was made that Macau would remain partially autonomous for 50 years—until 2049. While Macau has operated for many years as another free speech zone, this may be starting to change under growing Chinese rule.

Japan

Japan's constitution guarantees press freedom in the country. However, a UN special rapporteur's

2017 report expressed concern that the government pressures journalists. Article 4 of the Broadcast Act allows the government to determine what is considered as “fair” information and which content is deemed acceptable to be broadcast, but this hinders independent news reporting. Although a recommendation to repeal the rule had been proposed, as of April 2021, it has yet to be implemented.

East Timor

Among Southeast Asia countries, East Timor (Timor-Leste) remains the highest in the rank for press freedom across the years, despite only being 20 years since its independence. In fact, a historic congress of Timor-Leste journalists held in Dili in 2013 voted in their first code of ethics, which affirmed the importance of free expression and media self-regulation.

Malaysia

Malaysia is the second highest-ranked nation in the region in terms of press freedom. The country has experienced less stringent censorship and government control of the press after the former Prime Minister Najib Razak was defeated in the 2018 general elections.

Key Events Influencing Journalism in East and Southeast Asia

In the 21st century, there have been many things that affected journalism in the region. Listed here are some of the key events.

Maguindanao Massacre

On November 23, 2009, 58 people were killed in Maguindanao, Philippines when a convoy was attacked on its way to certify a local candidate’s election status. Among those who lost their lives, 34 were journalists. In its aftermath, the Committee to Protect Journalists characterized the attack as one of the worst recorded attacks on journalists in the world. An investigation revealed that the attack was orchestrated by the Ampatuan family, who ruled the southern part of Maguindanao. A decade after the massacre, five members of the Ampatuan family clan were found guilty of murder and sentenced to life in prison.

Thailand’s 2014 Military Coup

A number of journalists were detained days after the military coup carried out by the National Peace and Order Maintaining Council on May 22, 2014, in Thailand. The military also intensified nationwide censorship and restrictions on all news media immediately after the coup. Radio and TV stations were ordered to halt their regular programs and broadcast the military’s TV channels for almost 24 hours.

Myanmar Leader Dashes Hopes for Press Freedom

Since taking power in 2015 elections that were hailed by observers as a victory for democracy and freedom of expression, the government of Aung San Suu Kyi has targeted 44 journalists with legal action—both civil and criminal cases—for their reporting. Reporters were charged under colonial-era legislation that prohibits the publication of information which “causes fear or alarm” or “disrupts public tranquillity.”

The Departure of Outspoken Japanese Anchors

Three prominent Japanese news broadcasters, Ichiro Furutachi, Hiroko Kuniya, and Shigetada Kishii, who were known for their critical commentaries to the Prime Minister Shinzo Abe, were replaced almost simultaneously in 2016. The departure was believed to be the government’s attempt to silence criticism toward the administration as the week before, the country’s internal affairs minister, Sanae Takaichi, warned news organizations of the possible suspension of broadcasting programs that do not reflect political neutrality.

Vietnam’s Force 47

In 2017, the Vietnamese government launched a cyber unit, named Force 47, in an effort to clamp down on free speech and censor online content. The cyber team consists of military officials who screen content on online platforms, particularly on the most popular social network in the country, Facebook. Their main tasks include countering online dissent and anti-regime content as

well as promoting their pro-government propaganda.

Erosion of Press Freedoms in Hong Kong and Macau

Beginning in 2014, only China-approved candidates were allowed to run in elections for Hong Kong leadership positions. This plus other punitive measures led to social unrest and a fear of a loss of press freedom in the region. For instance, since the change, journalists could be jailed or incur large fines if they reported information that resulted in vaguely defined “psychological harm” or “loss.” Reporters have been increasingly steering clear of topics that might upset the Communist Party and large corporations. Hong Kong’s national security law, passed on June 30, 2020, brought about a significant decline in the country’s media landscape. Independent news outlets began to experience the effect of the law just a month after it was enacted, including the arrest of Apple Daily’s executives, journalists’ self-censorship as a safeguard, and foreign reporters’ visa denials. Many fear that press freedom in Hong Kong will continue to erode at a rapid pace.

Similar events have been occurring in Macau. There is a growing trend of authorities to limit access to information and journalists have been expelled or denied entry. A recent survey of journalists in Macau found that they felt that press freedom still exists, but that their jobs are becoming more difficult.

Kim Jong-un Health Rumors

In the spring of 2020, many media outlets around the world speculated on the health—and even the life—of controversial North Korean leader Kim Jong Un, who had not been seen in public for some time. North Korean state media insisted he was fine. While much of the world wondered if he was gravely ill or had died, China, and perhaps more surprisingly, the South Korean government, downplayed these rumors.

The Closure of the Philippines’ ABS-CBN

Press freedom has also eroded in the Philippines under Rodrigo Duterte’s presidency. Duterte

shuts down the nation’s biggest broadcaster, ABS-CBN, in early May 2020, as an effort to silence media critics toward the government. The network reportedly triggered the president’s anger after refusing to broadcast his presidential campaign commercials in 2016 and covering controversies surrounding Duterte, including his order to kill thousands of suspected drug dealers.

Asian Media During the Global Pandemic

The recent coronavirus outbreak that impacted global society has influenced media freedom in covering the public health crisis, particularly in Asia. Asian media tend to report figures that are conveniently accessible to the public, such as the number of new cases and deaths, which could be inaccurate. A recent analysis by Reporters Without Borders showed that China is one of the countries that exercise extensive censorship in coronavirus reporting. In December, 2019, the state suppressed the initial reporting and information on the outbreak in Wuhan and claimed that the country had the spread of the virus under control. The government prohibited local news to report the circumstances in the epicenter of the outbreak in Wuhan. It also removed digital documentation and social media posts from Wuhan residents that showed their struggles in obtaining access to medical treatments. On the other hand, the heavily controlled media in the neighboring country, North Korea, reported that no coronavirus infection had been found in the country, despite bordering with China and being a primary trading partner with China (accounting for around 80% of its trade).

On the contrary, Taiwan has shown achievement in containing the outbreak through its transparency and free flow of information related to the coronavirus for the public to access. Since the outbreak began in late December 2019, the Taiwan government established the Central Epidemic Command Center in January 2020 that holds a daily press conference and utilizes social networks to circulate recent updates on the pandemic. Their independent fact-check groups, such as Taiwan FactCheck Center and MyGoPen, actively take part in correcting false information circulating online. Similar to Taiwan, South Korea’s success in

controlling the contagion is greatly influenced by the transparency of information that is available in various outlets, including local media.

Journalists in Southeast Asia countries face dilemmas when it comes to coronavirus reporting. The coronavirus that spreads across the region has prompted governments to continuously adopt new measures to contain the number of infections. These steps include establishing decrees to combat misinformation and disinformation that would potentially create public fear. Thailand authorities invoked an emergency decree in response to the outbreak on March 26, 2020, which prohibits the spread of fake news related to the coronavirus and allows public officials to censor and alter the information provided by media outlets that are deemed incorrect, with possible penalties for up to 5 years in prison for violators. On the other hand, Cambodia, under the autocratic leader Prime Minister Hun Sen, has tightened their grip on the free flow of independent news and information related to the coronavirus with more stringent surveillance and control of the media and social networks.

ASIA, SOUTH

This entry discusses the state of journalism and challenges facing the profession in eight South Asian countries: Afghanistan, Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan, and Sri Lanka. Almost 90% of the South Asian population lives in three countries—India, Pakistan, and Bangladesh. These three countries dominate the media landscape as well. The population of South Asia, around 1.95 billion, is almost 25% of the global population. Almost two thirds of the population in South Asia lives in rural areas. Much of South Asia has relatively low rates of literacy, although the literacy rate is over 90% in both Sri Lanka and Maldives.

South Asia also accounts for nearly 30% of the global population living below the poverty line. These factors (rural-urban divide, low literacy, and poverty) have contributed to low newspaper readership. However, the privately owned news television industry has been booming in these countries since 2000. Monthly cable television subscriptions compared to buying a newspaper

daily. This entry provides an overview of the news industry and challenges facing the industry and journalists in South Asia.

India is the second largest country in the world by population and has a diverse, multilingual demographic with more newspaper consumers than any other country in the world. There are around 17,500 registered newspapers and over 100,000 periodicals in India alone. About 40% of these publications are in the national language (Hindi), 12% are in English, and the remaining publications are in regional languages. India is a unique case in a world where print journalism is generally on the decline. Several new titles of newspapers and periodicals are registered in India every year and the readership numbers as well as advertising revenue have shown an upward surge in recent years. There are more than 550 FM radio stations and around 900 television channels (including nearly 400 news and current affairs television stations). There are 58 big media outlets concentrated in major metropolitan areas. They own a majority of the market share and have tie-ups with regional news outlets as well.

In Bangladesh, there are over 3,000 print publications including 1,200 daily newspapers. Circulation rose steadily beginning in the 1990s but began to decline in 2017. Radio is not as popular (around 35 operational radio stations) because television has grabbed a majority of the electronic media audience share in Bangladesh. Since 2002, the government has awarded licenses to news and entertainment televisions mostly offering 24/7 broadcasts. There are 40 television channels in Bangladesh (including 30 news channels) and their collective viewership has doubled (from 42% to 90%) in the past two decades. Outside of India and Bangladesh, the print industry (local or national newspapers and magazines) and regional journalism (catering to a local city) are not as thriving in other South Asian countries. However, the popularity of news television at the expense of print publications is consistent in all these countries. News organizations are concentrated in major metropolitan areas as well.

There were just over 600 print publications of all types in Pakistan in 2020, down from 1,820 in 2007. The electronic media have seen a mushrooming growth in Pakistan since the formation of Pakistan Electronic Media Regulatory

Authority and award of licenses to private sector in 2002. As of 2020, Pakistan has around 200 radio stations and close to 100 satellite television stations, including over 40 TV channels dedicated to news and current affairs. None of the television news stations in Pakistan, other than the state-owned PTV, air English content. Most are broadcast in the national language, Urdu.

There are 175 newspapers (including 25 dailies) in Afghanistan but the print media readership is hardly 1% of the total population. The major market share goes to 196 radio stations (73% of the population) and 95 television stations (40% of the population). The radio and television audience are primarily urban based but penetration in rural areas is increasing each year. There are more than 30 daily newspapers and a similar number of television stations in Sri Lanka. However, the news readership has declined since 2016 and the audience base is shifting toward television. Similar trends were witnessed during the 2010s in the relatively smaller media markets of Nepal, Maldives, and Bhutan.

Digital Media Platforms

Only 36% of the total population in the South Asian region is urban while the majority lives in rural areas. Because of this reason, media markets are also primarily urban-centric, and the digital divide is very much a reality. The impact of digitization in media is not as widespread in South Asia as elsewhere in the world. The relative affordability and investment in infrastructure have seen an upsurge in internet users from 2% of the region in 2004 to almost 30% in 2019. However, Internet usage is dominated by the urban and literate demographic. Afghanistan, Bangladesh, and Pakistan have the lowest Internet usage (14–16% of the population) in the region, while only one third of the population in India, Nepal, and Sri Lanka have access to Internet. The two smaller countries in the region, Bhutan (48%) and Maldives (63%), have slightly higher rates of individuals using the Internet compared to neighboring countries.

There are close to 500 million social media users in South Asian countries. However, Internet-enabled smartphones are seen as a game changer in these countries and the governments are encouraging adoption and use of smartphone

applications. Mobile Internet subscription has increased to 51% of the total Internet users in the region and the social media penetration through smartphones in the South Asian region as a whole has risen from 9% to 27% between 2015 and 2019. Almost all the countries have shown a 50% jump during the 5-year period (2014–2019) in the Mobile Internet Connectivity 2020 factsheet for South Asia.

Recognizing this trend, most mainstream news organizations have made plans to increase their online presence and also started pushing tailor-made content to smartphone users. A Reuters Institute survey of English-speaking, online news users in India in 2019 reported 68% of respondents consumed news through smartphones. India's digital advertisement market grew by over 30% in 2020. The numbers are not as high in other countries (given the smaller population compared to India) but the trends related to online news consumption and shifting revenue from traditional to online platforms are quite similar.

Ownership Structures and Censorship

In all the South Asian countries, state-owned media dominated the landscape for a long time. The governments started deregulating at the start of the 21st century, coinciding with the introduction of Internet in the region. However, licenses were primarily awarded to big conglomerates with political connections. These licenses can be withdrawn at any time by the government's regulatory agencies. Even if these new media organizations don't make profits, the political clout and access to power corridors is considered a good enough reward by the business houses. Governments also provide advertisements and other business favors to media owners.

Cross-media ownership is common and the nexus between media owners, governments, and other pressure groups has contributed to high levels of censorship in South Asian countries. Several organizations monitoring media freedom globally have provided details of the concentration of media ownership in South Asian countries and how it results in censorship practices. In Pakistan, the powerful military and intelligence agencies keep the media under control. There are several

reported cases of journalists who went missing or were tortured because their work raised questions about the government or other powerful groups. In other cases, they have been forced out of jobs.

Repression against journalists grew more severe in India after the right-wing Bharatiya Janata Party assumed power in 2014. The conglomerates that bankrolled the party's election campaigns bought stakes in big news outlets and have made sure any criticism of the ruling party is either muted or shunted out. Several influential politicians have controlling stakes in the mainstream and regional news organizations in India. The situation in Bangladesh is similar. The reelection of Sheikh Hasina Wajid as the prime minister of Bangladesh in 2018 resulted in a considerable spike in press freedom violations. Several journalists were picked up and beaten by the supporters of the ruling party and critical media outlets were barred from covering official press conferences. There has been an upsurge in state-sponsored attacks against journalists in Sri Lanka and Nepal as well. The regime changes in Maldives and Bhutan after the 2018 elections promised improvement but any tangible steps to ensure press freedom have not been taken so far.

National Security Narrative

South Asian countries have been a hotbed of regional conflicts rooted in history. Since achieving independence from Britain in 1947, India and Pakistan have fought four wars. After the 1971 war, what was then East Pakistan was carved out as a separate country (Bangladesh) on the grounds of oppression from the military regime ruling Pakistan at the time. India and Sri Lanka have been engaged in a conflict over Tamil rebels while Nepal and other smaller neighbors also have grievances with the expansionist designs of India.

Pakistan, India, and Afghanistan have regularly traded accusations of cross-border terrorism. These complex regional dynamics have made journalists vulnerable and subservient to the national security narratives in each country. The decision by India's government in August 2019 to revoke the limited autonomy of its Kashmir region resulted in a 6-month communication back out, with Internet service shutdown. The reporting on the condition of Muslims and other

minority communities in India was labelled as anti-national by several politicians and the sentiment was also echoed in a section of the mainstream media. In Pakistan, coverage of opposition parties was banned by the government in July 2019 and it remained in effect for several months. The government had to relent after the protest lodged by prominent journalist and trade unions. Still, the protests of minority groups such as Pash-tuns and Hazaras against the security forces in the restive tribal areas hardly receive any news coverage by the mainstream media. The editor of a newspaper in Bangladesh was arrested in 2019 for writing favorably about an opposition leader who was executed after being convicted of war crimes committed during Bangladesh's 1971 war of independence. Journalists are expected to follow the state narrative on national security without raising any questions. Any dissenting voice is quickly marginalized. Several journalists have lost jobs and faced threats for refusing to toe the line.

Safety Threats

South Asia is consistently ranked as one of the deadliest regions for journalists. Most countries in the region have traditionally ranked low on the press freedom indices published by international organizations. In Reporters Without Borders's 2020 World Press Freedom Index of 180 countries, 6 out of the 8 South Asian countries slid further down in the ranking compared to 2019. India was ranked 142 (two points down), Pakistan was ranked 145 (three points down), Bangladesh was ranked 151 (one point down), Afghanistan was ranked 122 (one point down), Sri Lanka was ranked 127 (one point down), and Nepal was ranked 112 (six points down). Only two smaller countries, Bhutan and Maldives, showed significant improvement in 2020 after the general elections and change of government in both countries during 2018. Bhutan was ranked 67 (13-point jump) and Maldives was ranked 79 (19-point jump).

Since the terrorist attacks of September 11, 2011, 188 journalists have lost their lives in eight South Asian countries for known causes according to a database compiled by the Committee to Protect Journalists. Almost one third of these cases, 57, were in Pakistan alone followed

by 51 in Afghanistan and 36 in India. Eighteen journalists were killed in India, 16 in Sri Lanka, 8 in Nepal, and 2 in Maldives from the period after 9/11 through 2020. Bhutan is the only country in South Asia that reported no deaths of journalists in the two decades after 9/11. In the high-profile case of *The Wall Street Journal's* Daniel Pearl, who was killed in Karachi, Pakistan, in 2002, four accused were tried. The main accused, Ahmed Omar Saeed Sheikh, was sentenced to death and three others were given a life sentence. However, the Sindh high court in April 2020 commuted the death sentence of the main accused to 7 years in prison and acquitted the remaining three on the grounds of insufficient evidence. The sentence has been appealed to the Supreme Court by the government and Pearl's family. Hearings in the case continue but the Supreme Court as well as members of the legal and media community have criticized the flawed prosecution, raising suspicions of collusion. Hardly any of the perpetrators in other cases of journalists from the region have been brought to justice even though the motive was known in all these reported cases.

The assassination of outspoken Indian journalist Gauri Lankesh in September 2017 received global coverage. She had been receiving death threats from the right-wing Hindutva militant elements. The man who allegedly pulled the trigger in Lankesh's death told the police that he did so to save his religion. Sagar Sarowar and Meherun Runi, a married journalist couple in Bangladesh, were stabbed to death in their apartment in 2012. Since July 2018, 12 people have been arrested on the suspicion of having a role in the murder and as of April 2021 the case remained under investigation. In Afghanistan, most of the 51 journalists who lost their lives, including 18 foreign journalists, were either killed in crossfire or at the hands of militant groups. Eighteen journalists were killed in 2018 at the height of peace negotiations with the Taliban in Afghanistan.

South Asian journalists continue to face oppression from state governments and other powerful groups in the discharge of their duties. The International Federation of Journalists reported 14 journalists were killed in South Asia in 2020 alone. The organization's 2019–2020 South Asia press freedom report also highlighted

at least 219 cases of attacks on media freedom during the year under scrutiny. These included 52 cases where journalists were put behind bars, 90 threats to journalists' lives, 65 nonfatal attacks, 35 attacks on media institutions, 8 gender-based attacks, and 82 cases of threats or some kind of attack on journalists from rural, regional, or minority groups.

Regulatory Frameworks

The South Asian countries have used state machinery to undermine press freedom and introduced new regulations to suit their purposes. Recognizing the importance and popularity of online platforms as mediums of expression, these governments have moved to curb freedom of expression online as well. The 2018 digital security law in Bangladesh allows any "negative propaganda" to be punishable by up to 14 years in prison. In February 2021, the government of India also announced plans to regulate all digital media platforms under the ministry of Information Technology. The Pakistani parliament passed the Prevention of Electronic Crimes Act (PECA) in 2016 that enabled the government to regulate Internet usage and censor online content in the country. Websites and online social media platforms were regularly blocked in almost all South Asian countries at various points in the 2010s. Journalists and social media users were picked up and beaten for writing social media posts against governments, security agencies, or other powerful groups. Some, including India's Jagendra Singh, Bangladesh's Mushtaq Ahmed, and Pakistan's Mashal Khan, were brutally killed. No action has been taken in any of these cases.

South Asian governments also have used social media to circulate fake news and propaganda in support of official positions. In December 2020, the EU DisinfoLab revealed a network of fake local media outlets and nongovernmental organizations that was circulating disinformation to serve the interests of India. Twitter in 2020 and Facebook in 2019 removed hundreds of fake Pakistani accounts for running propaganda campaigns for the country's security agencies. In 2020, as many as 30 news outlets called upon the Afghan government to implement the access to information law and ensure safety of journalists.

Other than Afghanistan, all other South Asian countries (Bangladesh, India, Pakistan, Sri Lanka, Nepal, Bhutan, Maldives) have access to information laws in one form or the other but these exist mainly on paper. None of these countries have taken practical steps to implement these laws for protecting independent journalism.

COVID-19 and Economic Losses

In the privately owned news organizations in South Asia, job security, training, and safety gear have never been prioritized. Internal and external pressures have made journalists in the region a vulnerable group. The COVID-19 pandemic further aggravated the situation during 2020. Press Emblem Campaign reported in April 2021 that 149 journalists had died in South Asia after getting infected by COVID-19 in the line of duty. These included 62 journalists who died in India, 48 in Bangladesh, 25 in Pakistan, 9 in Afghanistan, and 5 in Nepal. Dozens of journalists, mainly in rural India, were arrested for criticizing the government's response to the pandemic. The dip in revenues because of the adverse business climate and loss of advertising resulted in cost-cutting and job losses in almost all the South Asian media markets. More than 3,000 journalists in Pakistan and around 2,000 in India lost jobs. Mass layoffs and pay cuts or delays in paying news organizations' staff members were reported in other countries too. Several small media organizations in South Asia closed as a result of the pandemic. The impacts of the pandemic were predicted to reverberate for several years and the smaller news outlets were projected to be more adversely affected than the big players in the industry.

ASIAN AMERICAN NEWS MEDIA

Asian American journalism can be defined in two ways: through publications and electronic media that focus expressly on Asian American interests and issues and through Asian American journalists who ply their craft in any medium. This subset of journalism is rising in importance, due to the large Asian immigration influx that has taken place in the United States over recent decades. Prior to the Hart-Celler Act of 1965, a set of preferences based upon “national origins” had established quotas that limited the number of immigrants arriving from Asia. Under the new law, these restrictions were lifted, leading to a sustained growth in arrivals from that region.

According to the Migration Policy Institute, in the period from 1960 to 2017, the number of U.S. immigrants born in Asia grew from 491,000 to 13,908,000. This represented a growth from 5.0% of the U.S. immigrant population to 31.2%.

This entry describes Asian Americans working as journalists and outlines the history and current state of media intended specifically for an Asian American audience.

Asians in the United States

Asian Americans are generally defined as persons who are descendants of immigrants or who are themselves immigrants from Asia and who are also either citizens of the United States or are permanent residents. However, the term *Asian American* cloaks an enormous diversity in cultures, religions, and other aspects of social life that characterizes those who come from the Asian region. (Usually persons from the Middle East are not considered Asian Americans, even though this region is conventionally viewed as part of Asia.) Asia is the world’s largest continent and its total population exceeds that of the rest of the world combined. Hence the diversity of Asian Americans reflects the broad spectrum of immigrants originating from different countries of the continent, with their vast range of linguistic and ethnic identities.

Current estimates identify Chinese Americans and Philippine Americans as the largest groups, each at about 3.8 million, followed by Asian Indian Americans at about 2.8 million. Korean and Vietnamese immigrants and descendants each number more than 1 million.

The majority of Asian Americans reside in coastal states, and most live in major urban centers. According to the 2010 U.S. census, cities with the highest concentrations of Americans claiming Asian ethnic heritage were Honolulu, the population of which was made up of 43.9% of Asian Americans, while similar figures for Los Angeles and San Francisco were reported as 14.7% and 23.3%.

The racial prejudices that gave rise to the earlier immigration barriers have become less obvious, though critics continue to be outspoken in their complaints of persistent discrimination experienced by Asian Americans in journalism. According to a 2018 survey by the American Society of News Editors, 22.6% of newsroom staff are members of minorities, a figure that has changed little in the previous decade. This constitutes a serious concern in a nation whose ethnic diversity has

grown steadily for several decades and represents a significant disparity with the more than 35% of Americans who identify as minorities. Of these minorities, a relatively small proportion are Asian Americans. A 2019 study by the Radio Television Digital News Association found that only 2.0% of TV newsroom workers claimed Asian heritage, while radio journalists of Asian heritage amounted to 2.1%.

Development

The number of Asian Americans who have gained prominence in the news media has continued to grow despite the aforementioned barriers, and a number of these individuals have become familiar to most Americans. William Woo (1936–2006) was the first Asian American to become editor of a major U.S. newspaper when he was named to that post at the *St. Louis Post-Dispatch* in 1986. He later joined the journalism faculty at Stanford. Among other leading Asian American journalists are Nancy Yoshihara, who served in various reporting and editorial capacities for the *Los Angeles Times*; Connie Chung, who coanchored the *CBS Evening News*; John Yang, correspondent for the *PBS Newshour*; Sanjay Gupta, CNN senior medical correspondent; and Fareed Zakaria, columnist editor of *Newsweek* and CNN host.

Newspapers serving Asian Americans have been published since the mid-19th century. In 1854, immigrants from China started publication of *Kim-Shan Jit San-Luk* (Golden Hills' News) in the San Francisco area. Before 1900, a number of other publications aimed at different communities appeared as well. Because of their diverse nature, media aimed at Asian Americans tend to be segmented according to country of origin or language. For the smaller population groups, publications can be newsletters rather than broadsheets or tabloids, and some of these may appear irregularly. Newspapers for each of the major immigrant groups as well as many smaller immigrant nationalities tend to be found where populations are concentrated around the United States.

Like the rest of the newspaper industry, publications aimed at Asian Americans currently face declining circulations and rising costs, but they also are affected by changing immigration patterns. As their readers become more fully integrated into U.S.

society, newspapers must strive to remain relevant to their Asian American communities. Thus, as immigration from their host countries waxes and wanes, so does demand for their publications. An example of this trend is *Hokubei Mainichi* (North American Daily), a newspaper aimed at Japanese Americans. Published in San Francisco five times weekly, its distribution was mainly in northern California. It ceased publication in 2009, leaving only one bilingual Japanese American newspaper still operational on the West Coast. Another newspaper that ceased publication in 2009 was *AsianWeek*, a weekly aimed at readers among all Asian American communities. This tabloid enjoyed a circulation of about 60,000 when it closed, mostly in the San Francisco region where it was published. *AsianWeek* had become embroiled in controversy when in 2007 editor Kenneth Eng authored an inflammatory column titled "Why I Hate Blacks." The publisher later apologized for the column and the author was fired.

Nevertheless, many newspapers have survived, and some have thrived. Most successful Asian American newspapers do not publish daily, but rather are weekly or biweekly. For readers from the Indian subcontinent, the leading publication is *India Abroad*, which offers itself as "a window into the Indian-American world." This highly regarded weekly calls itself the largest and oldest of the South Asian American publications and has been in operation since 1970. It claims a circulation of more than 30,000, but it is also available online. Another weekly for persons of South Asian origin is the English *Lok News*. For Pakistani Americans, there is *Sada E Pakistan*, an Urdu-language weekly published in Brooklyn, New York. It focuses on metropolitan New York City but also offers national coverage of U.S. news concerning South Asia.

As noted, newspapers for Chinese Americans have had a long history in the United States, and they remain important today. Immigration from greater China has grown substantially in recent decades, and the number of Chinese Americans is almost seven times larger in 2020 than it was in 1980. The *World Journal* (*Shie Jie Yee Bao*) claims to be largest Chinese-language newspaper in the United States, with a reported daily circulation of 350,000. With headquarters in New York City, it publishes in a number of cities across the United States. It has ties to business and political interests in Taiwan.

For nearly every immigrant group, there are newspaper resources of some sort. For the Cambodian American community, there is *Nokor Thom* (Great Nation), a daily newspaper with a circulation of about 25,000, published in Long Beach, California. It was once the largest daily published in Phnom Penh but relocated to the United States after the Khmer Rouge takeover of Cambodia in the 1970s. The oldest Vietnamese language newspaper is *Nguoi Viet Daily News* (Vietnamese People Daily News) published since the mid-1970s in California. It was founded by Yen Do, who had been a war correspondent for American newspapers before Vietnamese reunification in 1975 when he immigrated to the United States. The daily currently has a circulation of 12,000 and weekly editions are published for Houston, San Francisco, Utah, and the northeastern United States. The *Korea Daily*, which promotes itself as having the largest readership among Korean Americans living in the United States, and the *Korea Times*, based in Los Angeles (not associated with *Korea Times* published in South Korea), are dailies published in a number of cities across the country.

By the end of the 1960s, a new generation of Asian American publications emerged based less on a single ethnic identity and presenting a more pan-ethnic perspective. These publications frequently presented themselves as alternative voices for all Asian Americans. The ensuing decades have continued to be politically turbulent, and many of these alternative publications have had a strong political agenda. Many have been short lived. Arising out of this period was *Amerasian Journal*. It is a scholarly publication for general subjects concerning the Asian American community and it calls itself the “leading interdisciplinary journal in Asian American Studies.” Begun at Yale University in 1971, it is now hosted by UCLA. Its contents are devoted to serious scholarship on Asian American topics, especially on historical and current issues faced by Asian Americans.

Electronic Media

In addition to print publications serving the Asian American community, electronic media are important as well, and with the rise of online media these electronic channels have proliferated. In

localities where large numbers of Asian Americans have settled, one can often find local radio broadcasts or television programs aimed at these communities. This trend has gained impetus from a growing fragmentation of broadcast audiences in the United States. As more and more radio and television stations and cable channels have opened, outlets have been forced to appeal to ever narrower audience segments.

Los Angeles leads in Asian American television audiences, with more than 700,000 viewers, followed by New York and San Francisco each with more than 600,000 and 500,000, respectively. The San Francisco area has enjoyed a comparatively large variety of Asian American media because Asian Americans make up nearly a third of the population in the city. One of the pioneers of Asian American broadcasting, Leo Chen, who has been dubbed the “father of Chinese television in America,” was based there. He used his own financial resources to purchase airtime for his program *Asia-Am TV* on San Francisco’s KEMO-TV beginning in 1973. Chen was producer and newscaster in the weekly telecasts.

Among several over-the-air television stations that provide programming for Asian Americans is KTSF in San Francisco, which makes broadcasts available throughout the Bay area. News is presented in a number of languages, including Mandarin, Cantonese, Tagalog, and Japanese. The station airs 12 hours of news each week and since 2016 has presented a morning news magazine show in Cantonese from 6:00 to 8:00 a.m. each weekday. In the Los Angeles area, KXLA labels itself as an independent ethnic broadcaster and offers television programming in Mandarin, Cantonese, and Korean. In the past, some communities have made use of public-access cable channels to provide local news programs in Asian languages. An advantage of these channels is that access to their schedules is free, or nearly so, and cable companies sometimes provide facilities and production support. In metropolitan New York City, WMBC offers programming for children in a variety of Asian languages, including Mandarin and Korean.

Even more radio stations present programming for Asian Americans. One radio station in Southern California that broadcasts to American Vietnamese audiences is KVNRR-AM in Santa Ana. It

provides music and talk shows in Vietnamese and rebroadcasts programming from Radio France International and the BBC in Vietnamese. KVNR promotes itself as Little Saigon Radio, and in addition to local transmissions, it shares its programming with stations in the San Francisco and Houston areas. Another Santa Ana station serving the Vietnamese American community is KALI-FM, and it also offers a weekday talk show in Japanese.

Asian American audiences' news habits have changed along with those of the rest of the U.S. population, and this has included a shift to online news sources. Currently, very few if any major Asian American news organizations lack an online presence. As a result, many websites for the Asian American community, though certainly not all, are extensions of existing legacy media. For instance, *World Journal* provides a very rich and deep news website in Chinese with sections devoted to the arts and sports in addition to breaking news. For some weeklies, an online website is especially important, as it allows a newspaper to maintain contact with its readership between editions.

Not all Asian American online news sources are tied to traditional print or broadcast outlets, and those that are exclusively Internet-based tend to offer alternative perspectives to those of traditional media. *AsAm News* provides news stories that link in some particular way with various Asian American communities, drawing from sources across the Web as well as their own volunteer staff. One section of the news website is titled Bad Ass Asians and hosts stories about the lives of Asian Americans, mostly focusing on their positive achievements. Another news website, *Angry Asian Man*, provides news coverage that highlights contradictions to stereotypes about Asians and Asian Americans. *Hyphen*, another online only media news source, subtitles itself as "Asian America unabridged" and has a culture emphasis with stories on the arts and literature.

Naturally, the Internet makes available to Asian Americans a wide array of culturally and linguistically diverse news sources from across the world. Many Asian Americans follow closely events in their ethnically related countries via online sources from abroad. For instance, a Thai American might follow daily events in Thailand by watching the

daily morning news show of one of the leading TV channels in Bangkok posted on YouTube.

Community

In 1981, the Asian American Journalists Association (AAJA) was formed as an organization to support Asian Americans working in the media and to encourage Asian Americans to consider careers in the news field. At the time, Asians were practically invisible in the media. This nonprofit organization has grown to become the predominant professional association for Asian Americans working in the media, and its membership numbers about 2,000. AAJA strives to support newsroom diversity and fair and accurate reportage of communities of color. The organization has more than a dozen chapters scattered across the United States, and it hosts a national annual convention. AAJA provides training for Asian American and Pacific Islander journalists so that they can promote positive change in the news field while building relationships with their communities.

The South Asian Journalists Association (SAJA) was established in New York in 1994 and today claims to serve more than 1,000 members. The organization asserts that it is not a competitor to AAJA, and many of its members belong to both. It is a volunteer organization that annually hosts a convention attended by participants numbering in the hundreds. It is an organization that serves not only Asian American journalists but also news staff who cover South Asia and the South Asian diaspora.

Research into the media preferences of Asian Americans has been somewhat limited, though the studies that are publicly available suggest, not surprisingly, differences in consumption preferences among various communities. Much as in the general U.S. population, Asian Americans tend to watch television, listen to radio, and read newspapers avidly. Asian Americans are digitally connected with 99% of their households having Internet access, as compared with 93% for U.S. Americans overall. Language appears to be a small factor in media; one report indicated that 95% of Asian Americans 35 years of age or younger speak English well, very well, or exclusively. Research has suggested that Asian Americans have a greater interest in technology than the

general population and are more likely to use social media in their daily lives. One study of Asian American women found that they often admitted to cyber dependence, though in building networks through social media were more restrictive in selecting members, possibly due to concerns about risking reputations or “saving face.”

For Asian Americans, media tend to serve broad functions: First, Asian American media help build and sustain a sense of community, without which many immigrants would simply be swept into the general population. Such media present their readers with a reassuring affirmation of their identity and cultural heritage. Second, for some Asians, media of all types provide a valuable means to acquire language proficiency. Immigrants frequently arrive with limited ability to use English, and so media, especially television, can provide daily lessons in conversational U.S. American speech. Finally, community media offer recent immigrants an opportunity to become acquainted with the everyday concerns and interests of U.S. Americans—in short, to serve as a tool of acculturation. In this sense, these media serve an important purpose not only for the community but for the larger society as well, helping provide a smooth induction for immigrants into the national mainstream.

ASSOCIATED PRESS

The Associated Press (AP), headquartered in New York City, is a nonprofit, global news organization that relies on factual newsgathering and reporting to provide news, photos, and graphics to member newspapers. Founded in 1848, the AP was the first private sector organization in the United States to operate on a national scale. Since its founding, the AP has been first to report to news consumers many of history’s most important moments, from the assassination of President Abraham Lincoln and the bombing of Pearl Harbor to the death of Pope John Paul and the 9/11 terrorism on U.S. soil. In the 21st century, the AP remains a trusted source of fast, accurate, unbiased news in all media formats and the essential provider of the technology and services that are central to news dissemination. Journalists with the AP have been recognized with numerous awards, namely 54 Pulitzer Prizes that include 32 for photography since the award was established in 1917. The AP has 248 bureaus in 99 countries relaying breaking news, covering war and conflict, and producing enterprise reports. This entry briefly traces the development of the AP, its growth over the course of the 20th century, and its evolution during the 21st century. The entry also examines the role of the associated press in election and sports polls and closes with a discussion of the AP Stylebook.

Early Development of the AP

As part of an effort to share the increased costs of the growing news competition in the early nineteenth century, cooperative newsgathering took shape in the 1820s by New York City's newspapers, which decided to split the cost of news boats to the harbor. In 1848, the city's major newspapers agreed to share the bill of chartering a steamer from Boston to meet ships from Europe at Halifax, Nova Scotia, as well as the costs associated with telegraphing the news that the steamer obtained from Boston to New York.

The telegraph, developed in 1837 when Samuel F.B. Morse applied for a patent that was granted in 1844, uses electricity to send signals over wires. The first line connected Washington, DC, and Baltimore. Operators transcribed 25 to 30 words a minute and used code to send a message, including a news dispatch. The invention contributed to the growth in the railroads and reduced information costs for firms. It also gave rise to The AP as a cooperative wire service that sends news to member newspapers. In 1846, five New York City newspapers pooled together to fund a pony express route through Alabama to deliver news of the Mexican-American War.

The AP evolved from the old Harbor News Association that was established in 1848 by five New York daily newspapers when they agreed to pool information traffic and share the costs of covering the Mexican-American War. This included the expense of chartering a steamer from Boston to act as a news dispatch boat to meet ships from Europe at Halifax, Nova Scotia, and the cost of telegraphing the news that the steamer obtained from Boston to New York. Moses Yale Beach (1800–1868), the second publisher of the *New York Sun*, organized the venture. The other four daily publications joining the *Sun* were the *New York Herald*, the *New York Courier and Enquirer*, *The Journal of Commerce*, and the *New York Evening Express*. Two other newspapers, the *New York Tribune* and *The New York Times*, joined later.

James Gordon Bennett, editor of the *Herald*, used the telegraph to advance in the New York circulation wars. Over the next several years, many cities across the United States were connected by the telegraph, including those in the

west. Bennett's *Herald* was the first major newspaper on the East Coast to report the discovery of gold in California in the August 19, 1848, edition. The California Gold Rush officially began on January 24, 1848, with the discovery of gold at Sutter's Mill in Northern California. Yet most people in America at the time were not aware of the strike until seven months later, when the *Herald* reported on the rumors of gold in California. This announcement encouraged people to leave their homes and head west for the gold rush.

In 1850, the newspapers created the Telegraphic and General News Association of New York to receive telegraphic news from Boston, Washington, and other locations. The agency had two other name changes before becoming the New York Associated Press (NYAP) in 1858. The NYAP maintained access to its original members, representatives in other major American cities, and the Reuters news agency. It also contracted with other regional news agencies in other parts of the United States. By 1850, the group had its first paying customers, the *Philadelphia Public Ledger* and the *Baltimore Sun*, which were given access to wire service dispatches for a fee without becoming actual members of the cooperative. Over the next several years, the number of client newspapers outside of New York grew, and the agency was able to recover about half of its expenses. The NYAP maintained its transmission costs by sending news to each geographical area only one time. The newspapers in each area were left to distribute the news among themselves. This led to the formation of several regional associations modeled on the NYAP.

The NYAP faced competition from the Western Associated Press, which was organized in 1862 after several Midwestern daily newspapers criticized NYAP's monopolistic newsgathering and pricing methods. Other groups sprang up over the next few years, including the Northwestern Associated Press, the New England Associated Press, the Philadelphia Associated Press, and the New York State Associated Press. As the regional associations, especially the WAP, gained strength, friction developed between them and their New York parent. The Western papers felt they were being overcharged for European news, which by the 1860s was flowing steadily to the United States by underwater telegraph cable. Agreements were

made, leading to peace for several years. Several competitors to NYAP arose during the 1870s, but none were able to break the virtual monopoly NYAP held on the transmission of domestic and international news by wire. The first serious rival emerged in 1882 when the United Press (UP), led by William M. Laffan of the *New York Sun*, was formed.

In 1891, Victor Lawson of the *Chicago Daily News* produced evidence that top executives of the NYAP and UP had engaged in a secret agreement that gave UP free access to NYAP News. Angered by this revelation, NYAP's Western members broke from the association and established the AP of Illinois under the leadership of general manager Melville Stone in 1892. The NYAP folded and its original members defected to the UP. However, the AP's contracts put UP in an untenable position, and by 1897 the UP relented. All the New York dailies except the *Sun* and William Randolph Hearst's *Journal* were given memberships in the new AP. Meanwhile, the telegraph continued to improve. In 1899, the AP performed the first news test of the new wireless telegraph invented by Guglielmo Marconi when it covered the America's Cup yacht race at Sandy Hook, New Jersey.

In 1870, three major European news agencies—Reuters in Great Britain, Havas in France, and Germany's Wolff in Germany—combined efforts to divide world coverage. Reuters covered the British Empire, including China and India; Havas was responsible for the French empire, including much of Africa and all of South America. These three shared all the news they received. Under Stone's leadership, the AP joined the Reuters-Havas-Wolff news cartel in 1893, remaining with the arrangement until it dissolved in 1934. The AP, to compete with UP, concentrated on international expansion in the 1930s by establishing foreign news bureaus in other countries.

In 1900, the Illinois Supreme Court ruled in the case of *Inter Ocean Publishing Co. v. Associated Press* that the AP was a public utility operating in restraint of trade. This decision meant that the AP had to provide service to anyone who wanted it. The AP opted not to follow Illinois high court's ruling, and the AP of Illinois was dissolved. This resulted in the AP's move from Chicago to New York City, where the AP could organize as a

nonprofit membership association. Stone continued in his role as general manager. Further, the AP could maintain control over who was accepted as a member. The new AP was a cooperative, in which the members shared news and the costs of maintaining staff to control the flow of news among members.

Growth in the 20th Century

By 1880, one-third of all dailies in the United States subscribed to the AP, which relied mostly on Western Union to carry its press reports over the wire. In 1893, the organization shortened its name to the AP. The AP provided coverage of the Spanish-American War that amounted to about \$250,000 in expenses in 1898, including the costs of dispatch boats and wire charges. A year later, the AP used Guglielmo Marconi's wireless telegraph to report the America's Cup yacht race off Sandy Hook, New Jersey. This marked the first news test of the new telegraph.

By 1914, the AP had about 100 member newspapers. Until 1915, AP members were prohibited from buying news from other services. There were, by this time, two viable competitors from whom AP members could get additional news: the United Press Association, formed in 1907, and the International News Service, founded by Hearst in 1909. The original UP agency, after thriving for a few years, had collapsed by 1916.

From 1892 to 1921, Melville Stone, who had founded the *Chicago Daily News* in 1875, served as general manager of the AP when it was established in Illinois. Throughout his tenure, he embraced the standards of accuracy, impartiality, and integrity—journalistic qualities that continue to serve as the news agency's foundation. The AP became one of the world's most prominent news agencies under his leadership.

Under the tenure of Kent Cooper, an Indiana reporter who joined the AP in 1910, the AP cooperative evolved rapidly. Prior to joining the AP, Cooper approached Stone with a proposal to use telephone rather than telegraph to send news to newspapers. With the emergence of the teletype machine in 1913, the telephone approach was short-lived. However, because of his innovative spirit, Stone hired Cooper as AP's traffic chief. Cooper climbed the AP career ladder to assistant

general manager by 1920 and later led the AP from 1925 to 1948. During his leadership, he grew the bureau staffs in South America, Europe and, after World War II, the Middle East. He emphasized news reporting as a more effective prose style. He also incorporated new technology into the news dissemination process, introducing telegraph printing and the first system to transmit photographs via wire into the offices of the AP in 1927. He also advocated for the freedom of the press and the public's right to know.

One of Cooper's most significant contributions in the United States was the development of state bureaus as AP's primary operating units. He also expanded coverage to reflect the public's changing interests more effectively. This involved the addition of an afternoon sports service, as well as financial information and features. The AP also embraced human interest stories, which it had historically disdained, leading to the organization's first Pulitzer Prize awarded to Kirke L. Simpson in 1922 for a series on the Unknown Soldier buried in Washington, DC's Arlington Cemetery.

As modern media emerged in the first half of the 20th century, especially after World War II, the AP and other wire services used automated transmission equipment to create uniform news products sent to small towns and large cities, serving to standardize the formats of news articles. In 1914, Cooper introduced the telegraph typewriter, also known as the teletypewriter, into newsrooms. Member newspapers were equipped with the AP teletype machine that dispersed state, national, foreign, sports, and feature stories at 45 to 60 words a minute. The teletypewriter also was used by the United Press and International News Service. Styles in punctuation, capitalization, abbreviation, and other usage considerations differed among these news wire agencies. Together, in the 1950s, these news cooperatives agreed on a basic style and prepared a stylebook that set standards for style in the mainstream newspapers.

In addition, the AP started the Wirephoto network in 1935, which gave the news agency an advantage over other news outlets. This development allowed transmission of news photographs over leased private telephone lines on the day the photos were taken. The first photo to transfer over the wires was of a plane crash in

Morehouseville, New York, on January 1, 1935. The photo network initially was among the major cities of New York, Chicago, and San Francisco. Eventually, the AP's photo service spanned across the United States.

Meanwhile, some newspapers attempted to restrain other newspapers, especially those from the same market, from subscribing to the AP. The AP kept out new members until 1945 when the U.S. Supreme Court ruled that the AP had been violating the Sherman Antitrust Act by prohibiting member newspapers from selling or providing news to nonmember organizations as well as making it difficult for nonmember newspapers to join the AP. This legal decision particularly favored, for example, the *Chicago Sun*, which had been blocked from AP membership by the *Chicago Tribune*. Prior to the court ruling, newspapers with AP memberships had been allowed to refuse competing publications from subscribing to the AP. This meant that publishers either were forced to buy weak newspapers with existing AP memberships or subscribe to other wire services, such as the United Press International.

Challenges that involved the rise of radio also surfaced for the AP in the first half of the 20th century. In 1933, the American Newspaper Publishers Association pressured the AP and other wire services to stop providing news to radio stations, although brief bulletins were allowed to encourage people to read the newspaper. The effort was not successful, as radio networks established their own news operations. The AP started a service in 1940 for radio clients, expanding from print to radio broadcast news, and created its own radio network in 1974.

By the early 1980s, newspapers generated approximately half of AP's revenues. New media, especially cable television, began to minimize the newspaper's role in delivering news to Americans. In 1982, the AP amended its bylaws to allow the use of its news reports by member newspapers on cable systems. The AP also developed ways of transmitting news reports via satellite. By 1984, more than 300 news and photo bureaus throughout the world were part of AP's global network, delivering reports to 1,300 daily newspapers and 5,700 broadcast stations in the United States. In addition, there were 8,500 subscribers in foreign countries.

The United Press International was the AP's major competitor and longtime rival until it collapsed in 2000, leaving the AP as the only nationally oriented news service based in the United States. The other news services that had divisions to communicate their news reports, such as Reuters in Great Britain and Agence France-Presse in France, remained AP's rivals.

21st Century Developments

The AP practices a straightforward, "just-the-facts" writing style, often using the journalistic story structure known as the inverted pyramid to allow news stories to be edited to fit available space in a newspaper without losing the essence of the story. This can be attributed to the telegraph because publishers wanted as few words transmitted as possible to save on wire costs. This style of writing would prove to be useful for the AP as it would come to rely on the Internet and digital technology in the early 21st century. This time period reshaped how the AP distributed its news reports, evolving as an interactive endeavor between AP and its 1,400 U.S. newspaper members as well as broadcasters, international subscribers, and online customers. In 1994, the AP established the London-based Associated Press Television News (APTN), a global video news-gathering agency. The AP later purchased Worldwide Television News from the ABC News division of the Walt Disney Company. APTN then merged with Worldwide Television News in 1998 to establish APTN, which provides video to international broadcasters and websites. In 2003, the AP became the first news agency to offer a live video news service.

In early 2005, the AP launched a new website focusing on the Freedom of Information Act to help news consumers be more aware of their rights toward governmental disclosure. The AP also joined a group of journalists and newspaper organizations to form the Sunshine in Government Initiative, designed to fight increased secrecy in the government.

By 2016, the work of the AP was published and republished by more than 1,300 newspapers and broadcasters. The AP also operates the AP Radio Network, which provides newscasts twice hourly for broadcast and satellite radio and television

stations. Along with APTN and AP Radio Network, other principal operating units are AP Ad Services, AP Broadcast, AP Digital, AP International, and AP Photo Services.

Many newspapers and broadcasters outside the United States are AP subscribers, paying a fee to use AP material without being contributing members of the cooperative. As part of their cooperative agreement with the AP, most member news organizations grant automatic permission for the AP to distribute their local news reports. In 2019, the AP produced 2,000 stories and 3,000 photos daily.

Election and Sports Polls

In 1848, presidential candidate Zachary Taylor and the Whig Party won the White House. The AP used the telegraph to declare Taylor the next president of the United States. Since then, the AP has tracked voting in U.S. elections, including national, state, and local races, plus key ballot measures. The AP collects and verifies returns in every county, parish, city, and town across the United States and declares winners in more than 5,000 contests.

The AP is the only organization that collects and verifies election results in every city and county across the United States for all political races on the local, state, and federal levels. Using a 50-state network of freelance "stringers" who collect votes from county clerks and other local officials, the nonprofit wire service is known for its integrity and accuracy, so much so that major news outlets rely on AP's polling data and results before declaring a winner in major political races, especially the presidential election. Early in U.S. history, elections took place over many days, and not all states voted on the same day. The advent of the telegraph contributed to the development of a single presidential election day in the country. Rather than learning the results in mid-December when the Electoral College representatives from each state meets to cast their votes, Americans and candidates often turn to the AP for the announcement of the victor based on the vote count.

The AP's complex process involves a reliance on a network of local reporters who have extensive knowledge of assigned territories and relationships with county clerks as well as other local

officials. Plus, other AP journalists monitor and gather data from county websites and electronic feeds provided by states. The research team made up of analysts further verifies the results by considering demographics, number of absentee ballots, and other political issues that might affect the final results.

In addition, the AP in 2018 began using a machine called *VoteCast* as an exit polling approach to survey people via phone and online surveys whether they voted, their ballot choices, and the reasons for their selections. The 2020 presidential election is the first time that the AP used *VoteCast* in a presidential election. Prior to the implementation of *VoteCast*, AP reporters surveyed people leaving their polling precincts after they voted to find out for whom they voted.

Along with election polls, the AP conducts college sports polls in the United States. Weekly rankings of the top 25 NCAA teams are provided in each of three Division I college sports: football, men's basketball, and women's basketball. The rankings are determined by 65 sportswriters and sports broadcasters who are polled across the nation. Voters provide their own ranking of the top 25 teams. The individual rankings then are calculated to produce the national ranking by giving a team 25 points for a first-place vote, 24 for a second-place vote, and so on, with 1 point for a 25th place vote. Ballots of the voting members in the AP Poll are made public.

The AP compiles preseason polls, regular season polls, and final season polls. The AP college football rankings were created in 1936 and began including the top 25 teams in 1989. Since 1969, the final poll of each season has been released after all bowl games have been played.

The AP college basketball poll launched in 1949. The college basketball poll started with 20 teams and was reduced to 10 during the 1960–1961 college basketball season. It returned to 20 teams in 1968–1969 and expanded to 25 beginning in 1989–1990. The final poll for each season is released prior to the conclusion of the NCAA tournament, so all data include regular season games only.

Although the AP sports polls focus mostly on collegiate sports, the AP began issuing a weekly pro football ranking, the AP Pro32 rankings, in 2012.

AP Stylebook

In the 1950s, the AP, the United Press International, and the International News Service produced a stylebook that reflected their agreement on how punctuation, capitalization, abbreviation, and other language matters should be treated. This stylebook set standards for mainstream newspapers to follow in their news copy. In August 1977, the AP printed its first edition of the AP Stylebook, which was 60 pages and bound together with staples. A basic guide for news writing, the AP Stylebook has evolved into a comprehensive reference manual and a resource for writers. Once published annually, the AP Stylebook began publishing biennially with the 2020–2022 edition.

The stylebook, which has become the standard for news writing in the United States, features basic rules on grammar, punctuation, usage, and journalistic style. In addition, the book is divided into sections about media law, social media, health and science, data journalism, business, sports, religion, and other topics. Plus, new entries are added to reflect changes in language. Throughout the year, top AP editors discuss possible updates and improvements to the stylebook. If the changes are approved, the updates are published immediately in the AP Stylebook online. The AP staff, member news organizations and subscribers, journalism teachers and students, and other individuals also contribute ideas for new or revised stylebook entries.

AUDIENCE RESEARCH

Many journalism stakeholders believe they need to better understand and communicate with the news audience to accomplish their goals, a significant departure from the profession's previous approach to its readers. News organizations routinely draw on analytic data to quantify their audiences—and pursue a variety of techniques designed to engage with them—in hopes of shifting to more audience-supported revenue models, improving the quality of their journalism, and increasing the level of public trust in news media.

Journalism's privileging of the news audience has identified what some see as a need for journalism studies scholars to understand who the news audience comprises, who it excludes, and what its members actually want from the news. This entry uses the changing dynamic between news producers and consumers as an opportunity to review the primary methods researchers draw on to study news audiences and to describe each method's strengths and weaknesses. These methods include quantitative approaches such as surveys, digital trace data analyses, and experiments, as well as qualitative approaches such as interviews and focus groups. They also include more innovative, recently developed approaches to studying news audiences, including two-sided ethnography as well as data collected from observations of journalists and audience members interacting with one another.

The entry concludes by discussing potential research into the news audience. It suggests possible studies that could embrace mixed-methods, cross-national, longitudinal, and comparative approaches to help researchers better understand how news audiences differ from one context to another, whether their behaviors and attitudes align with or contradict journalists' assumptions, and even *if* news audiences' expectations of journalism can ever truly be known.

Quantitative Methods

Scholars utilize a number of quantitative methods when it comes to researching and understanding audiences. The most common approaches include surveys, experiments, and analyses of digital trace

data. These approaches are typically aimed at understanding how frequently audiences interact with news, as well as how they feel about the news they are (or are not) consuming. Some of these methods are better suited for the former, and some for the latter.

Surveys

Studies that utilize surveys to understand news audiences tend to ask respondents to provide self-reports of their media use. Consequently, scholars who utilize surveys must reckon with the fact that news audiences are notoriously bad at accurately recalling where they get their news, as well as how much time they spend with it. Indeed, Markus Prior found that self-reports of news exposure can result in the inflation of the size of the news audience by more than 300%. However, surveys are useful for capturing how a large number of people feel about the news that they choose to consume. Scholars at the Reuters Institute for the Study of Journalism at the University of Oxford, for example, regularly utilize surveys of people in countries throughout the world for their annual Digital News Reports. In doing so, they provide insight into some of the most pressing topics in journalism, such as people's trust in news media, concerns about fake news, and willingness to pay for news.

Experiments

Experimental studies allow scholars to overcome these issues of self-reporting that arise in surveys. They do so by creating an environment in which participants are asked to engage with news in some observable way. Consequently, in their effort to test a specific hypothesis, the researchers behind these experiments are only able to emulate a narrow slice of the actual news media environment. This methodological approach to audience research may therefore have the undesired effect of leading participants to act differently within these experiments than they would in real life. Additionally, because these experiments limit the number of available media options—typically to a number of news sites—they leave unanswered the question of whether the participants of these studies, if left to their own devices, would even choose to consume news in the first place.

The upside to this approach is that experiments can accomplish something outside the scope of other audience research methods: demonstrate a causal relationship. While other methods such as analyses of digital trace data and surveys reveal both how audiences engage with news and how they feel about the news, neither is as well-suited as experiments are for demonstrating the effect of specific interventions within journalism on altering news audience behavior or perceptions. Experiments have been successfully utilized to reveal how audiences respond to comment sections below news stories, framings of content within news stories, social media discussions about news stories, and assessments of when and how audiences choose to verify the news that they encounter.

The value of experimental studies of news audiences has become especially clear more recently, as this sort of research can be used to test the hypotheses people have for how best to improve journalism's financial and credibility challenges. For example, many within the news industry believe that audiences are more likely to find news stories credible if those stories are accompanied by demonstrations of journalistic transparency, such as reporter biographies, story labels, and explanations of how news stories get reported. Scholars at the Center for Media Engagement at the University of Texas at Austin have performed a variety of experimental studies that have shown which of these sorts of attempts at transparency impact audience trust—as well as which do not. At a moment when many within the news industry are convinced that drastic changes should be pursued to improve journalism's standing among the public—as well as its economic prospects—news audience research that utilizes experiments are increasingly indispensable as a means by which scholars and practitioners can uncover which of these changes may succeed.

Digital Trace Data

Finally, scholars using quantitative methods to study news audiences frequently draw on data derived from passive observations of actual audience behavior. These data—sometimes referred to as digital trace data—tend to derive from commercial firms such as Nielsen and Comscore, both

of which passively monitor the media consumption of representative panels of citizens within specific countries and then uses those panels to provide reports of aggregate online audience behavior. Comscore data, for example, provide monthly reports of aggregate audience behavior that show which news sites audiences visit, how much time they spend on them, and the degree to which audiences to one news site also visit another.

Yet online audience data are valuable because, unlike self-reports and experiments, they show how audiences actually behave within the real world, thus allowing them to overcome some of the accuracy issues presented by these other methods of news audience research. These sorts of data can therefore be quite useful when it comes to answering important, ongoing questions throughout the field. For example, many believe that news audiences self-segregate into ideological “filter bubbles” or “echo chambers,” wherein they only consume news from politically like-minded news sources. However, research drawing on data derived from actual observations of audience behavior consistently concludes that audiences instead tend to congregate among a small number of familiar, highly popular, and far less ideologically extreme news sources.

A significant downside of digital trace data is that, because these data are collected passively from actual people interacting with media within the real world, their ability to illustrate any sort of causal relationship is limited. Furthermore, although they reveal how audiences actually behave, they do not reveal *why*. To understand the motivations underlying audience behavior when it comes to news consumption—as well as how audiences feel about the news they choose to interact with—it is therefore helpful to turn to more qualitative methods.

Qualitative Methods

In addition to these quantitative methods, journalism studies scholars have increasingly begun pursuing a variety of qualitative methods to understand the motivations underlying audiences' approaches to news, as well as the assumptions they have about who news

organizations comprise, how the news gets reported and published, and how much (or how little) the news should ultimately be trusted. These methods typically take the form of interviews with individual audience members, as well as focus groups that assemble a number of audience members for the purpose of holding a discussion framed around how they feel about the news. These types of interview-dependent, qualitative methods have long been the norm within journalism studies for understanding news *production*—the discipline includes many influential ethnographies that draw on interviews and observations to assess how journalism gets made, as well as how journalists perceive their profession and the way in which it has changed over time. However, the application of these methods to understanding news *consumption* is a much more recent—and welcome—phenomenon.

These types of studies are especially useful for understanding how different types of people perceive the news, what they think journalists do well, and what they would like to see journalists do differently. Ruth Palmer, for example, interviewed ordinary citizens who became sources for news stories and, in doing so, discovered that how the public *perceives* of journalists is very different from how journalists tend to perceive themselves. This research is consequently much more effective at investigating the root causes of journalistic distrust than other methods of audience research and has become popular among scholars looking to better understand how people living within marginalized communities consider and approach the news. Although these methods suffer from the same limitations as qualitative studies of newsrooms—namely difficulty generalizing findings—they are remarkably effective when it comes to exploring underlying motivations, assumptions, and preferences that ultimately shape how news audience behavior unfolds. In short, while quantitative methods are highly useful for understanding the *what* and the *how* of audience behavior, these qualitative methods are well-equipped to explore the *why*.

AUDIENCES

Journalists, like all media producers, depend on their audiences for both societal relevance and economic stability. A news story that exposes government corruption, for example, is unlikely to result in any sort of reaction unless that story first grabs the attention of the public. And news organizations are unlikely to survive financially unless they reach a group of people large enough—or loyal enough—to make advertising- or subscription-supported revenue models feasible. Journalism does not solely comprise reporting, writing, and publishing the news—it also includes the act of building and maintaining audiences, groups of people who are willing and able to consume the news.

Consequently, journalists have always considered their audiences in one way or another as they have gone about performing their duties. Although the tools journalists rely on to understand, measure, and communicate with their audiences have changed over time, the sense that journalists must

give at least some thought to the people they hope to reach has held constant. Furthermore, in addition to navigating a seemingly endless amount of competition in the contest for audience attention, journalists now also must deal with historically low levels of trust in news as well, according to Megan Brennan (2019). The result is a situation in which it is perhaps more important than ever before for journalism scholars to understand how journalists perceive audiences, as well as how audiences perceive journalists.

This entry examines these two issues. It begins by exploring scholarship focused on how journalists perceive and approach audiences. It then explores scholarship focused on how audiences perceive and interact with journalism. It concludes by exploring the implications of both for the relationship between those who make the news and those who consume it.

Defining Audiences

Although the term *audience* is ubiquitous throughout journalism research and practice, its meaning lacks both an obvious and a universally agreed-upon meaning. At their most basic, audiences are collective entities. They comprise people who are at the receiving ends of message producers. However, the way that reception unfolds—specifically the extent to which that reception is either active or passive, has changed over time. Before the written word, message production and reception occurred at the same time, in the same place. Consequently, the interplay between media producers and the audiences assembled before them was both active and interactive. Equally important, the size and composition of audiences were more straightforward, as these audiences comprised the very real group of people assembled together to watch something.

The advent of the written word, followed by the printing press, and more recently digital communication, has both transformed and complicated the relationship between media producers and their audiences. Understandings of what makes an audience expanded to include not only groups of people standing before a performer but also any person reading a newspaper, listening to a news broadcast, or, more recently, reading or watching a news story online. In short, media

reception expanded from being solely public, immediate, and communal to also involve something more asynchronous, private, and individual. The process by which determinations were made about who comprises the audience consequently grew less affixed to what media producers could see before them as they delivered their messages.

Instead, audiences became an abstraction. Audiences are *real* in the sense that how they are perceived and pursued by media-makers has real consequences both for those who create media and those who receive it; however, audiences are also artificial, man-made conceptualizations more than they are reflections of reality. The result is the ironic set of circumstances that continue to face journalism researchers and practitioners: Those on the receiving end of news are among journalism's most important stakeholders—yet they are also the most unknowable.

This “unknowability,” combined with the necessity for journalists to find and maintain audiences, raises two questions within the profession that continues to be among the most significant—and consequently most studied—aspect of the relationship between those who made the news and those who consume it:

1. How do journalists determine who their audiences comprise and what they want from news?
2. How aligned are journalists' determinations about their audiences with their actual audiences?

Journalism's Perception of and Approach to Audiences

Historically, journalists have perceived their audiences through a fairly narrow lens. Because news audiences are in many ways unknowable, journalists rely on their own assumptions to fill in the gaps. What this means in practice is that journalists typically envision their audiences as looking much like themselves. Even when news audiences comprise a diverse mix of people across different geographic, socioeconomic, and political circumstances, journalists envision those audiences in ways that are much more homogenous.

For example, in the United States, journalists have traditionally written their stories for white,

middle-class citizens. A review of seminal ethnographies about journalism that were published throughout the 20th century reveals that, at least within the United States, journalists envisioned their audiences as extensions of themselves or their peers. This approach to news audiences is consistent across media platforms such as broadcast and print. It is also consistent when it comes to journalists within both national and local news organizations.

There are two reasons for this consistent perspective of the news audience. The first one is the tension between scale and imagination. Journalists have historically seen the audience as a large, homogenous mass of people. The advent of mass media (i.e., media that have the ability to reach a large number of people) was accompanied by the notion of the mass audience (i.e., the large group of people on the receiving end of said media). It is therefore difficult—if not altogether impossible—for media producers to hold a comprehensive understanding of all the different kinds of people their media can reach. In the absence of such absolute knowledge about or understanding of these mass audiences, media-makers generally—and journalists specifically—instead tend to envision their audiences as comprising their peers, supervisors, and competitors.

The second reason that this narrow perspective of the audience has held constant even as the media environment has undergone significant changes over time is because of the demographics of those who actually make the news. Newsrooms have historically comprised reporters and editors who have overwhelmingly been white, middle class, and male. The demographics of newsroom staffs, in other words, have long been out-of-step with the demographics of the people they hope to reach. So, when journalists skew white and male, the prevailing understanding of the news audience follows suit.

Journalists have also traditionally perceived audiences as passive recipients of the news, rather than as active participants in the news. This perception of news audiences among journalists stems from two long-standing assumptions: first, that audiences lack the expertise and skills necessary to do more than simply consume news; and second, that audiences lack an interest in expanding their relationship with news beyond that of

reception. Consequently, journalists have historically been dismissive of—and uninterested in—feedback from their audiences. In short, instead of conceptualizing their audiences as comprising a diverse mix of people with an interest in not only consuming the news but also more meaningfully participating in its production, journalists considered their audiences monolithic and passive.

Audiences in Transition

These circumstances have begun to change over the course of the first few decades of the 21st century as the news industry has confronted a much less hospitable set of circumstances in a digital environment from what the profession previously faced. Journalism faces a combination of economic, technological, and social obstacles that have caused the news industry to plunge into a period marked by uncertainty and instability. Journalism credibility and revenue are both low, as newsrooms struggle with limited resources to recapture the audience trust, attention, and support they took for granted throughout much of the 20th century.

These circumstances have led journalism stakeholders to consider different approaches to measuring, understanding, and approaching news audiences. Audience measurement tools, for example, have grown increasingly popular in newsrooms across the globe as news publishers look to better understand what their audiences were choosing to spend time with when it comes to journalism. Although news media publishers have previously drawn on measurement tools and services to quantify their audiences in one form or another (e.g., numbers of subscriptions for newspapers, television ratings for broadcast and cable news), the role of measurement has expanded due to financial necessity for and technological sophistication of digital audience analytics. Now, many news organizations maintain subscriptions to a number of online audience measurement providers, such as Google Analytics, Chartbeat, and Comscore. These measures are capable of tracking, among other things, the amount of time audiences spend with news, the size of the audience that a news site attracts, and the way in which audiences share news content via social media.

What these measures cannot do, however, is reveal audiences' underlying motivations. These measures reveal *what* audiences do, but not *why*. Consequently, even in an era of increasingly sophisticated audience data, journalists continue to rely on their gut instincts and intuition to draw conclusions about audience behavior. This explains why there is inconsistency throughout journalism surrounding what audiences want and expect from news. For example, while many journalists continue to believe that audiences want a relationship with news in which they are passive recipients of news content, a growing contingent of the news industry believes that audiences would like a more active role in journalism. Consequently, a number of journalism publishers, practitioners, funders, and researchers have begun advocating for the news industry to practice more "engagement" with their audiences, by explicitly offering audiences opportunities to participate in the news production process.

The pursuit of "engaged" journalism within the news industry, as well as its increasing acceptance in certain segments of the profession, illustrates the power and inconsistency of *perceptions* of the news audience, as well as the limitations of audience data. Because audiences can never truly be known, journalists will continue to draw on a variety of tools as well as their own instincts and intuition to fill in the blanks about the people they are attempting to reach.

Audiences' Perceptions of and Approaches to Journalism

While news audiences can never expect to be fully understood, a rich body of journalism and audience research has shed light on important and revealing elements about news audience behavior. Perhaps the most notable, overarching theme of this line of research is that, when it comes to news consumption, audiences are not driven solely by their tastes and preferences, nor are they pulled to news solely by mechanisms outside of their control. Instead, according to it is the interplay between the structures of everyday life and the preferences of individual audience members that shapes news audience behavior. Communication scholar James Webster refers to this approach to understanding how media audiences take shape as

a *structural* approach—one that considers the interplay between agents and structures. This theory originates from sociologist Anthony Giddens's notion that the social world is mutually reproduced and altered by agents and structures through the process of "duality."

A number of studies have explored the implications of this dynamic as it relates to news audiences. For example, a growing body of research has concluded that news audiences tend to congregate among a small number of familiar brands, even as the news media environment continues to grow saturated with options. This phenomenon does not occur because audiences share widespread agreement regarding the best and worse news brands, nor does it occur because these news brands are best equipped to push their content onto unsuspecting news audiences. The answer instead is a bit of both. People privilege popularity when it comes to evaluating quality, as do structures such as social media platforms and search engine algorithms.

Why, in a news media environment where people can access all sorts of news media—including that which most aligns with their preferences—do so many congregate on a small number of familiar news brands? First, research has shown that audiences tend to stick to their media habits, even when the media environment undergoes significant changes, and these habits are predisposed toward popular content. In addition, the structures that comprise the news media environment, such as social media platforms and search engines—privilege popularity over most other media attributes. Finally, there is a vicious cycle effect, in that the news brands that comprise the largest audiences usually have more financial resources available, allowing them to invest in the means by which they can ensure their content is more prominent and available to audiences than that published by their smaller, less popular competitors.

While the audience research just described focuses on how audiences *consume* the news, other research has utilized a variety of innovative methods and theoretical frameworks to better understand how audiences *perceive* the news. For example, a number of scholars are interested in understanding what determines audience trust in news, as well as whether a relationship exists

between audience trust in news and loyalty to news. More recently, as many within the news industry pursue novel ways to improve their engagement with and representation of their audiences, a growing body of scholarship has explored what impact these interventions have on how news audiences perceive and approach the news.

In addition to seeking to understand how news audiences perceive the news, and how those perceptions shape their interactions with the news, scholars have also begun to study those who go out of their way to *avoid* being part of the news audience in the first place. Part of the reason this topic is attracting more attention is because the number of people who seek to remove themselves from the news audience appears to be growing. As economist Markus Prior found, the increasing variety of media options in a digital media environment means people now find themselves faced with a seemingly infinite number of alternatives to news. Consequently, it has grown much easier for people with little interest in news to remove news from their media diets and replace it instead with something they find more entertaining. Understanding the growth of this group is therefore increasingly important for those within journalism seeking to improve their relationship with their audiences and for those who study journalism seeking to understand what motivates audiences to tune in—or tune out—of the news. In addition, as the news industry becomes more audience-focused, news organizations become more determined to reach specific, niche audiences rather than a single, large, monolithic one. This shift raises important questions regarding which audiences journalists choose to pursue, which they do not, and why.

The news industry continues to grow more audience-focused in hopes of recovering audience trust and support necessary for the profession's continued survival. As this transition unfolds, journalism researchers and practitioners would do well to remember that, regardless of how much thought and attention is given to the audience, and how much data are collected from the audience, news audiences themselves can never be truly known. Consequently, the efforts by journalists to reach their audiences will always be based at least in part from their assumptions about the people they hope to reach. Furthermore, the

extent to which audiences consume, interact with, or avoid news will stem not only from their own tastes and preferences about the news but also from the structures that comprise the news media environment.

AUDIO AND VIDEO NEWS SERVICES

An audio or video news service is usually a commercial entity that provides prerecorded sound or video for news media, general business corporations, or (more recently) individuals. In its overall purpose, it somewhat parallels the function of a photo agency. Some entities operate as a part of long-recognized news services (such as the Associated Press or CNN) that make their own reports or footage available, but increasingly, many are independent firms making use of the Internet for inexpensive distribution of both professional and amateur (or “home”) audio or video recordings.

Audio and video news services developed as recording and playback technology made them possible. In the Internet era, much of the business lacks a formal structure—there are new companies popping up all the time. Some firms produce video news releases, while others focus on producing “stock” audio or video that can be used as background for station news programs.

Audio News Services

Audio news services appeared as effective means of analog sound recording made them possible. The earliest began in the 1950s as more and better

reel-to-reel audio tape recording equipment became available, and as equipment prices dropped. The innovation of audio tape cartridges and cassettes in the 1960s and 1970s made the handling of sound recordings much easier for stations to use. Early automated radio station operations relied on such technology where music and advertisements could be preprogrammed, allowing occasional inserts of live news and other features.

Both United Press International (which was first, in 1958) and the Associated Press initiated audio services to serve their radio station subscribers with recorded hourly newscasts and sound actualities they could insert into their own news. Stations received a daily menu of recorded stories and features from which they could select. For the first time, even “local” radio news from smaller markets could feature a variety of audio features from across the country and around the world. Audio quality was a problem as the news agencies used telephone lines for distribution. AP Radio began in 1974 and became a 24-hour all-news operation two decades later. UPI Audio became the UPI Radio Network with extensive hourly feeds to local stations, but closed in 1999 as the parent agency began to wither.

Government agencies quickly joined what became an expanding audio services bandwagon. Many federal agencies maintain sources of sound bites and scripted reports for news media use (though others can also use them). The U.S. Department of the Interior, to cite one example, provides recordings concerning the national parks, as well as Native Americans. The Department of Education offers recorded reports on all aspects of primary and secondary education. Availability of such audio reports makes their use by broadcast stations more likely.

One type of specialized audio service that dates to the 1930s is the production and distribution of sound effects. While early stations and fledgling networks produced needed sounds in the studio (as in the network *March of Time* series), by the late 1930s, prerecorded sound effects of all types were coming on the market for use by radio journalists and others as needed. Indexed collections of 78-rpm discs provided almost any imaginable sound effect. Most were used in drama, as most radio broadcasters traditionally conceived of news

as using only sounds that might be actually present and not added later on.

Video News Services

Several factors contributed to the development of video news services, the first of which was technology, as had been the case with audio. News film was the only means of recording images for television for the medium's first decade. It was cumbersome to use and required extensive processing before it could be used on the air. Major news events—such as the coronation of Queen Elizabeth in London in June 1953—were filmed and (in this one case) the film was developed aboard aircraft flying across the Atlantic to Canada. From there, developed pictures were sent to New York for transmission by the networks to their affiliates—all less than a day after the real events. Still, the process was time consuming and costly.

The transformative breakthrough came with video tape recording in 1956. While pricy and cumbersome at first, and thus used only on the network level (including for both the CBS and NBC evening newscasts), video equipment grew both smaller and less expensive. Development and use of time-base correctors and other devices made use of video recordings on the air easier. As programming (newscasts and documentaries) became widespread, demand by networks and stations for video clips and reports rose. By the 1970s, portable equipment further expanded video use. And in the next decade widespread availability of satellite distribution made transmission of video news and feature material to stations and cable systems almost cost-free.

As with audio recordings, federal departments (and many nonprofit organizations as well as commercial courses) soon provided video as well. The U.S. Department of Defense, for example, became a ready source for video clips, often completing narrated reports on weapons of land, sea, and air.

Developing Online Services

Just as technology had made earlier audio and video news services possible, development of the

commercial Internet in the mid-1990s soon suggested new options. Audio was used first in an era of narrowband connections and limited capacity. Many organizational websites soon offered archives of audio news and related clips, chiefly for news media, but often available to anyone.

Adding broadband capabilities by the 2000s opened up the ability to syndicate speedily video to news media as well as individual consumers. Facebook and other popular networking websites soon flooded over with news clips. Advertisers, eager to reach a global audience, snapped up options to purchase space on such websites, which provided free consumer access.

Broadband distribution further blurred the one-time division between traditional journalism and wider civic participation and sharing of news. Such widespread distribution naturally raised questions of copyright. Websites made clear that material was copyrighted and placed limits on how it could be used (beyond individual viewing on personal computers or laptops).

MSN Video was by the mid-2000s the largest video-only streaming service on the web, offering 41 channels of content updated many times each day. In addition to streaming an average of 66 million news, entertainment, and sports video clips per month from more than 45 content partners, MSN Video provided an array of live events. Advertiser supported, MSN Video is available to consumers at no charge and is available in the United States, Canada, Japan, and Australia; and in beta testing in the United Kingdom.

Announced late in 2005, the Associated Press's Online Video Network (OVN) was launched early in 2006 and by mid-2007 was reaching 61 million unduplicated visitors and serving over 1,800 radio and television affiliates after having begun with less than 500. Using a Microsoft Network local video contribution option, OVN affiliates could use their own content to combine AP breaking news video with national advertising. Also by mid-2007, OVN was providing some 40 video clips per day covering national, international, technology, business, and entertainment news. At about the same time, CNN.com launched its own broadband video news service and the other cable and broadcast networks were soon active as well.

AUDIO JOURNALISM

Since large-scale production of Guglielmo Marconi's radio began in the 1920s, audio journalism has played a prominent role in the way the world consumes news and information. Now, nearly a century since the first news reports were delivered via modulated radio wave, audio journalism is not simply relegated to traditional terrestrial radio stations, but is streamed via the web, delivered across cellular networks, and downloaded via mobile devices.

Although more than a century has passed since the invention of the radio, audio journalism finds itself in a renaissance period. With the ubiquity of smartphones, the speed of cellular data networks, and the plunging price point of professional audio equipment, there has been an explosion in the creation and demand of audio content. This entry discusses ways that audio journalism often differs from print journalism before looking at some of the features of radio journalism and digital audio journalism. It concludes by discussing some of the ways media convergence and digital technology have changed the work of an audio journalist.

How Audio Journalism Differs From Print

Writing for broadcast, podcast, or streaming media requires consideration of factors unique to aural media. Audio journalists are mindful that while a newspaper or digital article can be factual, grammatical, and readable, it may not be at all appropriate for a listening audience. Writing for the *ear* is different than writing for the eye. In a print article, a journalist can cram a significant amount of information into one sentence. If a reader becomes confused at any point, they can go back and reread the sentence. However, if the facts a radio correspondent is reporting are broadcast out of the speakers faster than a listener can absorb and process them, critical details can be misheard or lost entirely. Even with Internet archives, it is rare that a listener will take the time to relisten to an audio report after its original transmission. Additionally, print outlets have the luxury of a headline to alert readers what a story is about; no such device exists in the terrestrial broadcast form, so a strong introduction or lead-in is critical to engage the listener's attention.

To ensure maximum retention, audio journalists write in a style that may seem basic or unsophisticated on the printed page, but when read aloud, makes the salient points of the story clear and unambiguous. Simple sentence structure is stressed when writing for audio broadcast as is a basic vocabulary. Facts are presented in as direct and concise a manner as possible giving the listener an opportunity to absorb and register what is being delivered. Editors take great pains to ensure that information is given out at a pace that allows listeners to retain it.

Additionally, audio journalists are taught to write the way they speak. Listening is an innately personal activity. Often individuals are alone in their cars, by themselves at their desks, or tuning in through headphones when listening to the radio or a podcast. Audio journalists take advantage of this personal space by writing as if they are talking to a single person rather than the thousands of individuals who might be tuned in at any given moment. People generally do not speak the way they write; audio journalists craft scripts that feature similar syntax, vocabulary, cadence, and grammar to the way they speak, thus making their stories more personal. Additionally, by speaking in

their natural voice, rather than using the stereotypical “radio announcer” voice, audio journalists can foster connections with larger and more diverse audiences. Audio journalists entering the profession are coached to “forget” any preconceived notions of speaking on mic as well as most of the ways they learned to write in school, or at any of the print publications where they worked prior to their audio reporting career.

With the rapid growth of podcasting and other digital audio reporting platforms, many of the rules embraced by audio journalists for decades are changing. The core tenants of audio journalism have not changed, however: simple, clear, conversational writing. As this field of journalism continues to mature, the fundamentals central to writing for the ear will remain a key component of successful audio stories.

Radio Journalism

Newscasts

These short news reports are broadcast at least once each hour on many U.S. radio stations to update listeners on breaking news and other news headlines. Radio networks generally place newscasts at the top or bottom of an hour so listeners know exactly when they can tune in to hear what is happening. Newscasts can be as short as 60 seconds or up to 8 minutes in duration depending on the network and the time of day. Often newscasts are composed of short updates, lasting no longer than 20–30 seconds.

The most common types of stories in newscasts are “readers” where the newscaster reads a story from copy provided by a wire source, such as the Associated Press or Reuters. Newscasts can also feature submissions from reporters who file a “spot,” or a story containing actualities and natural and ambient sound. On rare occasions, a newscaster may interview a reporter about a high-profile news story that is updating by the minute. Radio networks that broadcast newscasts are time sensitive, lasting a specific number of minutes, as the network needs to rejoin other programming at an exact time. In network newscasts, time often dictates not only the number of stories presented but also the order of the stories. Breaking news generally leads the newscast followed by news that will

have the greatest impact on people, with other timely news presented afterward.

News Radio Stations—20-Minute Clock

Radio stations featuring an all-news format are generally programmed to deliver the day’s major stories in approximately 20-minute cycles. This specific time is equivalent to the average commute length, allowing listeners to consume the day’s most important news items in one sitting. Reporters and producers filing for a news radio station are generally given a specific length of time the story must fill by their editor ranging from 20 seconds to 2 minutes. When aired, these stories most commonly feature the anchor or host reading a brief lead into the story followed by the reporter delivering a report containing actualities and natural sound. Depending on the news cycle, these reports can be repeated numerous times over the span of several hours. As news radio stations often feature business, sports, entertainment, traffic, and weather reports along with advertisements, traditional news reporting might only account for 7 or 8 minutes of the 20-minute cycle. Editors at news stations must balance the mix of national and international news along with local and regional news to ensure listeners have an appropriate degree of coverage given the day’s events.

Newsmagazine Long-Form Features

Many public radio listeners are familiar with long-form features as they are the most common program element presented in the flagship drive-time programs, *Morning Edition* and *All Things Considered*. Generally between 3 and 5 minutes in duration, these reports incorporate a reporter’s audio copy along with a variety of outside voices, taken from interviews conducted for the piece, and natural and ambient sounds collected during the interviewing process. Unlike most reports filed for audio journalism outlets, newsmagazine stories are typically longer in length and take a more nuanced and in-depth look at a particular problem or issue. The result is these pieces feature actualities from interviews that are longer in length and provide more context than actualities or sound clips in shorter audio news reports.

A narrative style is generally utilized when reporting long-form features. This storytelling approach is often part documentary and part hard news. The scene in which the story takes place is generally a critical part of any long-form feature as it helps the listener establish a time and place in which to ground the report. The feature's characters are also critical to getting audience members to be willing to invest 3–5 minutes of their time listening to it. Long-form features are often framed as an argument, which allows the reporter to pose a problem at the beginning of the piece and feature voices from both sides of the issue to give the report as balanced a viewpoint as possible. This device assists the reporter in structuring a piece around the best interview recordings while maintaining a narrative flow that will be interesting and engaging when broadcast.

Two-Ways

Two-ways are how audio journalists refer to the on-air conversations between the host/anchor and the reporter. When news breaks and a report must be delivered quickly, it is logistically simpler for the host to ask the reporter on-site questions. Two-ways usually do not include the actualities or natural sound commonly found in reports filed for audio news outlets, but they do provide a sense of immediacy that is often absent from highly produced pieces. It is common for audio journalists to opt for a two-way when a deadline cannot be met or there is no audio to build a report around, as is the case when a statement is released but no one has yet commented on it.

Two-ways receive criticism when they come across as scripted. This stems from the fact that the journalists on site typically know the questions they will be asked beforehand; in some rare cases, the reporters write the questions for the hosts and script out their answers. This leads to additional detail that might be left out or forgotten in an unscripted conversation but sounds stilted and unnatural. Public radio reporters are commonly criticized for scripted two-ways. Two-ways work most effectively when the host and reporter confer beforehand and outline the topics to be covered during the interview. This leaves the host the flexibility to ask follow-up questions and the reporter the opportunity to provide additional context.

Digital Audio Journalism

The rapid growth of the Internet coupled with ever faster broadband connections and mobile data networks means traditional media—radio, television, and newspapers—are no longer the primary mechanisms of news delivery in the 21st century. While the web has changed the way audio reporters do their jobs, the fundamental tenets of audio journalism are still the same. In fact, audio itself is seeing renewed growth and interest with the rise of new digital media technologies.

Podcast Journalism

The concept of podcasting as we know it today originated in the early 2000s. Most early journalism podcasts were simply rips of radio feeds of news, sports, and entertainment features downloaded to a mobile MP3 player. By 2007, journalists from major outlets including the British Broadcasting Corporation, National Public Radio (NPR), and *The New York Times* were creating compelling and engaging audio content, but the reach of these podcast episodes initially was limited. In 2014, the syndicated public radio program *This American Life* broadcasts the first episode of *Serial*, a 10-episode podcast series, on-air in place of a regular *This American Life* episode. The producers encouraged listeners to subscribe to the *Serial* podcast and listen to additional episodes for free. The tactic worked; *Serial* quickly became the most downloaded podcast in history.

Serial's long-form storytelling approach resonated with listeners and the program won a Peabody Award in 2015. When presenting the *Serial* production team the award, the Peabody committee noted that the innovative approach utilized in the podcast's production had major implications to the way stories could be told in this new medium. The investigative journalism conducted in the production of the first season of *Serial* was quickly emulated and an entire genre of long-form nonfiction narrative-based true crime podcasts has since been released.

In 2017, *The New York Times* began production of the news podcast *The Daily*. Produced weekdays, *The Daily* calls upon vast resources of *The New York Times*, featuring interviews with staff reporters about the news topics of the day.

The podcast, usually 20–30 minutes, concludes with a brief summary of the day's news. *The Daily* immediately resonated with listeners and accumulated more than 100 million downloads in the first year of production. *The Daily's* success is attributed to the candid conversations between journalists about the day's news. Additional insight and context can be provided in the podcast that would not be possible in a printed version of the same story.

It is common today to see podcasts produced by ABC News, NBC News, the *Los Angeles Times*, *The New York Times*, NPR, and public radio stations such as WNYC and WBUR to have productions at the top of charts tracking the most popular podcasts by download. Podcasts have provided an innovative way for listeners to understand truth, reality, and current events and news departments spanning radio, television, and print are beginning to take advantage of this new approach to storytelling.

Smartphones and Mobile Journalism

The ubiquity of smartphones and high-speed cellular networks provides distinct advantages for today's audio journalist. Given the storage capacity of most modern smartphones, they can easily double as a digital audio recorder. If equipped with enough battery life and an external microphone appropriate for high-quality recording, there is no reason that an audio journalist on assignment needs any additional pieces of equipment. Further, several smartphone applications exist that allow for advanced editing and mixing. While more cumbersome than audio-editing software that can be used on a personal computer, these technologies afford journalists the ability to produce, edit, and submit stories entirely from the field, making high-quality, fully produced up-to-the-minute reports possible.

Today's Audio Journalist

Given the rapid changes in technology and the ever-shifting media landscape, today's audio journalists must be mindful that their work will most likely not be limited solely to audio. There is a blurring of lines between traditional media companies; television stations are producing podcasts

and newspapers have invested in video production departments. Audio-based outlets and the journalists who work for them are often required to file a web story to go along with any audio report they produce. In addition to still images, audio journalists are increasingly shooting video to integrate on social media. Large audio-based outlets are investing in web technologies to integrate data visualization applets into their websites. As technology changes and more tools become available, audio journalists remain, at their core, storytellers. The more tools they master to effectively tell stories, the more engagement they will have with their audience.

AUSTRALIA AND NEW ZEALAND

The neighboring countries of Australia and New Zealand in the South Pacific region share many similarities although in physical terms the two countries are significantly different. Australia is vast, 7 million square kilometers in area, much of

it sparsely populated semidesert. The population of 25 million mostly live in coastal cities, with each of the capitals of the six states containing at least half of their respective state's population. New Zealand, by contrast, is relatively small: 250,000 square kilometers covering two islands of almost equal area, well-watered, fertile, and mountainous. New Zealand's population of 5 million is more spread out, with the largest city, Auckland, holding less than a third of the national population.

However, as a result of history, economics, and personal connections, the journalistic cultures of the two countries are quite similar. This entry first discusses characteristics of the two countries that influence their media systems and journalistic practices before discussing the history of journalism in the two countries and present-day news media.

Where differences between the two countries' journalistic traditions are obvious, they are mainly due to the disparity in geographical size and population. In Australia's larger cities, especially Sydney and Melbourne, a competitive journalistic culture between several daily newspapers arose in the early 20th century. Both broadsheets and tabloids would compete for readers and advertisers, similar to the newspaper markets of London or the large American cities. By contrast, New Zealand's larger cities tended to have just one staid morning broadsheet newspaper, with a slightly racier afternoon publication, always separately owned. Australia's radio and television stations are mostly city- or state-based, whereas New Zealand radio is largely networked nationwide, and all television stations are national.

By the late 20th century, the rise of television, and the tendency of most workers to commute by private car, led to the demise of afternoon newspapers. For a brief period in the decade or so either side of the turn of the second millennium, each New Zealand city, and smaller Australian state capital, had just one daily newspaper. Sydney and Melbourne each had two, one a broadsheet and the other a tabloid, but there was plenty of advertising revenue to go around, largesse which one commentator called *rivers of gold*. Radio and television also thrived on advertising revenue, bringing constant changes and consolidation of ownership of stations in both countries. The

arrival of the Internet in the 1990s brought the first threat to that comfortable environment, and the loss of audience and revenue gained pace in the early 2000s.

Background

Australia's Aboriginal people first settled the continent by land from what is now Papua New Guinea some 60,000 years ago and had variegated into hundreds of language groups by the time the first Europeans arrived. New Zealand's Māori people arrived by sea from the central Pacific in the first centuries of the second millennium CE. Māori are closely related to the other Polynesians of the Pacific, such as those of Tahiti and Hawai'i, both ethnically and linguistically. The Māori language was spoken throughout New Zealand at the time of European exploration, with only minor dialectical variations.

Both countries' populations are now largely of European descent, with many of their ancestors having emigrated from Britain and Ireland, but much less so than in the middle of the 20th century. Immediately after World War II, Australia actively recruited immigrants from continental Europe, especially its south and east, making it much more multicultural than in earlier years. But due to an official "White Australia" policy, that was the limit of the cultural mix of its new arrivals, while Indigenous Australians were largely marginalized in the remote outback and small urban ghettos.

During the 20th century, New Zealand continued to take immigrants mostly from Britain, but also the islands of the Pacific. Both countries broadened their migration intake considerably in the 1980s and subsequent years, taking immigrants in big numbers from all over the world, but especially east and south Asia. According to the 2016 census, 90% of Australians were of European descent, but a third of residents were born overseas, and 3% were Indigenous. In 2018, two-thirds of New Zealanders were of European ancestry, with a quarter of the population born overseas, and Indigenous Māori making up 17% of the population. The close historical ties between the two countries mean there is free movement between them for their respective citizens: More than half a million New Zealanders live in

Australia, while some 50,000 Australians call New Zealand home.

Australia and New Zealand are now both prosperous, modern societies, with strong democratic governments and high levels of social capital, based on largely state-funded health care and education. They are both consistently highly rated in international surveys of “liveability,” ranking alongside Canada and the social democracies of Northern Europe. They both have a robust media sector based on a strong journalistic culture, with high levels of consumption of news in print, through broadcast, and online. But like the rest of the world, journalism in Australia and New Zealand, mostly funded by advertising, is facing strong challenges to its viability from digitization, the greater availability of offshore content from online providers, and the loss of advertising revenue to overseas digital providers. This prompted the Australian government to pass a law in early 2021 requiring Google and Facebook to pay Australian news providers for their content which the tech giants carry on their platforms.

The Australian and New Zealand economies are also closely linked, with a common market-style agreement, Closer Economic Relations in force since the 1980s. Large areas of New Zealand’s economy are owned by Australian companies, including retail, banking, and, most significantly, media. Some New Zealand companies also have large investments in Australia, but the flow of income is mostly in the larger country’s favor. These links have meant that there is a constant interchange of journalism practitioners between the two countries. Many of Australia’s most prominent journalists have been born in New Zealand, and many Australians also work in New Zealand, although they are outnumbered by New Zealanders who have spent time gaining experience in Australia, then returned home.

History of Journalism

The first newspaper in Australia, *The Sydney Gazette and New South Wales Advertiser*, was founded in 1803 and published for a further 39 years, initially under the stewardship of a convict, George Howe. It was a semiofficial publication of the New South Wales colonial government and was subject to official censorship for its first two

decades. In 1831, three Gazette employees founded the *Sydney Herald*, which became the *Sydney Morning Herald* 11 years later, and under that name is Australia’s oldest continuously published newspaper. Newspapers were founded in the other colonies in the 1850s, some of which are still printed today, although with name changes, such as the *Age* in Melbourne, the *Mercury* (Hobart), and the *Courier-Mail* (Queensland).

From the earliest days of Australian journalism, family dynasties of proprietors began to emerge. John Fairfax acquired the *Sydney Herald* in 1841, and the Fairfax family retained control of it and other newspapers in Australia’s eastern states for almost 150 years. In the early 20th century, two new dynasties arose, which between them dominated the Australian media industry for most of that century: the Packers and the Murdochs. They competed fiercely in print and television, but followed different long-term strategies. The Packers concentrated on Australia alone, diversifying into pay television and gambling before selling out of news media altogether in the early 2000s. Meanwhile, under the scion of the second generation of Murdochs, Rupert, the family bought up media outlets across the English-speaking world. Rupert Murdoch also founded the country’s first national newspaper, the *Australian*, in 1964.

All three family companies, and others, expanded into electronic media, with the Packers setting up Australia’s first television station, Sydney’s Channel Nine, in 1956. This made Australia unusual, in that television started under private ownership with populist, commercially funded programming, rather than with a state-owned public broadcaster such as the British Broadcasting Corporation or New Zealand’s NZBC. Australia’s equivalent of the BBC, the ABC, did not add television to its radio broadcasting fare until 1958. The addition of large numbers of television viewers to already avid newspaper readers and radio listeners gave the dynasts not only enormous financial income but also political power, with the endorsement of the Packer or Murdoch publications (television news was essentially apolitical) allegedly able to make or break governments. Both the Packer and Murdoch publications favored both major political groupings, the center-left Labor Party and the center-right Coalition, at various times. But both sets of publications more

often opposed Labor governments, or the party's attempts to win office, and backed the more business-friendly Coalition, both at the federal and state level.

New Zealand's early media, as befitting a much smaller country, were much more sedate. The first newspapers were founded in the middle of the 19th century, with some, such as Dunedin's *Otago Daily Times* and Auckland's *New Zealand Herald*, still appearing today. The mid-19th century also saw a number of Māori-language newspapers published, most notably *Te Karere* from 1842 to 1863 (with interruptions), while others stayed in print until the 1930s. Like Australia's early journals, New Zealand's were family owned, but did not expand to nationwide dynasties, rather taking on small town publications in their respective cities' hinterlands in an incremental manner.

Radio started under private ownership in the 1920s, but the stations were almost all nationalized by the first Labor government in the 1930s, and the resulting NZBC became the sole television broadcaster, starting in the largest city, Auckland, in 1960. Private radio only returned to the New Zealand airwaves in the 1970s, prompted by an offshore ship-based pirate station, Radio Hauraki, in the mid-1960s, itself inspired by the British pirates of the same era, such as Radio Caroline. Private television arrived in 1989 with TV3, but only after a long legal and political campaign by its backers, and soon found itself in financial distress, having underestimated the energy and innovation of its state-owned competitor, Television New Zealand, which had been put on a full commercial footing with the breakup of the NZBC in the mid-1980s.

New Zealand's tightly regulated media market started to open up with the repeal of the News Media Ownership Act in 1974. A process of consolidation of media properties then took place, first in print, then broadcast, as state-owned radio stations were privatized and new private stations launched. New Zealand's print sector is now dominated by two conglomerates, both in financial difficulties. Several attempts to merge them in recent years have failed due to political and legal hurdles, and one, Stuff, was sold in mid-2020 for \$1 to its employees, who also took on its liabilities.

Journalism in the 21st Century

Coverage of politics in both Australia and New Zealand is heavily focused on personality, popularity, and polls, with serious examination of policy struggling for print space and broadcast time, even during election campaigns. The political agenda is often influenced, and sometimes set, by radio "shock jocks," mostly right-wing, with backgrounds in general broadcasting rather than serious journalism. News coverage of politics, especially by the dominant Murdoch tabloids in Australia, can be quite partisan, mostly in favor of the conservative side of politics. New Zealand newspapers are less biased, with impartial news coverage. Even the endorsement of political parties (as in Australia, usually conservative) on the eve of elections largely disappeared with the switch to a proportional voting system in the 1990s. Both television and radio news coverage is also impartial, overseen by broadcasting standards authorities in both countries.

Both Australia and New Zealand are frequently listed at the top of international surveys of social development and democratization, and also for one of the key components of those qualities, press freedom. The international watchdog, Freedom House, in its 2020 survey rated Australia and New Zealand both at 97 in its Global Freedom Score, compared to Norway at the top with 100, and the United States at 86. The international journalists' organization Reporters Without Borders placed New Zealand ninth, on a par with the Nordic countries, and Australia 26th, 10 places behind Canada, but almost 20 above the United States, out of the 180 countries in its 2020 survey.

With no national newspaper in Australia until the 1960s, and none in New Zealand, news agencies took on a prominent role in the business of newsgathering and distribution. Each country had a monopoly operator: Australia Associated Press (AAP), founded in 1935, and the New Zealand Press Association (NZPA), founded in 1879. Throughout the 20th century, they were both profitable, highly professional, and productive, but fell prey to digitization and consolidation in the early 2000s. NZPA folded in 2011, and AAP looked about to close in 2020, but was reprieved by a last-minute staff buyout.

Although geographically isolated at “the bottom of the world” from a Euro-American viewpoint, both Australia and New Zealand have always been outward looking, drawing societal and cultural influences from overseas, initially Europe, especially the “mother country” of Great Britain, and after World War II, the United States. This also applied to news and current affairs, with weekly and monthly periodicals from the United Kingdom and the United States having devoted readerships in both Australia and New Zealand. An additional facet of “imported news” was the large readership for Australian publications in New Zealand.

Both the total number and social makeup of journalism workers have changed considerably in recent decades. As with all developed nations, there has been a steady decline in the total number of workers describing themselves as “journalists” in Australian and New Zealand national censuses since the turn of the 21st century, as well as a decline in membership of journalists’ professional associations and trade unions. The makeup of the profession has also changed. Many more women and ethnic minorities now work in journalism than 50 years ago, when it was overwhelmingly white and male. Just over half of journalists in both countries are women, but they tend to be younger and perform lower status roles than their male colleagues. But the proportions of people of color, especially members of the Indigenous minorities, in journalism are nowhere near those of the general population, and their share of jobs is even smaller in management and other highly paid positions.

The low representation of women and ethnic minorities in mainstream media in the late 20th century prompted some to found their own publications and broadcast outlets, with state assistance in the case of Indigenous broadcast media. While both Australia and New Zealand had a popular “women’s magazine” sector from the 1930s, such as the *Australian Women’s Weekly* and the *New Zealand Woman’s Weekly*, these were largely apolitical general interest magazines, framing women in traditional housewife roles. The first feminist press appeared in the 1960s, initially as semiunderground publications, but then adopted by the print conglomerates in the 1970s. Non-English-language newspapers serving

immigrant communities in Australia proliferated after World War II, as did ethnic radio stations. The Australian government founded a second public-service radio broadcaster, the Special Broadcasting Service, to serve ethnic communities in 1975, which expanded into television in 1980. It now broadcasts in 68 languages on radio and rebroadcasts news programs from around the world on television, as well as serving the Indigenous community through its National Indigenous Television (NITV) channel. In New Zealand, ethnic radio stations and print outlets have also expanded since the 1980s, as have Indigenous broadcasting ventures. The foundation in 1993 of a state-funded agency specifically to foster broadcasting in the Māori language led to the establishment of 25 iwi (tribal) radio stations, and in 2004, a Māori television service.

Journalists in both Australia and New Zealand face challenges from the state and corporate interests in freely supplying information to the public. Neither country has a law equivalent to the First Amendment of the U.S. Constitution, which guarantees freedom of speech and publication. In Australia, there have been several high-profile raids on media organizations by the federal police in recent years, seeking evidence of leaking of government information. Both countries have defamation laws that favor the plaintiff more than similar laws in other countries. This can have a “chilling” effect on news outlets and enforce a prior restraint on publication rarely seen in other jurisdictions, such as the United States. In New Zealand, full reporting of the courts of law is often hampered by sweeping suppression orders, especially of defendants’ names.

Journalists are not generally highly regarded by the general population in either country. A recent survey in New Zealand found positive public attitudes to journalists at only 23%, just a point higher than politicians, and around a quarter that of emergency workers such as firefighters and police. Historically, journalists in both Australia and New Zealand were trained on the job in the so-called *cadetships*, akin to an apprenticeship in manual trades. Although the first university-level journalism course in Australia started in the 1920s, widespread professionalization of the training of journalists did not begin in either country until the 1970s, initially with 6- to

12-month courses at trade training institutions, then development of full 3-year bachelor's degrees. More than half of the 43 Australian universities now have journalism courses, mostly as undergraduate degrees, although several also offer postgraduate diplomas, and one has a Masters of Journalism course. Journalism education is similar in New Zealand, with three of the country's eight universities and several polytechnics offering journalism training.

One area where the news media in both Australia and New Zealand are regarded as providing positive coverage that serves their communities is that of disasters, natural and man-made. Both countries have harsh environments, with Australia prone to devastating forest fires and flooding, and tropical storms, while New Zealand is geologically unstable, with regular earthquakes and volcanic eruptions. In addition, Australia and New Zealand each have suffered from rampages by lone gunmen, most notably the Port Arthur massacre in Australia in 1996 that killed 35 people and the Christchurch mosque shootings in New Zealand in 2019 that killed 51.

News coverage of disasters often emphasizes empathy and the importance of community, focusing on the role of political leaders as comforters and mourners-in-chief. Equally, leaders who are seen not to rise to those roles are the subject of strong public and media criticism, as the prime minister of Australia was when he was holidaying overseas during the devastating forest fires of late 2019. His reputation was largely redeemed by a much more empathetic performance, and favorable media coverage, in early 2020, as the coronavirus pandemic began to take hold. Similar "sensitive" coverage was also seen at the height of the coronavirus epidemic in early 2020, although both countries suffered relatively lightly compared to the rest of the world. Coverage in New Zealand particularly featured the unity of the "team of five million" (the entirety of the country's population) and the emphasis placed on "kindness" by Prime Minister Jacinda Ardern.

Both Australians and New Zealanders have traditionally been enthusiastic adopters of new technologies, and Internet usage grew rapidly after the introduction of the World Wide Web in the early 1990s. Commercialization of the Internet and professionalization of its news providers

spread, with both specifically online sites, and traditional media across all means of communication offering online content, including convergent content such as audio and video on the sites of newspapers, and text from legacy broadcasters. The international accessibility of the Internet also meant that many subscribers spread their news consumption to offshore sites, particularly in the United States and the United Kingdom. But the real effect on what had been the rich revenue streams for media companies in both countries was firstly, the loss of classified advertising to dedicated, easily searchable sites, especially those featuring listings for motor vehicle and real estate, then, with the arrival of search engines such as Google and social media platforms such as Facebook and Instagram, the migration of display advertising to those companies, made more attractive by data-driven targeting of consumers.

Australian print newspaper circulations have been steadily declining since the early 2000s. In 2005, the total weekday circulation of national, state, and territory capital city newspapers was 2.3 million. By 2018, it had almost halved, to just over 1.2 million. A similar sample in New Zealand, of newspapers in four of the largest cities, saw a more than 20% decline in just 2 years to 2019. Readership fell even faster, as the younger members of households ignored the daily paper, even if their parents still subscribed. Revenues, both from sales and advertising, plummeted, and the inevitable staff layoffs and closures followed.

During the same period, Australian television news also lost viewership. In 2008, 17 news or current affairs programs were in the top 50 most viewed in the state capitals, with a peak audience of 2.4 million. The last year news made it into the top 50 was 2018, with a single program at 50th position with an audience of 1.4 million. New Zealand television viewership has been stronger, with the two main news programs maintaining a collective audience of close to 20% of the population.

Crisis and Challenges

By the start of the third decade of the 21st century, the outlook for traditional media in Australasia was uncertain, with continuing falls in the numbers of readers and viewers, and ever-increasing

budgetary pressures. Some glimmers of hope were evident, with new online offerings based on traditional titles, some of them new entrants from overseas, such as the Australian web versions of the British *Guardian* and *Daily Mail* sites, as well as those locally produced. But an already weak media sector in both Australia and New Zealand was dealt a body blow in early 2020 with the arrival of the COVID-19 virus and the resulting lockdowns of a large proportion of economic activity. Advertising revenues shrank, and in New Zealand many publications could not go to print because of lockdown restrictions. The most notable casualty was the German-owned Bauer Media Group, which had acquired many of the most iconic weekly and monthly magazine titles in both Australia and New Zealand in the early 2000s. Its Australian properties were sold in mid-2020 for a large loss of both equity and jobs, while the New Zealand titles were sold to a range of corporate and individual buyers in late 2020.

AUTOMATION

In news production and journalism, automation can be divided into three broad areas: newspaper automation, in the area of layout and printing technology; broadcast automation, in the area of live directing and playback; and research/writing automation, in the area of news wire services and software for newsroom writing, collaboration, and editing. There has been a progression of convergence between these three aspects of automation as the technology of printing, broadcasting, and newsgathering continues to move further into electronic digital platforms, and older analog or physical formats become obsolete or artisanal. This entry discusses the origins and evolution of automation in the news industry, the implementation of automation in newsrooms, and uses of automation in the contemporary news industry.

Origins and Evolution of Automation

Throughout the 19th and 20th centuries, the process of typesetting, printing, and finishing newspapers and magazines became increasingly industrialized. The wide-scale application of

steam-powered engines and precision manufactured presses sped the printing process and shortened the time required between news deadlines and distribution of finished newspapers. The technical evolution of linotype, off-set lithography, rotary presses, and flexography allowed for both increasing sophistication of typography and visual components, as well as faster layout of individual print runs. Phototypesetting, also referred to as *cold printing*, was perfected in the 1940s and made the process of page layout faster while calling for increasing automation processes in editorial oversight and the mechanical processes of printing. Early digital technologies in the 1960s and 1970s such as Digiset and VideoComp used cathode ray tubes (CRTs) as the light source for phototypesetting. Design software developed during this period automated both page layout and editorial workflow.

Continuing alongside this mechanical industrialization was process automation, which decreased the need for individual workers in the mechanical process of printing. As these new printing technologies did not require metal type plates, the physical location of the printing presses could be moved away from the location of the newsroom and layout. Throughout the late 20th century, this process of automation again decreased the production time for daily and weekly printing. By the mid-1980s software programs such as PageMaker and Quark allowed for layout and design to be done using desktop personal computers. Simultaneously, the wide-scale adoption of word processing software allowed for full workflow automation of print journalism from reporters and editors through layout and printing. Newspaper automation also changed the style of layout, advertising, and content editing of newspapers and magazines.

The process of automation in research and newsgathering arguably began with news pools in the early 19th century and continued with the establishment of newswire services in the mid-19th century. Individual reporters and editors had access to basic factual information gathered by other on-location reporters not necessarily directly employed by the newspaper or broadcast network. Early news pool stories were gathered by editors and physically posted in newsrooms. Wire services grew in sophistication together with the

technology of telegraphy and later telephony and proto-Internet information services.

As wire stories were collected in newsrooms, stories could be assigned to reporters by editors. More importantly, text from the wire story could be integrated directly into the reporter's story. As information moved into newsrooms faster, the process of story assignment, research, and writing was increasingly automated. Wire services adopted Telex automation technologies in the mid-20th century, further speeding the process of newsgathering. Simultaneously, newspaper archives were cataloged using early electronic information storage and retrieval technologies allowing for fast, searchable databases of stories, topics, and newsbeats.

Together with electronic cataloging of public records, business information, and large academic libraries, the process of news research was increasingly automated using early database management software using a standardized programming language (e.g., COBOL) which allowed for early search functions by the 1980s using a standardized query language (SQL). Automation in news research and database search functions improved during the 1980s and 1990s with object-oriented database management, and moved online via open data formats such as HTML and XML.

The rise of radio and television broadcast networks in the early 20th century posed several logistical problems that were solved by automation. Among these problems were multiple live and playback sources, far tighter broadcast deadlines than print journalism, and the need to standardize the division of labor within broadcast facilities.

Early broadcast automation involved control of network switching and playback machines using simple electronic pulse control. This was further automated and standardized using SMPTE time code and network switching in television network newsgathering and distribution. (SMPTE is an abbreviation for Society of Motion Picture and Television Engineers, which developed the time code standard.) Networks and individual television stations adopted master clocks that generate a time code to which all playback and routing devices are synced. A central control device, usually a broadcast switcher can then control live elements together with playback. Broadcast

automation expanded in the 1980s and 1990s to include graphics character generators and robotic cameras.

As media production moved away from technologies relying on magnetic tape and became digital, playback devices began using standardized transfer protocols such as Transmission Control Protocol/Internet Protocol (TCP/IP) to ensure the compatibility of hardware and software. Newsroom computer systems used in the 1990s were split into those for production automation, such as the BASYS system for tape control, and those for workflow automation, such as scheduling software.

With the evolution into full news automation, wire stories, production rundowns, and finished stories can be acquired, tracked, and loaded from individual reporters and editors into a central computer server for access by the all members of the production team. Key to this process is the addition of metadata and tags to each piece of information. This metadata allows each operator to determine if the information is relevant to their production or news story. During live broadcasts, directors and technical operators can control all linked machines using a single protocol for moving information using open Internet of Things (IoT) technologies, and XML standards for data control. Video-over-IP (VoIP) technologies allow backpack journalism, which originally required a story to be edited and transmitted or uploaded to the studio but can now be delivered by live on-air reporters using cellular connections and automation software.

During automated playback, a central control system operates all playbacks, cameras, and other studio devices with limited personnel. Broadcast automation made possible the specific techniques needed for vast interconnected global broadcast news operations. Automation systems also allow for inexpensive redundancy and archiving of productions and a more intuitive graphic interface.

Implementation of Newsroom Automation

Many broadcasters and newsgathering operations adopted automation in phases. The first phase is automation of playback devices and cameras. The second is the automation of rundowns and story editing along with wire services and

teleprompters. The final phase is a complete switch to digital media and the addition of metadata to all media, stories, and rundown for control and oversight.

Newsroom automation has been resisted by some news professionals. Lisanne Bainbridge criticized the process in her article “The Irony of Automation” in 1983, noting the paradox that while more automation may reduce the number of workers in a system, it requires more attention from each worker and a higher level of both education and technical skill. Historically, it has been small and mid-sized newsgathering operations that first embraced news automation, and leveraged its benefits. Automation also evolved for simultaneous publishing to social media platforms, streaming services, podcast providers, and the use of RSS and other automatic syndication services. The BBC was an early adopter of these technologies and has made the RSS feed and archive searchable through its Juicer project, which allows for data visualization of large number sets.

Contemporary News Automation

Contemporary news automation takes many forms in digital research, editing, vetting, and even writing. The use of big data applications in journalism can be traced through early academic applications, then market research, then tagging and annotation of news sources, and finally for large data set analysis using artificial intelligence. The use of digital metatags in journalism began in the mid-1980s along with the rise of HTML and other hypertext-based organization. Although traditional journalism had used headwords and slug lines from the early days of mechanical printing, these new metatags could be easily accessed, sorted, and shared quickly by multiple individuals and across news publications.

Several national newspapers and chains began to utilize open-source applications for tagging articles, topics, and syntax structures from the mid-2000s. *The New York Times*’s Editor project made this process automated during the research and writing phases. *The Washington Post* created a Knowledge Map project involving automated metatagging to allow readers to follow articles and topics across years.

Automation has also been adopted in fact-checking, editorial oversight, and vetting of news sources. Recurrent neural networks are several artificial neural networks working in tandem to look at large data sets over time and predict specified patterns in very large data collections. In the case of automated vetting and fact-checking, these neural networks can be designed to detect the syntactic and narrative patterns of satire, hoaxes, and misinformation. As more and more journalists and editors come to rely on social media platforms to locate and investigate breaking news stories, these neural networks are frequently used to determine the likelihood of rumor, public relations spin, and misinformation before making a decision to further investigate a story. Very similar neural networks are used for speech-to-text automation that can be used for audience accessibility and by journalists as a means of input to replace transcription.

By the late 1990s, financial newswires were using automation and artificial intelligence to locate patterns in their databases of articles and financial data and produce journalistically useful information. These practices led to the evolution of data journalism and data visualization in the mid-2000s and their use in areas such as political polling and sports handicapping. Data journalism and data visualization rely on automation and artificial intelligence to analyze data before the narrative of the news story emerges.

The website FiveThirtyEight began as a sports data reporting publication using the automated Sabermetrics data analysis for baseball and other professional sports statistics. The creator, Nate Silver, used automated sports handicapping software applications to compare multiple political polls during the 2008, 2012, and 2016 U.S. presidential campaigns. In 2012, the site was licensed by *The New York Times*, and in 2013 it was purchased by ESPN. In 2018, the site was acquired by ABC News, although FiveThirtyEight was expected to continue participating in ESPN's sports coverage along with continuing to cover economics, politics, and other topics. Both ABC News and ESPN are divisions of the Walt Disney Company.

Starting with the use of automation and artificial intelligence for aggregation and data analytics, many news providers have begun to use the same system for automated writing of short

recaps, news blurbs, and summaries. Some news organizations have begun experimenting with the use of neural networks to create narrative stories based on data sets. Automatic writing, sometimes called *robot journalism*, has been used to automate the story research and writing for minor league sports, local government and zoning decisions, and real estate and small-transaction financial information. The Associated Press began using technology from Automated Insights to produce earnings report stories in 2014, and in 2016 the wire service announced it would use the same technology to cover minor league baseball games. In 2014, the *Los Angeles Times* began publishing preliminary articles on earthquakes written by a software application it refers to as Quakebot, which uses data from U.S. Geological Survey sensors. A *Times* employee looks over each Quakebot article before it is published, and when an earthquake is significant reporters add more context to the article after it is first published online. The initial Quakebot articles sometimes reflect errors in the data the software application receives, sometimes with dramatic results: In 2017, Quakebot reported on a magnitude 6.8 earthquake from 1925 as though it had just occurred. *The Washington Post* began using its in-house artificial intelligence technology, Heliograf, in 2016 for short articles on the Rio Olympics, and subsequently used it for Election Day reports and to cover Washington, DC-area high school football games.

Virtual assistant and chatbot technologies are expected to begin playing a larger part in the automation of research, writing, and editorial oversight as well as news aggregation and consumption. The long-term trend in automation will likely involve the blurring of boundaries between authorship by humans and that by machines and artificial intelligence. In 2016, several news publications, including the *Guardian*, began experimentation with chatbots over Internet messaging systems (e.g., Facebook Messenger, WeChat) to create daily briefings and news digests for subscribers based on the technology used for newsroom automation, blurring the line between creation and consumption of news.

B

BANDWAGON JOURNALISM

Bandwagon journalism is when journalists follow the actions and storylines of other journalists or broad trends in media coverage as a result of journalism habits, mores, and culture. The term often refers to political news coverage, although the topic of coverage can vary, and it is often meant as a pejorative. The term is not widely used today, though *pack journalism* is still heard and has a similar meaning. This entry discusses the background of the term, its application to journalism, and its evolving usage.

Background

The term takes its name from the late 19th-century bandwagon, a large wagon pulled by draft animals that was part of political processions, sometimes even carrying a band and political figures. The term also refers to circus bandwagons, which carried circus animals, musicians, and supplies. To jump or hop on the bandwagon indicated one's willingness to join the winning political side or the side appearing to have momentum.

Bandwagon journalism should not be confused with the bandwagon effect in public opinion research. The bandwagon effect suggests voters are influenced in an election by their perception of which side is winning. The bandwagon effect holds that there is pressure on some audience members to alter their opinions to be in agreement

with those enjoying greater support, renewed interest, or greater enthusiasm for their cause.

Application to Journalism

Bandwagon journalism describes the behavior of journalists who, broadly speaking, appear to be following the lead of other journalists in their news coverage. In this way, bandwagon journalism is sometimes used interchangeably with the term *pack journalism*, which is the tendency of journalists to concentrate on the same stories and storylines. The term *pack journalism* originated in the 1970s and is now more widely used and understood than bandwagon journalism.

Bandwagon journalism differs from pack journalism by the emphasis on the reasons why the coverage looks the same across media outlets. Bandwagon journalism is when journalists cover a political candidate or social movement because it is seen to have momentum and growing support. One example of this is when a political candidate is considered likely to win political office and therefore attracts more news coverage than other candidates. Bandwagon journalism suggests that journalists react to political momentum by concentrating their coverage on the candidate who is benefiting from that momentum. Often this coverage is considered more favorable than that accorded others in the race.

At the same time, the favorable news coverage prompted by the bandwagon can be short lived. Once a candidate has moved to front-runner status or has received greater attention in the news,

journalists may resume a more critical “watch-dog” stance in their coverage.

Thomas Patterson has pointed to what he sees as the opposite of the bandwagon, the “losing-ground” candidate. When a candidate is seen to have lessening support in polls or a campaign in disarray, news coverage becomes steadily less favorable. In this case, the losing ground bandwagon takes place as journalists follow the lead of other journalists in writing about problems within the campaign and the likely loss of the election.

Several scholars have focused on examples of bandwagon journalism in presidential primary news coverage, which can move negative to positive nearly overnight and thrust candidates into the spotlight or consign them to also-ran status. A candidate perceived to be winning enjoys more coverage that is more positive. An example in recent history is the news coverage of Democratic presidential candidate Howard Dean during 2003. Dean was the front-runner and presumptive nominee after raising more money than expected and engaging his supporters online, which was fairly new at the time. Polls predicted a victory, but his electoral support was thin and he quit the race a month after the first caucuses in Iowa in January 2004, never having won a caucus or primary. The criticism of bandwagon journalism was also made of the press coverage of Barack Obama, especially the 2008 presidential campaign. Critics argued that campaign coverage was disproportionate and overly positive because of the consistent lead Obama had in the polls, his charismatic candidacy, and the possibility he would make history as the first Black president.

Not all bandwagons are related to political campaigns. The U.S. media was criticized for bandwagon journalism prior to the 2003 Iraq War because of their failure to challenge false claims that Iraq had weapons of mass destruction. There was broad political and public support for the war in the aftermath of the September 11, 2001, terrorist attacks.

Sometimes the pressure is more overt. Bandwagon journalism has been used to describe self-censorship, journalism uncritical of government corruption, and blind support for those in power. For example, journalists and historians use the term *bandwagon journalism* to describe the lack of critical coverage of government corruption in

the domestic media of certain Latin American countries in the 1970s and 1980s. In this example, the pressures to jump on the bandwagon might include government closing media outlets or political violence.

The term pack journalism centers more on journalists’ behavior in relation to each other. It is promoted by journalistic norms that reward reporters for obtaining “scoops,” or exclusive stories, and even more importantly, not being scooped by others. Journalists thus practice what has been called *defensive journalism*, or covering events mostly to preclude a competing media outlet from obtaining an exclusive. This practice discourages journalists from reporting on their own and encourages them to stay close to their competition. It may happen more often when journalists are forced to work closely together, such as during political campaigns or legal trials, where reporters may travel together and work side-by-side for long periods of time. The term pack journalism takes its name from journalists moving in a group (or pack) while covering a story.

Both pack journalism and bandwagon journalism share this tendency of journalists to adopt similar storylines in news coverage and to be unwilling to deviate from the accepted wisdom of the current coverage. Journalists may be risk averse, and shy away from coverage too dissimilar from their colleagues to avoid criticism. The same thing may take place among editors or broadcast producers who must compare journalists’ output with that of other news sources. In doing so, both reporters and their editors or producers push coverage to greater sameness. The effects of both bandwagon and pack journalism are the same: similar news content from similar sources centered around widely accepted storylines. However, the reasons for this coverage differ between the two.

In common usage, the phrase *bandwagon journalism* is generally a pejorative. Occasionally, the phrase *bandwagon journalist* is used with the same intent. The terms are often a criticism of news media coverage or the behavior of journalists, and often used in a broad, general way. The terms suggest reporting that is lazy, unthinking, and shackled by journalism habits. They are often used by one side in a political race to downplay the reporting of the other side.

Evolving Usage

The evolving nature of journalism has influenced how we think of bandwagon journalism in several ways. Some critics have suggested bandwagon journalism in the 21st century is driven by easy Internet access to enormous information resources. Immediate access to prior media coverage encourages the repetition of sources, themes, and story lines, and sometimes even rumors and errors. The decline in the number of journalists at many media outlets suggests fewer media voices and less original reporting. Journalists with less time may feel pressure to follow common storylines. In addition, blogs and social media have challenged the definition of a journalist and professional practice more broadly. Untrained citizen journalists may amplify the echo chamber for a bandwagon, or may provide a new perspective outside the limitations of journalists' habits and practices. These changes suggest the criticism of bandwagon journalism will continue.

BANGLADESH

This entry provides a brief overview of journalism in Bangladesh. It starts with a country profile and background. After presenting the early beginnings, it traces the development of journalism practice during the periods of state control, market liberalization, and digitization. It ends with a

presentation on journalism education and challenges in the profession of journalism in Bangladesh.

Background

Bangladesh is a nation situated on the Ganges River (Padma) delta on the Bay of Bengal in South Asia. It is surrounded by India (in the west, north, and east) and has a border with Myanmar in the southeast. The southern part of the country opens up to the Bay of Bengal. With a population of 168.1 million (2019 estimate of the United Nations Population Fund) and a territory of 147,570 square kilometers (55,598 square miles), it is the world's most densely populated country. The major religion is Islam (90%), followed by Hinduism (9%). Other religious groups in Bangladesh include Buddhists, Christians, and Animists.

According to the World Bank, in 2017, the life expectancy in the country was 72.43 years and the per capita income was US\$1,563.99. Around 98% of the population speak Bengali as their first language, making Bangladesh the only monolingual country in South Asia.

Bangladesh was part of British India during the colonial period, which lasted 190 years. In 1947, before its withdrawal, the British partitioned the subcontinent along religious lines in a hastily drawn up arrangement. Two countries then emerged: India (mostly Hindu) and Pakistan (mostly Muslim). Pakistan initially consisted of two parts: West Pakistan and East Pakistan, which later became Bangladesh. Historians likened Pakistan to an experiment given that the two territories were separated by 1,500 km of Indian land. Consisting largely of raw material producing regions as well as having a nonlocal civil service, East Pakistan became the subordinate partner to its western counterpart. It faced internal economic exploitation and attempts to suppress its mother tongue. In 1971, East Pakistan fought to gain its freedom. The Liberation War resulted in the independence of the People's Republic of Bangladesh with Sheikh Mujibur Rahman as its founding father.

Soon after independence, Bangladesh spent 15 years under military rule until 1991, when parliamentary government was restored. Its economy has been growing rapidly since 2000 and it has

seen gains since then on the United Nations Human Development Index. In 2015, the World Bank reported that Bangladesh was among four formerly low-income countries that had become lower middle-income countries. However, it still beset with myriad problems such as poverty, unemployment, city and foreign migration, inadequate health facilities, poor transportation, family disintegration, and religious discrimination. The United Nations Development Programme identified fundamental challenges facing the country such as rapid industrialization, structural change, and substantial rural–urban migration. Environmental problems have remained significant and are expected to worsen as a result of climate change.

Beginnings of Journalism

The origin of journalism may be traced to British colonial times. In the late 18th century, *Hicky's Bengal Gazette* (which was in English) was published in Kolkata. This weekly publication was the first modern newspaper in the Indian subcontinent. In 1818, Bengali newspapers started to appear—the monthly *Digdarshan* (1818), the weekly *Samachar Darpan* (1818), and the weekly *Bengal Gazette* (1818).

In 1947, after British rule and with the partition of the Indian subcontinent, there was a lack of newspapers and broadcast facilities in Pakistan. However, newspapers that catered to Muslim readers soon transferred their operations from India. In East Pakistan, *Dainik Azad* (Daily Freedom) shifted from Kolkata to Dhaka in 1948. In 1949, an English daily the *Pakistan Observer* (renamed as *Bangladesh Observer* after independence in 1971) was published from Dhaka. Two other newspapers, *Dainik Sangbad* (Daily News) and *Dainik Ittefaq* (Daily Unity), were established in 1949 and 1953, respectively. These four dailies are regarded as the pioneers of the national press system.

Also, after British rule, there were only three radio stations located in Pakistan (Dhaka, Lahore, and Peshawar), which were a legacy of All India Radio. The radio broadcasting service was called Pakistan Broadcasting Service and in 1948, was renamed as Radio Pakistan. The Radio Pakistan Dhaka Centre started airing

from a house in Nazimuddin Road (located in the older part of the capital). In 1960, it moved close to Dhaka University in a building constructed specifically for broadcasting purposes. East Pakistan's first television station was launched in 1964 as part of the Pakistan Television Corporation. The corporation's objectives included disseminating information, entertaining, improving education, and motivating people to take part in developmental efforts. Both the radio and television stations were established based on the British Broadcasting Corporation model of public broadcasting.

Period of State-Controlled Media

After Bangladesh gained independence in 1971, the Bangladeshi press enjoyed some democratic space given the constitutional guarantee of freedom of expression. However, after consolidating its position, the new government increasingly became intolerant of criticisms from the press. The Printing Press and Publication Act of 1973 was then enacted to give the district magistrate the power to grant permission to publish newspapers, magazines, and so on. When Sheikh Mujibur Rahman imposed a one-party presidential system, he banned all newspapers except the four pioneers of the national press system. However, these newspapers were placed under strict government control and management.

In 1974, the Press Council Act was passed; the law established the Bangladesh Press Council with the authority to restrict the media, including the power to censor. With the change in government in 1975, more newspapers were given licenses to operate. Generally, the authoritarian regimes that followed continued the policy of strict censorship and regulation. Any newspaper critical of military rulers was closed down.

The state-run radio (renamed as Bangladesh Betar) and television (called *Bangladesh Television*) were extensively utilized as propaganda tools. During the one-party presidential system, state-run radio and television praised the achievements of national leaders. The succeeding military governments influenced broadcasting stations in an attempt to either sway the news or intimidate the broadcasters. In many instances, radio and television newsrooms were visited personally by

government ministers to ensure that the official line was followed.

Era of Market Liberalization

In 1990, Bangladesh became a democratic country once again. Soon after, economic reforms followed, which included the adoption of free market economic policies and the privatization of state-owned enterprises. With the change in the political and socioeconomic system, the private sector began to grow. This had positive implications for the newspaper and broadcast industries as wealthy businessmen invested in the media for the sustainability of their enterprises. These included large conglomerates such as Beximco, Globe, Karnaphuli, Transcom, Jamuna, Ha-meen, Bashundara, Gemcon, and Kazi Farm Group. These business groups targeted the burgeoning middle class as potential consumers of their products and services and accordingly expanded media holdings and advertisements to reach them. In addition, many of these conglomerates had either direct or indirect political interests.

As a result, there was a change in the nature of Bangladeshi media. In the past, the media were owned by the government and political parties. They propagated the ideologies of political parties, focusing on daily events and political analysis. News actors were mainly politicians. After market liberalization, corporate houses started dominating the media. With this, media reported on political issues as well as business matters and social activism. They diversified news genres and included investigative news and opinion columns. News actors consisted of politicians, business people, experts, nongovernmental organization activists, and civil society members.

The media likewise expanded its audience. AC Nielsen Bangladesh reported in 2005 that newspapers reached 24% of the population (48% in the urban and 16% in the rural areas), while magazines reached 6% (13% in the urban and 4% in the rural areas). Radio covered 22% of the population (16% in the urban and 25% in the rural areas), while television covered 64% (88% in the urban and 56% in the rural areas). In 2010, the Ministry of Information reported the number of media outlets as follows: 292 daily newspapers,

125 news weeklies, 23 private satellite television channels, two government-owned television channels, four private FM stations, one government-owned radio station, and 14 community radio stations to be in operation in the country. Competition among media outlets to reach the population and influence the public agenda has become very intense.

Rise of Digital Journalism

In 2005, Bangladesh became connected to the information superhighway via the SEA-ME-WE 4 submarine cable, which costs US\$35.2 million. As a result, there was a reduction in internet connectivity charges—leading to the expansion of digital media. It then became possible to launch a Bengali blogging site known as *Somewhere in... blog* in December 2005. The following year, the Norwegian telecommunication company Telenor opened 500 community information centers, which brought internet access to the rural areas. In the urban areas, internet cafes started to mushroom. After winning the December 2008 elections, the Awami League set out to fulfill its slogan “Digital Bangladesh.” The government advanced the conceptual development of “Digital Bangladesh” and published three documents on building an information society—*Digital Bangladesh Strategy in Action*, *National ICT Policy 2009*, and *Strategic Priorities of Digital Bangladesh*. These documents set into motion the roadmap for Bangladesh’s ICT development.

With this roadmap, access to the internet in the country drastically improved. The Bangladesh Telecommunication Regulatory Commission (BTRC) reported that in 2000, only 0.07% of the population could access the internet. By 2015, the figure increased to 14.40%, and by 2018, it was 56.3%. The astronomical increase was due to mobile internet usage estimates. According to the Bangladesh Telecommunication Regulatory Commission’s November 2017 report, there were 143.106 million mobile phone subscribers. Among them, 74.736 million people used internet. Most of them spent a majority of their time online using social media, with Facebook the most popular site. As of 2017, there were approximately 25–30 million Facebook users in Bangladesh, with 72% of them male and 28% female.

With these advances in internet access, news websites (which catered to the urban educated youth) grew in popularity. The first news website is bdnews24.com, which features content free of charge in both Bengali and English. Established in October 2006, it is among the most visited websites in the country with an estimated 120 million page views per month. With the success of bdnews24.com, more news sites were established. Among these, the largest were bd24live, banglanews24, and banglatribune. Moreover, the print media started producing their own online versions. Among the Bengali newspapers were the *Prothom Alo*, *Bangladesh Protidin*, *Dainik Jugantor*, and *Kalerkontho*. Among the English newspapers were the *Financial Express*, *Daily Star*, *Independent*, *New Age*, and *Dhaka Tribune*. Media houses have begun to place more emphasis on new journalism skills such as video editing, mobile journalism, online journalism, live reporting, multiplatform writing, newsgathering, fact checking and search engine optimization.

Advent of Journalism Education

Akin to other countries, the training of journalists in Bangladesh started out informally, that is journalists learned on the job. Media houses later on saw the need for hiring people with more high-end skills and a holistic educational background. Hence, the first journalism program was established in 1962 at Dhaka University. In 1991, a second program was set up at Rajshahi University. Two years later, a third program was introduced by a private university, the Independent University of Bangladesh.

By the end of 2018, a Deutsche Welle Akademie Study listed 18 journalism and media-related programs in the country—nine from private and another nine from public universities. Among public universities, Chittagong University had the most students, with 370. Among private universities, the University of Liberal Arts Bangladesh was the largest with 770 students. In total, there were 4,509 journalism and media students in the country—52.8% coming from the private universities and 47.2% from public universities. Aside from universities, journalists get their training from institutes, which conduct postgraduate diploma programs and certificate courses. These included the

government-owned Press Institute Bangladesh (established 1976), National Institute of Mass Communication (established 1980), Management and Resources Development Initiative (established 2001), and Bangladesh Institute of Journalism and Electronic Media (established 2003).

Challenges in Journalism Practice

Three challenges facing journalists in Bangladesh are gender bias, job security and compensation, and safety and security.

Gender Bias. Several studies have depicted the challenges of women journalists in Bangladesh. These issues included being highly outnumbered by men in the profession, with the male:female ratio in entry-level positions estimated at 5:1; a lack of women journalists in leadership capacities, with the male:female ratio in decision-making roles estimated at 85:15; being allowed to only cover “soft” beats such as lifestyle and entertainment; and being unable to stay long in the profession (57% of women leave in their third year at work).

Job Security and Compensation. The 2019 Deutsche Welle Akademie Study showed that many journalists were pessimistic about their journalism careers given job insecurity, low salaries, and lack of financial incentives such as housing and transport allowances. There was a lack of standards regarding the compensation, regularization, and promotion of journalists among the media houses. Only a few media houses have written human resource policies, procedures, and guidelines.

Safety and Security. In the 2019 World Press Freedom Index, Bangladesh ranked 150th—dropping by four places from 2018’s 146th. Undertaken by Reporters Sans Frontieres (Reporters Without Borders), the index annually reviews 180 countries and their relationship with the media. One reason for the drop in ranking was the Bangladesh Digital Security Act 2018. Amnesty International warned that the law imposes restrictions on the freedom of expression, fueling a heightened level of fear among journalists.

BERNAYS, EDWARD L.

Edward Louis Bernays, among the early leaders in public relations, advertising, and propaganda, is often referred to as the “father of public relations.” Known for linking the theories of psychoanalysis and the practice of public relations, Bernays effectively popularized techniques that influenced public opinion and changed consumer behavior, as described in the sections that follow.

In 1935, *Time* magazine proclaimed Bernays as “America’s #1 Publicist.” Bernays published several notable books such as *Crystallizing Public Opinion* (1923), *Propaganda* (1928), *Public Relations* (1945), and *The Engineering of Consent* (1955). *Propaganda* has been seen as a code of ethics for the profession of public relations, and *The Engineering of Consent* includes an eight-part formula that is widely utilized in modern public relations campaigns. These steps include 1) define objectives, 2) conduct research, 3) modify objectives based on research findings, 4) develop a strategy, 5) create themes, symbols, appeals, 6) create organization to execute strategy, 7) develop tactics, and 8) carry out plans. In *Crystallizing*

Public Opinion (1923), Bernays discusses how to identify and capitalize on heightening trends. He also oversaw the English translation of his famous uncle Sigmund Freud’s *Introductory Lectures on Psychoanalysis*, a compilation of talks delivered by the pioneering analyst in Vienna between 1915 and 1917 that examined the relationship between the unconscious and conscious domains of the human psyche. Bernays also taught the first public relations university course at New York University in 1923.

Genealogy, Education, and Early Career

Edward Louis Bernays (November 22, 1891–March 9, 1995), of Austrian-Jewish descent, was born in Vienna and died in Cambridge, Massachusetts. At 1 year of age, in 1892, Edward moved with his family to New York City. He was one of five children of Ely Bernays and Anna Freud Bernays, sister of psychoanalyst Sigmund Freud. His father’s sister, Martha Bernays, was married to Sigmund Freud, making Edward Bernays a double nephew through both parents’ families of origin. In 1922, Bernays married Doris E. Fleischman, a childhood friend and a staff writer for his firm, with whom he would have two daughters, Doris Held and Anne Bernays. Once married, Fleischman and Bernays were equal partners at the firm of Edward L. Bernays, Counsel of Public Relations.

In February 1912, Edward Bernays graduated from Cornell University with a degree in agriculture, a career path heavily decided by his father, Ely Bernays, who believed that rural development was an important path for America’s future. Edward, however, who detested agriculture, chose instead to pursue a career in journalism and became a writer for the *National Nurseryman Journal*. Eventually, he became a medical coeditor for the *Medical Review of Reviews* and the *Dietetic and Hygienic Gazette*, two monthly journals owned by Bernays’s father. It was during this time that the persuasive techniques developed by Bernays to sway public opinion emerged.

Creative Press Agent and World War I Involvement

Two months into his editorial position, Bernays and his coeditor, Fred Robinson, were hired to

promote a play titled *Damaged Goods*, which addressed a topic that was taboo for its time—sexually transmitted diseases. Eugene Brieux's play—which was about an engaged man who contracted syphilis from an affair but decides not to disclose this information to his fiancé—provided Bernays an opportunity to creatively promote a controversial topic. Specifically, Bernays's strategy included reframing what once was a taboo topic into an opportunity to inform the public about venereal diseases. For example, Bernays created a *Medical Review of Reviews* sociological fund committee consisting of notable individuals such as John D. Rockefeller Jr., Mrs. William K. Vanderbilt Sr., Mr. and Mrs. Franklin D. Roosevelt, and Reverend John Haynes Holmes of New York's Unitarian Community Church to endorse the play. He believed that soliciting the approval and testimonials of notable public role models would be an effective strategy in swaying public opinion. The play became a huge hit and was even performed before Supreme Court justices, members of the president's cabinet, and congressional representatives.

As a press agent in the arts, Bernays also found success promoting other theatrical productions such as *Daddy Long-Legs* and the U.S. tour of Russian impresario Sergei Diaghilev's *Ballet Russe*. *Daddy Long-Legs*, a play about a 12-year-old girl who goes to an orphanage, was successfully promoted by linking the play to a worthy cause. Bernays's technique included collaborating with New York's State Charities Aid Association to generate funds for orphans. This proved fruitful as colleges and high schools began to raise money for orphans. In addition, 10,000 *Daddy Long-Legs* dolls were manufactured, with proceeds going to the Aid Association. With Diaghilev's *Ballet Russe*, Bernays was tasked with promoting ballet during a time when the United States was not very knowledgeable about European culture and skeptical about seeing male ballet dancers dressed in tights. This opportunity led Bernays to conduct public opinion research in order to obtain information on what the United States understood about ballet during that time. Results from public opinion research assisted Bernays to effectively write—under the pseudonym of Aybern Edwards—promotional pieces for *Vanity Fair* and run promotional materials in *Ladies Home Journal* to

educate and alter the public's opinions about ballet. Additionally, Bernays also strategically transformed the principal ballerina in the production, Flores Revalles, into a national celebrity. Bernays was also able to generate additional publicity by having a seductive photo shoot featuring Revalles posing with a snake wrapped around her body at the Bronx Zoo. The stunt proved successful, and Revalles became a national celebrity; the pet snake was used as her trademark.

After his success as a press agent in the arts, Bernays attempted to enlist in the military when the United States declared war on Germany, but he was rejected for medical reasons. Undeterred, Bernays attempted to demonstrate his commitment to World War I in unconventional ways, such as volunteering to sell U.S. bonds and war savings stamps and promoting rallies to recruit individuals for the military. Eventually his publicity tactics earned Bernays an opportunity to become involved with the Committee of Public Information (CPI), also known as the Creel Committee. The Committee of Public Information, created by President Woodrow Wilson to influence the general public to support U.S. participation in the war, was an independent committee consisting of George Creel, Robert Lansing, and Josephus Daniels. Utilizing similar techniques from his experiences as a press agent, Bernays was successful in changing public opinion on United States involvement in World War I.

Notable Campaigns

In 1928, George Washington Hill, President of American Tobacco Company, hired Edward Bernays to promote Lucky Strike, America's fastest-growing brand of cigarettes, to the female population, which, at the time, accounted for only 12% of the market share. Several notable campaigns emerged from Bernays's involvement and success with Lucky Strike that other cigarette companies began to use similar persuasive tactics such as linking the product to a cause or belief. In the first Lucky Strike campaign, known as the Anti-Sweet Smoking campaign, Hill wanted Bernays to increase cigarette sales among the female population by creating a relationship between weight loss and cigarettes by using the slogan "Reach for a Lucky—instead of a sweet." Bernays's tactic, which he called *crystallizing public*

opinion, included creating and accentuating a “get-thin” trend by having “experts” and members of the press commenting on the appeal of thinness. Various photographers and artists, including Bernays’s photographer friend Nickolas Muray, were convinced to provide testimonials on the positive effects of being slender. Fashion editors also began publishing photos of haute couture-wearing slim Parisian models while news editors reported on expert medical testimonies on the benefits of smoking. For example, a former chief of the British Association of Medical Officers of Health put out a public health warning about the correlation between tooth decay and consumption of sweets. Specifically, Dr. George F. Buchan suggested that individuals should finish their meals with a cigarette instead of desserts. Bernays also strived to normalize cigarettes by elevating their everyday use to that of a household staple, similar to coffee. For instance, he urged homemakers to employ kitchen cabinetmakers to build physical spaces to hold cigarettes and encouraged hotels to include cigarettes on their menus. These tactics proved to be successful, as a letter from Hill to Bernays revealed that by December 1928, sales revenues for Lucky Strike cigarettes had risen by \$32 million.

In addition to successfully changing attitudes regarding the social taboo of female smokers, Bernays was next challenged to popularize outdoor smoking among females. Known as the Torches of Freedom campaign, Bernays used psychoanalysis to achieve insight into consumers’ motivation and insight and consulted with psychoanalyst Dr. A. A. Brill, a disciple of Sigmund Freud. Brill advised that a link between smoking cigarettes and women’s liberation could be made by promoting cigarettes as a social symbol of freedom from oppression. On March 31, 1929, Bernays coordinated an Easter Day parade featuring prominent females lighting “torches of freedom” as they walked down Fifth Avenue.

While Bernays was successful at changing societal taboos regarding female smokers, he also needed to strategically popularize the Lucky Strike brand to appeal to female smokers. Market research had indicated that the color green found on Lucky Strike packaging was unpopular among females. Bernays attempted to make green a fashionable color by targeting the fashion and

accessories industry. Tactics included hosting a Green Ball at the Waldorf-Astoria Hotel that was attended by leading debutantes, each wearing green, which was hosted by Mrs. Frank A. Vanderbilt, chairwoman of the Woman’s Infirmary of New York. Bernays also had fashion magazines such as *Vogue* run advertisements featuring fashionable green-colored Parisian dresses. A Color Fashion Bureau, created by Bernays, also sent out 5,000 announcements about the appeal of green to various department stores and merchandise managers. Thus, his third campaign for Lucky Strike demonstrated that through repetition of an idea, such as redefining the color green as fashionable, Bernays was able to positively change attitudes among female smokers about the packaging on the Lucky Strike brand.

Similar persuasive tactics were also crafted for Beech-Nut Packing Company. As America’s eating habits changed after the Industrial Revolution and the simple slice of toast breakfast or packaged cereal became popular, Beech-Nut Packing Company seek Bernays’s expertise to increase their bacon sales. Through Bernays’s strategic use of endorsements from doctors on the importance of a hearty breakfast, he was able to persuade the public that a bacon-and-eggs breakfast was a staple of the all-American diet.

Political Campaigns

Prominent political figures also solicited Edward Bernays’s expertise in influencing public opinion during election campaigns. In 1924, President Calvin Coolidge hired Bernays as a media advisor to assist with reshaping the president’s stiff image. Bernays suggested a breakfast meet-and-greet with the country’s leading celebrities at the White House and created one of the first publicity stunts for a U.S. president, known as the “pancake breakfasts.” Bernays also arranged for a White House concert featuring entertainers Al Jolson, Ed Wynn, The Dolly Sisters, Buddy deSylva, and approximately 40 Broadway performers. The *New York Times* reported the following headline: “Actors Eat Cake with the Coolidges . . . President Nearly Laughs.” President Coolidge subsequently defeated Democratic candidate John W. Davis, with 382 to 136 electoral votes.

Impressed with Bernays's success with Coolidge's campaign, Herbert Hoover hired Bernays to help with his 1932 presidential reelection campaign against Franklin Delano Roosevelt, then governor of New York. President Hoover was challenged with a depressed economy during his reelection efforts. Bernays's first persuasive tactic included the creation of a nonpartisan fact-finding committee consisting of 25,000 disinterested thought leaders, who suggested that the economic outlook was not as bleak as it appeared. Hoover lost, however, to Roosevelt, who offered the economic "New Deal" and won 472 electoral votes to Hoover's 59.

Other notable political figures who worked with Edward Bernays include Thomas E. Dewey, two-time presidential nominee for the Republican Party; first lady Eleanor Roosevelt and General Dwight D. Eisenhower, who would succeed Harry S. Truman as president. Notable government campaigns included a national campaign for the War Department to find employment placements for veterans. In addition, under President Hoover, Bernays created the President's Emergency Committee for Employment, which helped U.S. citizens who were out of work during the early years of the Great Depression.

Propaganda and Politics

Bernays was highly successful in political campaigns because he understood the importance of appealing to the emotions of the public. In *Propaganda*, Bernays explains that three elements of emotional content are needed for a political campaign to be successful. First, he proposes that emotional content must coincide with all aspects of a campaign. For example, emotions must emerge both during large mass meetings and appear in the finer details of a campaign such as the candidates being photographed with children. Second, Bernays contends that emotional content in a campaign must be adaptable to each target audience. Specifically, he explains that the public is not only made up of specific groups such as Democrats and Republicans but that public groups overlap in economical, educational, racial, local, and hundreds of other domains. Thus, Bernays was able to create a voter portrait by categorizing voters according to specific attributes. This philosophy can be seen in Bernays's "pancake

breakfasts" publicity stunt and White House concerts during Calvin Coolidge's presidential campaign. Third, emotional content must be conveyed by the target media. Platforms such as radio and the press must do more than further the ideas of the campaign, they must engage the audience's emotions.

United Fruit Company

In the early 1940s, Samuel Zemurray, owner of the United Fruit Company, hired Bernays to increase banana sales in the United States. United Fruit Company, which controlled more than half of the U.S. market in imported bananas, was one of the largest U.S. companies, with earnings of \$54 million by 1949. Bernays successfully increased banana sales by persuading the public that bananas provided many health benefits. Specifically, he promoted scientific findings by Dr. Sidney Haas, a New York pediatrician, suggesting that the consumption of bananas assisted in curing celiac disease. Bernays also creatively promoted the positive health benefits claimed for bananas on Dr. Haas's 50th anniversary as a physician and mailed approximately 100,000 copies of Haas's findings to dietitians, medical doctors, editors, and librarians. Bernays was also able to connect the importance of bananas to U.S. National Defense and rallied to have bananas positioned everywhere from hotels to airplanes to movie studio cafeterias and to make bananas visible to the public by having large groups (i.e., Boy Scouts and Girls Scouts, professional and college football teams, and students) consume them. Bananas were also included in recipes for pastries and candy.

Legacy

Pioneering the profession of public relations, Edward Bernays lived until the age of 103; his career spanned more than 80 years. Bernays's mass persuasion techniques influenced U.S. Americans' eating habits, changed the social norms concerning female smokers, and manipulated both public opinion and consumer behavior. He pioneered several public relations tactics such as the focus on two-way communication with sectors of the public, propaganda, publicity events, and the use of testimonials and endorsements from

notable public figures. In 1990, *Life* Magazine named Edward L. Bernays as one of the 100 most influential people in the 20th century.

BERTELSMANN

Bertelsmann, or the Bertelsmann SE & Co. KGaA, is the largest media corporation in Germany and the country's only media conglomerate of global significance. Established in 1835 as a Protestant publishing house in the village of Gütersloh in Central Germany, the Bertelsmann group, as of 2021, employs more than 126,000 people in about 1,200 different companies. It holds shares in television and radio channels, magazines, newspapers, and websites in about 50 countries. The group's total revenue in 2019 amounted to 18 billion EUR. Its geographic core markets are Western Europe—in particular, Germany, France, and the United Kingdom—and the United States. In addition, Bertelsmann invests heavily in growth markets such as Brazil, India, and China. This entry opens with an overview of the company and its role in Nazi Germany. It then examines Bertelsmann's television and radio group, book and magazine divisions, and corporate strategies. The

entry closes with a discussion of the Bertelsmann Group's commitment to diversity and journalistic balance.

Company Overview

While Bertelsmann's list of business areas is long, its number one source of income is the RTL Group, which grew out of the Luxembourg-based station Radio Télévision Luxembourg (Radio Television Luxembourg, or RTL). With currently 68 television channels and 30 radio stations in 10 countries, it is the largest private television and radio operator in Europe. With a revenue of 6.65 billion EUR in 2019, the RTL Group generates about 36% of the total income of the Bertelsmann Group. By contrast, the total revenue of the German Public Broadcasting Station (ARD) was around 6.6 billion EUR in 2019.

As a decentralized organization, Bertelsmann is involved in a range of media and communication markets and services. Since 2016, the conglomerate has been divided into eight separate divisions. Besides the RTL Group, it includes the Bertelsmann Education Group, the Bertelsmann Printing Group, and Bertelsmann Investments. Bertelsmann BMG (music rights) is an international music company with 19 offices in 12 core music markets, representing more than 3 million songs and recordings. This includes, among others, the catalogs of Alberts Music, Broken Bow Music Group, and Trojan, as well as thousands of artists and songwriters (e.g., the rights in songs and recordings by artists such as Kylie Minogue, The Rolling Stones, and David Bowie). The Group also owns the service company Arvato with more than 65,000 employees working in a wide range of sectors in more than 40 countries worldwide. Since 2020, Bertelsmann is also the sole owner of the world's largest book publishing group (based on revenue), Penguin Random House, controlling a quarter of the world's book trade, and it owns the international publishing group Gruner + Jahr (G+J). While each division is largely independent, all divisions work together under the umbrella of Bertelsmann. As such, they take advantage of synergies where these exist (e.g., the Bertelsmann Content Alliance).

Like most German media corporations, Bertelsmann is a family-controlled business. After World

War II, it rose from being a medium-sized enterprise to a major conglomerate under the leadership of Reinhard Mohn. As of 2021, the Mohn family holds 19.1% of the company's shares and Mohn's widow Elisabeth and his son Christoph Mohn are on the group's supervisory board (next to Thomas Rabe who was appointed to the board in 2006, and has been its chairman and CEO since 2012). The majority of capital shares, 77.6%, belong to the Bertelsmann Stiftung, a foundation founded by Reinhard Mohn in 1977. Mohn (its long-term chairman) initiated this transfer in 1993. In doing so, he not only secured the long-term control of the family over the company but also saved it about 2 billion EUR in taxes. As of 2021, the Bertelsmann Stiftung is one of the largest and most influential foundations in Germany. Financed by the profits of the company, it spent a total of 90 million EUR in 2019 for nonprofit work (in areas such as education, health, and digital technology). Among its four executive board members are Elisabeth Mohn and her daughter Brigitte Mohn. The other 3.3% of Bertelsmann's shares belongs to foundations, namely the Reinhard Mohn Stiftung and the BVG Stiftung. Members of the Mohn family serve on the executive boards of both.

Bertelsmann's Nazi History

In 1998, when Bertelsmann acquired Random House (a former Jewish group of publishers), a commission of historians investigated the company's role in Nazi Germany. The commission published its results in 2000 in the *Frankfurter Allgemeine Zeitung* (FAZ), a conservative national newspaper. Calling Bertelsmann Hitler's best supplier, the FAZ stated that Bertelsmann topped the Nazi German production statistics due to the unusually high number of books it had produced for the Nazi German army. Due to its regime-friendly publishing policy, Bertelsmann thrived under the Nazis.

After 1945, Bertelsmann's market rise paralleled the more general economic boom in the Federal Republic of Germany. Bertelsmann soon became one of the country's largest book publishers. In the 1960s, the group extended its activities to other European countries; in the 1970s, it targeted the U.S. market (e.g., by acquiring 51% of

Bantam Books). In the 1980s, when West Germany allowed private broadcasting, Bertelsmann entered the commercial television sector. By the 1990s, Bertelsmann had become the world's second largest media conglomerate: It extended its business relations to Central and Eastern Europe, had about 350 direct subsidiaries, and about 45,000 employees. From 1990 to 1991 alone, Bertelsmann reached sales of 14.5 billion Deutsche Mark, and 63% of the sales involved business outside of Germany, mainly in the United States.

Television and Radio: The RTL Group

In addition to radio stations and television channels, the RTL Group offers eight national streaming services, content production, and other digital services. In 2019, the overall revenue of the RTL Group amounted to 6.651 billion EUR with an increase in profit by 10.1% to 864 million EUR.

Key business areas of the RTL Group are the Mediengruppe RTL Deutschland (Germany), Groupe M6 (France), Fremantle (United Kingdom), and the RTL channels in the Netherlands, Belgium, Luxembourg, Croatia and Hungary, and Antena 3 in Spain. While the Mediengruppe RTL Deutschland (Germany) is the group's largest business unit, most profits lie with London-based Fremantle (a producer of drama and talent shows, such as *American Gods*, *American Idol*, *America's Got Talent: The Champions*) and streaming services (e.g., 300 YouTube channels). Thanks to Fremantle, the RTL Group is one of the world's leading producers of television content. Combining the catch-up TV (shows available online for viewing at any time) services of its broadcasters, its multichannel networks (BroadbandTV, StyleHaul, and Divimove) and Fremantle Media's YouTube channels, the RTL Group has also become the leading European media company in online video. Since 2013, the Group also operates in Southeast Asia. On the channels RTL CBS Entertainment and RTL CBS Extreme, it broadcasts for instance in Malaysia, Thailand, Singapore, and the Philippines.

Initially one of many shareholding companies, Bertelsmann has been involved in what was to become the RTL Group since the 1990s. Over time and under the leadership of Thomas Middelhoff, Bertelsmann neutralized other shareholders

(such as Pearson TV in the United Kingdom and Groupe Bruxelles Lambert [GBL] in Belgium) and acquired the majority share in 2001. Since then, the RTL Group has been responsible for most of Bertelsmann's sales and profits, with an increase in shares to up to 90% by 2005. Attempts in 2002 and 2007 to take over completely failed due to financial and legal issues. After this, Bertelsmann changed strategies. In 2013, it sold part of its shares in free float, reducing its ownership share from 92.3% to 75.1% for a profit of 1.4 billion EUR. This profit financed the growth of Bertelsmann, particularly in the digital market.

Since 2019, Bertelsmann CEO Thomas Rabe has also served as the CEO of the RTL Group. While the RTL Group continues to grow in its core businesses (radio and television, partly by means of alliances and partnerships with other European media companies), it currently invests heavily in local streaming services and the development of advertising technologies.

Books and Magazines: Penguin Random House and Gruner + Jahr

Two other highly profitable divisions of the Bertelsmann Group are book publishing (Penguin Random House) and magazines (Gruner + Jahr, G+J). While G+J is one of the largest premium magazine publishing companies in Europe, Penguin Random House is the top player in the international book market, controlling a quarter of its production. Penguin Random House has had this role since July 2013, when Random House (Bertelsmann) and Penguin Books (Pearson Media Group) merged. For a long time, Bertelsmann held 53% of the shares, while Pearson held 47%. Since 2020, Bertelsmann has been its sole owner.

Penguin Random House is a conglomerate of publishers made up of more than 300 imprints across six continents. Its book brands include Doubleday, Riverhead, Viking, and Alfred A. Knopf (United States); Ebury, Hamish Hamilton, and Jonathan Cape (United Kingdom); Plaza & Janés and Alfaguara (Spain); Sudamericana (Argentina); and the international imprint DK. As of 2021, the publishing house employed more than 10,000 people in 23 countries and publishes about 15,000 new titles per year, selling around

600 million print books, e-books, and audio-books. In 2019, the company's turnover amounted to 3.6 billion EUR.

In 2019, Bertelsmann also invested heavily in strategic growth platforms such as the digital business of G+J. Similar to the RTL Group and Random House, the company, founded in 1965, was slowly acquired by Bertelsmann, whose influence grew steadily between 1969 and 1973. Having held the majority share until 2014, Bertelsmann has since been its sole owner. While in the 1990s, G+J was a big player also in the newspaper business (such as in the United States), at the turn of the millennium, the company sold several regional daily newspapers and refocused on the magazine market. As of 2021, G+J's activities primarily focus on Germany and France, where it publishes more than 500 magazines and digital products. Its main associated companies outside Germany include the Groupe Prisma Media (France), Brown Printing Company (United States), and BODA Publishing (China).

G+J, the Mediengruppe RTL Deutschland (RTL Group) and Random House are part of the Bertelsmann Content Alliance. Consisting also of the film production company UFA, RTL Radio Germany and BMG, the Alliance takes advantage of synergies by developing common media content and formats across different markets. As a first collective venture, the Audio Alliance produces podcasts and audio-on-demand offerings, and publishes new products exclusively on its own platform, Audio Now.

Corporate Strategies

Having taken over the RTL Group, G+J and Random House, Bertelsmann, for years, pursued a typical—not innovative—corporate strategy. It acquired and invested vast sums in new media and communications technologies of a market player that had already proved successful. This could also be said for the involvement of Bertelsmann in other media markets (e.g., music, services). As of 2021, the strategy of the group has shifted. Next to strengthening its core businesses, Bertelsmann invests heavily in digital transformation. In particular, G+J launches new magazines and develops digital journalistic pay models, such as Stern Crime Plus, its first paying subscriber

model for digital journalism. Bertelsmann also invests in expanding its other growth platforms (e.g., Fremantle, or the digital businesses of RTL Group, BMG, Arvato Systems), and into growth regions, such as India or China.

In particular, the RTL Group, as Bertelsmann's financial stronghold, aims to translate digital growth into its own business strategies. With massive transformations in the industry, traditional media companies, particularly in the United States, are spending billions of dollars in the battle with global platforms such as Netflix and Amazon. Disney, Apple, AT&T/WarnerMedia, and Comcast/NBCUniversal have launched—or plan to launch—new streaming services. In response to these so-called streaming wars, the RTL Group focuses on building national streaming champions in European countries where the Group already owns leading TV channels: TV Now in Germany, Videoland in the Netherlands, and Salto in France, where the RTL Group company Groupe M6 developed a technical platform for the pay streaming service it operates with TF1 and France Télévisions, stylized as france tv. Complementing global services such as Netflix, Amazon Prime, and Disney+, the RTL Group plans on increasing its streaming content expenditures from 85 million EUR in 2019 to around 350 million EUR in 2025.

Thereby, its overall goal is a higher (linear and nonlinear) reach and the more effective monetization of that reach by means of significant investments in content, marketing, and state-of-the-art tech platforms. With higher investments in advertising technology and data, the group also aims for better targeting and an increased customization of content. The underlying financial requisite, however, is cost reduction. This means consolidations, a wide-ranging review to reduce costs, and the sale of several noncore assets.

Diversity and Journalistic Balance

Bertelsmann highlights its commitment to diversity—in its people, content, and businesses. The company's goal is to have one third of the top and senior management positions across all divisions be occupied by women by the end of 2021. A cross-divisional, international working group

has been issued with this task as well as with promoting diversity at other levels. The RTL Group, having adopted the goal of workplace diversity, broadened its scope. Next to gender diversity, it added ethnicity, disability, and socioeconomic status.

With regard to content, Bertelsmann's vision of diversity lies with journalistic balance. Its aim is to represent the range of opinions of the societies it serves. According to the Bertelsmann Code of Conduct, this means editorial and journalistic independence (within the company), the freedom of the press (from political and economic influence), artistic license, and a compliance with existing laws regarding the separation of editorial content and commercial advertising. In addition to this Code of Conduct, several subsidiaries have implemented their own individual editorial statutes and rules. These focus primarily on duties of journalistic care, respect for privacy, issues with the representation of violence, and the protection of minors.

One question for Bertelsmann and its subsidiaries is how to appeal to a mass market across national boundaries while including issues of cultural, ethnic, or gender diversity in content. While changing audience demands open new market niches (e.g., G+J's magazine *Brigitte Be Green* responds to the social trend toward sustainability), by default, content must be profitable while markets must be large (e.g., geographically, demographically). Bertelsmann's general answer to this question lies in digital transformation. With more investments going into marketing and state-of-the-art tech platforms and with higher investments in advertising technology and data, content offerings and new formats based on (advertising) data are to allow for more customized services. These are the driving forces also behind current transitions in the production in journalistic content under the Bertelsmann umbrella—a technology-driven journalism, individualized by ad-based algorithms.

BIAS

Journalists covering news in countries where freedom of the press is legally protected are expected to report on a range of issues with clarity, comprehensiveness, accuracy, and a balance of quoted viewpoints. A news story is expected to be free of the reporter's own overt opinions—to be objective. When a news story is judged less than comprehensive, accurate, or objective, the story might be interpreted as biased. Bias is an allegation usually reserved only for news journalists whose professional expectation is to quote others but to keep their own viewpoints out of the story, because of the long-standing cultural expectation of journalistic fairness, viewpoint balance, accuracy, and objectivity.

This entry provides an overview of different notions about news-media bias, the ways it has been formally studied, and what researchers have found. It then briefly points to recent changes in journalism and society that may call into question the traditional notion of news bias.

Background and Overview

Journalistic bias is a relatively recent concept, historically speaking. Journalistic *neutrality*—and therefore, news bias—could not have had any meaning in the earliest days of American journalism, when political partisanship in the press was the norm. It was only through the commercialization of the press, beginning in the United States in the 1830s, and the professionalization of news reporting, around the turn of the last century, that the gradual development of qualities such as objectivity, fairness, and viewpoint balance could be recognized as routine traits of news coverage. The door was finally open for allegations of news bias, since the public might now reasonably expect their news to be delivered “straight,” with no political or ideological taint one way or another.

Opinion pieces and editorials in traditional newspapers would not typically be the subject of bias because opinions—which routinely appear on op-ed pages clearly segregated from news pages—are persuasive by nature. Nor does so-called fake news fit within the concept of news bias because fake-news stories, appearing on digital media sites, are either purposely embellished or wholly fabricated, so to call these biased is beside the point.

Bias, then, is a potential problem existing within “straight” (putatively objective) news reporting, and might be deemed to exist when any news story is judged to not meet expected professional journalistic norms because it is alleged to be slanted or skewed favorably *toward* mostly just one political or ideological side of an issue, and slanted *against* one or more opposing sides. Bias might be in evidence when a news story's content or overall presentation is judged, fairly or not, to fall short of providing a fair, viewpoint-balanced, comprehensive, and objective account of a disputable issue. But bias might also be found in any individual's perception of it, regardless of whether a given story is biased in content or not. In other words, what may be biased for one news consumer may be fair and accurate for another.

Media bias has been studied for several decades by communication and political scholars using a wide range of methods and variables to attempt to document its existence in various news mediums. Media scholars and commentators point out that

the concept is hard to define in any stable way or to consistently document because of the different ways that scholars have theorized and studied it. But bias remains an enduring allegation against news media if only because large numbers of news consumers consistently allege its existence.

Trust in the news media has been low for decades, and this could partly explain why so many news consumers continue to think the news is biased. A 2018 study by the Pew Research Center found that only 47% of Americans, regardless of political or ideological affiliation, said the news media covers the news fairly, while slightly more, about 56%, thought the news was covered accurately. A 2019 national study by Pew that asked about trust in 30 well-known news outlets found self-identified Democrats were far more likely to trust most of the outlets than were Republicans, who trusted only a handful. Roughly the same divide was noted when respondents were asked about journalists' ethical standards: Republicans were far less willing to see high ethics among journalists than were Democrats.

The Nature of Media Bias

Academics have found it difficult to develop common measures of news bias because there are so many possible ways to conceive of and document it, with no single agreed-upon standard. Is news bias simply the existence of some aspect of coverage in a given story, such as a headline, deemed to be unfair, or too many partisan sources in a story depicting one side, but none or only a few sources included representing the other side? Or is it what might be left out of a story that someone believes should be in it? In this latter case, bias would be defined not by what is there but by what's not.

Others might think bias exists when, for example, a conservative-branded cable TV broadcast, such as Fox News, de-emphasizes a clearly relevant and politically charged story by giving it scant coverage on a given evening, while a competing liberal-oriented news program, such as MSNBC, gives the same story much more air-time and prominence. Any systematic emphasis or de-emphasis of this nature could possibly indicate bias on a given evening, but this would have to occur routinely to qualify as an enduring problem of news bias.

Scholarly studies looking at the *content* of coverage can only attempt to capture what kind of information is in a story, and from there attempt to discern how well or poorly a given set of stories meets some standard of bias, or, alternatively, non-bias. But other studies consider not so much (or not only) news content but the news *consumer* and his or her inherent political and ideological "cognitive" biases—the preexisting beliefs every person has that could lead to individual perceptions of news bias regardless of whether it exists in actual news content.

The Search for News-Centered Bias

Several decades of academic studies attempting to define and track news media bias provide conflicting means of measuring the concept. Regardless of the method, these studies generally find only weak and inconsistent, if not negligible, evidence of any enduring liberal or conservative bias among news outlets themselves. Some media scholars contend bias, if it exists, may be found not only among partisan journalists but also from within a newsroom's structure, such as too few reporters covering too many things or pressing deadlines leaving reporters with only so much time to cover a topic more fairly.

A frequently cited 1999 study found something like a self-fulfilling prophecy about bias—that the news media's persistent, critical coverage of the topic of bias *itself* seems to foster subsequent perceptions, among the public, of media bias, more often from Republicans than Democrats. Ironically, coverage of media bias may create the perception of media bias among news consumers.

Studies showing actual, persistent, overt bias in news media content, in general, have found only negligible support for it. A 2006 meta-analysis of nearly 60 scholarly media-bias studies focused on newspaper, newsmagazine, and television network news coverage of U.S. presidential elections found only weak support for any persistent content bias. A lingering problem in any study of news content bias is just what elements count as biased. Is bias the result of how news-media outlets select and prominently present, or, by contrast, *de-emphasize* different stories? Maybe it's the amount of print space or television air-time devoted to any story. Or, according

to another measure, bias could be evaluative in nature—how words or phrases themselves might subjectively slant a story. The lack of certainty about the existence of news media bias could easily stem from academics choosing different methods of documenting it.

Some studies track media content for unique indicators of bias—such things as how many paragraphs are devoted to one side or another; how many quotes are given to different sides; how the same news story is reported by different news outlets; and certain word choices that may reveal bias. These latter studies, dealing with the content of news stories via quantitative content analysis, are in search of what some scholars have called *partisan* bias, the partisanship being linked to the reporter or reporting organization, as revealed via one-sided content.

Also to be considered within content studies is what might be labeled “structural” bias—that journalistic work routines, constant deadlines, and daily pressures of simply putting a story together day in and day out may result in a story being biased just because there was inadequate time to make it more balanced and fair. A 2006 study along these lines, reviewing 2004 U.S. presidential election-coverage bias among the three major TV networks (ABC, CBS, and NBC) found some arguably slight bias by CBS against incumbent candidate George W. Bush, but no statistically significant bias overall among the networks. Another content study, published in 2019, found that TV stations in four U.S. markets owned by the conservative Sinclair media chain did display a somewhat larger number of partisan (conservative) sources, compared to non-Sinclair stations in those same markets, but the study was limited to only those four markets. But other bias studies, not primarily focused on news content, take the *person* as the locus of bias.

Perception Biases Within the Individual

Many studies have found that the individual’s own assumption about the existence of bias is the predominant factor in “seeing” bias regardless of whether the content comes from traditional or social news media. The bulk of the available evidence from scholarly studies, especially in recent years, seems to show that the person, rather than

news media outlets and actual content produced, is the creator, or the *projector* of any perception of bias.

The basis of bias typically lies within a given person’s own preexisting political and ideological beliefs, especially among those with stronger partisan views one way or another. This was the case in a 2010 scholarly study that showed one’s own stated political ideology, during a high-profile governor’s race, was the key element behind any allegation of media bias; those with partisan views “projected” or created their own sense of news bias, and those favoring the candidate deemed most likely to win (in this case, the Democratic candidate) saw generally less news bias during the governor’s race than did Republicans, whose candidate was less likely to win. Other factors, such as one’s propensity to selectively expose oneself to ideologically “friendly” news outlets, or a person’s ongoing association with politically like-minded individuals, can also be factors in one’s finding bias in a story. Some studies review news consumers’ stated attitudes and assertions about the existence of bias revealed, for example, through surveys of news content keyed to a disputable issue over time. Individuals’ ideological and political preferences and affiliations, or more generally, psychological attributes, in other words, tend to result in individual or group allegations of biased content.

A phenomenon validated for over three decades, the “hostile media effect”—the idea that people “see” bias in news coverage against (i.e., hostile to) their own political side—is based in the person’s own closely held political attitudes and associations. In other words, a conservative will see a liberal bias in a story, and vice versa, though studies generally show that the effect is greater among conservatives than liberals. A related concept is “confirmation bias,” a similar psychological attribute in which a person selectively seeks information that confirms one’s already existing ideological beliefs, thereby “confirming” and strengthening the preexisting bias.

Some experimental studies, where certain test variables are manipulated in a lab setting, show that how a story is “framed” to focus on one or more significant thematic features may lead a person to see bias in it, especially when specific story attributes are “primed”—purposely

highlighted—which then might lead a person toward a certain heightened interpretation. It is important to note that what might be manipulated and tested in a lab setting, which might then lead test subjects to see news bias, is entirely different from the actual real-world setting in which each media consumer, carrying his or her own political, ideological, and psychological beliefs, has free selection over how much and what type of news media content to consume.

The Fracture of Consensus

With just over a decade of smartphone use and the continuing rise of partisan social media news, as well as, more recently, “fake news” proliferating through bots or ideologically driven digital sites that can alter existing news reports or even wholly create false content, the notion of news bias may itself be somewhat antiquated. The veracity of truth and facts as bedrocks of social understanding are now in question as information from an array of partisan and even false sources increases, leading to what some call a “post-truth” world. A 2017 study discovered a person’s “trust” in media, whether in traditional media, social media, or even citizen-created sites, did not grow regardless of the chosen medium, and that the greater a person’s perception of media bias the *less* one tends to consume news, regardless of news format.

Many persons now silo themselves into their own friendly ideological groups and partisan-based news outlets, thereby comfortably confirming their preexisting beliefs and personal biases. In a world of constant and highly selective digital news consumption, the concept of news bias—always difficult, at best, to demonstrate, whether sought for in news content, newsroom structure, or news consumers themselves—may have to be rethought alongside ever-changing notions regarding the nature, value, and reliability of information, facts, and truth itself.

BLACKLISTING

The relationship between news/public affairs broadcasting and political affairs has been close since radio’s launch in 1920. The ability to transmit messages to potentially large audiences made broadcasting a tantalizing prospect to politicians of all colors. The divisive political struggle between conservatives and liberals influenced broadcasting most visibly and negatively during the period

known as the *Red Scare* (1947–1957). Although news media are constitutionally protected from government influence in the United States, the historical reality is that broadcasting is frequently susceptible to political pressures.

The early cold war (1945–1960) following World War II saw a growing distrust of communism and a deep-seated fear that “Reds” were infiltrating the United States. Political conservatives sought and identified suspected Communists in every walk of life. Although anti-Communists vigorously asserted that they were responding to a threat to national security, historical evidence is ambiguous. Some historians interpret the Red Scare as a conservative backlash against liberals long in power. Recent research in the former Soviet Union, however, reveals that the country did successfully infiltrate several institutions in the United States during the 1940s and 1950s. At the time, however, with little evidence to support the Red denunciations but innuendo and blacklists, the fear of being labeled a Communist left the country nearly paralyzed.

Broadcasters were susceptible to politically motivated attacks for a number of reasons. Significantly, they are licensed by the Federal Communications Commission (FCC), which is overseen by the legislative branch. Further complicating their vulnerability to the Red Scare was broadcast dependence upon sponsors. Until about 1960, network entertainment programs were produced by sponsors and their advertising agencies. The considerable profits reaped by selling airtime enabled broadcast networks to subsidize news and public affairs programming. Accordingly, accusations of coddling Communists threatened that relationship. At the same time, the rapid transition from radio to television placed networks and stations under greater financial pressure.

Network Response

Although the influence of the Red Scare on broadcasting started as early as 1941, a single publication in June 1950 escalated political pressure on the industry. A conservative group issued a paperback book titled *Red Channels: The Report of Communist Influence in Radio and Television* that took the form of a “blacklist” that publicly identified an individual with communism with the intent of

denying employment and socially alienating the accused. *Red Channels* listed the names of nearly 150 individuals, including 10 broadcast journalists. NBC and CBS took immediate notice of *Red Channels*, although the two networks responded differently.

NBC was undeterred by *Red Channels* or other blacklists and rarely denied employment to a person accused of being a Communist. NBC was a subsidiary of RCA, one of the most profitable and powerful corporations of the mid-20th century, and was led by David Sarnoff, whose power over NBC/RCA was unquestioned and whose conservative politics were indisputable. Further, NBC enjoyed the luxury of RCA's financial resources to support it through the transition from radio to television. For these reasons, NBC could financially and politically afford to risk criticism for failing to heed the blacklists; its corporate and political credentials were above reproach.

CBS was more vulnerable as it lacked the financial largesse that NBC enjoyed from RCA. By 1950, when *Red Channels* was published, CBS was involved in two very expensive endeavors: developing its television network and its consequent need for programming and affiliates, and the innovation of a color television system. Further complicating the situation was the perception that network chief William S. Paley was considered politically liberal. These factors prompted CBS to respond very differently to *Red Channels*. It developed a two-layer system of investigating alleged subversive activities of its employees. A “clearance” system vetted talent for “suspicious” activity and individuals whose names were blacklisted were fired or not hired by CBS. The second layer required employees to sign loyalty oaths on which they swore they were not and never had been Communists.

The elite corps of broadcast journalists at CBS, led by Edward R. Murrow and including Eric Sevareid, William Shirer, Charles Collingwood, Alexander Kendrick, and Don Hollenbeck, was incensed by the loyalty oaths. Nevertheless, Murrow encouraged his team of journalists to sign the oath, as he did himself. Murrow chose his battles carefully and was already considering future broadcast investigations of the Red Scare; thus he was willing to sign the loyalty oath. CBS's willingness to institute a loyalty oath for its employees

revealed the lengths to which the network went to protect itself and its business interests.

Broadcast Journalists

“Are you now, or have you ever been, a Communist?” Although relatively few broadcast journalists were asked this question before a congressional hearing, being labeled as suspected Communist or sympathizer was an anxiety that many endured. Radio commentators were an early target of *Counterattack*, the newsletter that began publishing in 1947 as, in the words of writer David Everitt, an “anti-Red muckraking publication that would drag not only Communists but all their defenders out into the light.” Anti-Communists feared journalists would use their access to the airwaves to broadcast views favoring Communist positions and responded by publicly naming journalists they believed to be Communist sympathizers.

In 1950, the publishers of *Counterattack* released *Red Channels* and identified 10 broadcast journalists whose political affiliations allegedly indicated Communist sympathies. The list included prominent journalists such as Kendrick and Shirer, as well as Howard K. Smith and Lisa Sergio. The evidence cited was questionable, largely depending upon the testimony of suspected Communists before congressional committees, or on the speeches, appearances, or organizational memberships of the journalists. For example, chief among Shirer’s “offenses” was that he signed a petition to the Supreme Court encouraging reversal of the convictions of the “Hollywood Ten” for refusing to testify as to their political beliefs. Smith allegedly criticized the U.S. government for meddling in the 1948 Italian elections. Kendrick’s offenses included publishing essays in *New Masses* and *Soviet Russia Today* and leading a panel discussion during a meeting of the National Council of American-Soviet Friendship. Sergio, a commentator and broadcast journalist for both NBC and ABC, was cited for signing a petition that urged outlawing anti-Semitism.

It is notable that none of the “evidence” that *Red Channels* listed against the 10 broadcast journalists included any actual broadcasts. Smith and Kendrick later reported that their inclusion on the blacklist did not affect their professional

or personal lives. Shirer, on the other hand, believed that being blacklisted had a significant impact on his career, and soon after his *Red Channels* appearance he left broadcasting and turned to freelance writing and lecturing. Interestingly, Soviet archives later revealed that one of the lesser-known journalists included in *Red Channels*, Johannes Steel, was, indeed, a Soviet agent.

Blacklisting was accomplished through other means in addition to *Red Channels*. Aware, Inc. was formed in 1953 to ferret out Communists from radio and television. It produced “Publication No. 12” in which suspected Communists were named and, as John Cogley writes in *Report on Blacklisting*, “decreed ‘unemployable.’” Other journalists were identified in the popular press. One of the tragic repercussions of blacklisting was the case of Don Hollenbeck, who worked for CBS News and was identified as a Communist-sympathizer by Jack O’Brian, a columnist for the Hearst-owned *New York Journal American*. Hollenbeck’s subsequent suicide in June 1954 was understood to be partly the result of being blacklisted. Whatever the means of public identification, the reputations and credibility of broadcast journalists suffered as a result of extreme political pressures.

News Programs

Fundamentally, the Red Scare in broadcasting came down to concerns about content. Although there is no evidence to suggest that any broadcast journalist communicated pro-Communist messages, blacklisters nonetheless feared that they might. Anti-Communists sought to prevent the spread of communism by creating a climate of fear in which journalists self-censored their material. Broadcast journalists who were blacklisted correctly understood that they were targeted because their personal convictions challenged conservative politics.

Although the networks and many advertisers capitulated to the atmosphere of fear, either tacitly like NBC or overtly like CBS, one voice of resistance was heard amid the silence. By the autumn of 1953, Murrow, arguably the most influential broadcast journalist of his time, decided to confront the Red Scare. In a series of reports

broadcast for his television program *See It Now*, Murrow hosted a number of investigations into prominent figures of the Red Scare, including Air Force Lieutenant Milo Radulovich and Pentagon employee Annie Lee Moss. Radulovich had been dismissed from the Air Force for maintaining close relationships with suspected Communists (his father and sister), while Moss was suspended from her clerical position for being a suspected Communist. The most influential and historically significant broadcast, however, was Murrow's March 1954 investigation of the tactics used by Senator Joseph McCarthy, in which Murrow used television clips to skillfully and publicly denounce the senator.

Although Murrow did not espouse a pro-Communist message, he adeptly used television to publicly challenge the power of the leading anti-Communist crusader. Even so, the business aspects of the broadcasts remained paramount. Murrow had to get his sponsor's permission to shift its commercials, and CBS refused to advertise the programs for fear of the political and commercial backlash. Nonetheless, many historians consider the Murrow-McCarthy broadcast to be one of the more important in the history of television as an early example of the medium's power, particularly in the hands of a skilled and credible journalist.

Implications

The Red Scare started to fade with the U.S. Senate's censure of McCarthy in 1954, and blacklisting was fully exposed and discredited in 1962 when *Aware, Inc.* was found guilty of libel when it blacklisted an actor. With enough political and historical distance, industry leaders such as Paley and Frank Stanton of CBS later regretted instituting the loyalty oaths and using blacklists. Certainly the lives of blacklisted figures were changed, some more than others.

The Red Scare period of blacklisting is a case study of the dangers of using political yardsticks to measure journalists. Although anti-Communists did not directly engage in prior restraint, their accusations and blacklists had a strongly chilling effect on broadcast journalists whose personal politics were used as "evidence" of their lack of objectivity and credibility. The end result was

that one of the most significant news stories of the 1950s received remarkably little broadcast news attention.

The tenuous relationship between politics and broadcasting reverberated after the decline of the Red Scare and continues today. Walter Cronkite's denunciation of the Vietnam War in 1968 was a turning point in the public's antiwar attitudes. Richard Nixon used the FCC to target television stations that opposed his politics. By the late 1990s, as American politics became more conservative and the FCC loosened station ownership restrictions and suspended its former fairness doctrine, the number of broadcast and cable outlets that carried conservative talk shows escalated while liberal voices remained largely unheard.

BLOGS AND BLOGGERS

A blog (short for weblog) is a type of webpage format that generally utilizes a reverse-chronological order. However, there are strong definitional issues when attempting to elucidate blogs within a journalism context. Unlike traditional media, blogs refer to both the technological means of delivery and the content of that delivery. The means of delivery offers access to a greater proportion of the public than traditional media distribution methods and features, which in turn modifies the types of content created.

Despite not having a concrete definition that clearly separates blogs and bloggers from their traditional media counterparts, blogs and bloggers play a unique role within the modern journalism ecosystem. Blogs and bloggers are shifting the boundaries of what is considered acceptable from journalists, while also acting as a check on the media. Much research on participatory digital journalism has shifted to social media networks and big data as they have come to once again shift the overall atmosphere around online journalism since they came to prominence for the general public in the late 2000s onward. However, blogs and bloggers should not be discredited for their impact on the audience, their interplay with traditional media, the original reporting, and analyses that they have brought to view.

Some scholars have attempted to define the specific characteristics of journalism blogs as a genre or category within the larger journalism sphere while others have claimed that it is not possible to effectively define. In the same way that high-level questions and related concepts like “what is and is not considered journalism?” and “who are and are not considered journalists?” are contentiously debated, blogs and bloggers are not easy concepts to define. Blogs can be viewed within the specific contexts, wherein they reside or in relation to the more general journalism ecosystem. As such, this entry discusses various characteristics and elements that differentiate many (but

not all) journalism and journalism-adjacent blogs as well as people behind those blogs.

From their origins in the 1990s, blogs were initially an avenue for citizen and public journalism. Bloggers were often experts, insiders, and enthusiasts seeking an outlet for their knowledge. One such early example includes Matt Drudge and the *Drudge Report* that utilized Drudge’s political connections within right-wing circles as sources. As they grew in popularity, news organizations began to incorporate staff- and topical-based blogs into their offerings. At times, the traditional media created content aggregation agreements with or outright purchased blogs instead of creating their own, with a few such examples including *The New York Times* working with Freakonomics from 2007 to 2011 and Ziff Davis purchasing Mashable in 2017.

Blogs run the gamut of topics, ideologies, specialties, and approaches, although individual blogs generally take a specific niche or focus. Websites such as Crooks and Liars and RedState each cover news and politics, but from an outwardly progressive and conservative bias, respectively. Other sites take a different approach to what they add to the content, such as FiveThirtyEight, which covers a wide range of topics, including politics, sports, news, entertainment, but usually from a statistical analysis perspective. Similarly, sites like Pharyngula unabashedly examine science from the perspective of a “godless liberal,” which is in the blog’s tagline.

However, one need only look as far as the Huffington Post to understand the difficulty in defining what is and is not a blog and what is and is not a traditional media organization. The Huffington Post historically has had both staff journalists and unpaid contributors. The organization was the first digitally run platform to win a Pulitzer Prize in 2012. It continued to utilize unpaid contributors until it removed that platform in January 2018. Much of the content that is published is still not necessarily original reporting and functions like an aggregator. Some of the stories involve personal narratives and opinion mixed in with analysis and reporting. The website has specific sections that focus content for different audiences, including a “Communities” section with subsections for Black Voices, Queer Voices, Women, and more. There are still reporters and

editors, but the lines are significantly blurred compared to the traditional structure of newspapers. On top of that, it was acquired by AOL in 2011 and later AOL was acquired by Verizon in 2015, making it part of one of the largest telecommunication companies in the world. The website rebranded as HuffPost in 2017 and was again acquired by a different parent company, BuzzFeed, in 2020 after which numerous layoffs occurred. Many still consider the website a blog, however there are significant qualitative differences between it and countless other blogs. HuffPost still shares some qualities of a blog, including technological, tonal, and topical similarities but also has some elements of more traditional news, including utilizing wire services, limiting access for the comment section for posts to only registered users, and others.

Technological Characteristics

Although blogs are not necessarily built on content management systems (CMS), those CMSs have helped usher in the ease of use and availability of blogs, and websites with a blog component. Services such as Blogger (purchased by Google in 2003), Blogspot, and WordPress provide platforms that allow individuals and organizations to create and distribute blogs. Other forms of blogs, such as the centralized and pseudo-socially networked platform that Medium utilizes, have grown in popularity over time. In fact, WordPress has become such an important platform within the World Wide Web ecosystem that one survey by W3Techs.com estimates that around 35% of all websites are built on the CMS.

Common features include posts and pages, widgets, comment sections, and more. Blog posts and pages are often differentiated in terms of the timeliness (or timelessness) of the content. Posts are produced, published, and distributed within the main area of a blog in the reverse-chronological order, making up the timely nature of the content. These posts can be supplemented by pages, which are generally more timeless. Pages often include elements like contact information, privacy policies, an “about” page, and more.

Within the overall scope of blogs and blogging technology, a variety of approaches to content

creation have come to be. One such approach includes the idea of “live blogging” an event or story, wherein one or more reporters give short and quick updates on the story at hand so the audience can follow along in almost real time. Live blogs can take multiple forms depending on the type of story. Certain stories tend to lend themselves more readily to this format, including political debates and election night coverage. Blogs run by traditional media organizations, such as ABC or *The Washington Post*, may utilize a live blog to keep the audience apprised of the facts of the event while a nontraditional news organization, such as Politico or Daily Kos, may focus more on real-time analysis of those facts. Both are utilizing the same types of technology to create different content along organizational standard lines. Live blogging is also used to cover some press conferences and product releases. The website MacRumors publishes a live blog whenever Apple holds a press conference to announce new products. Those live blogs often incorporate text and images from the event.

Other technological aspects of blogs can be seen in the differentiation between blogs and microblogs. Microblogs such as Twitter limit the author’s communications to a small and restricted set of options. In the case of Twitter, one can only post a single tweet with up to 280 characters (up from the previous maximum of 140 characters when the service launched, which at the time aligned with the length of an SMS text message).

Comparisons and Connections With Traditional Media Organizations

Blogs that are independent of news organizations offer different types of coverage and analysis in comparison to those of most mainstream news organizations in the United States. One element that is significantly different is less of an emphasis on objectivity. In many cases, these blogs are not necessarily doing original reporting. However, much of the content is not that type of original reporting but instead an analysis of others’ reporting. One instance was when then-Senate Majority Leader Trent Lott resigned his leadership post after numerous blogs highlighted and focused on quotes wherein Lott had supported Strom Thurmond’s 1948 presidential candidacy that

highlighted numerous racist policy positions after they were originally underreported by other legacy outlets. Those legacy outlets, in turn, then covered the story again but focused on the angle highlighted by the bloggers. Other instances often involve augmenting the reporting with additional sources, context, opinion, and facts, among other elements. Examples of those blogs include the previously mentioned Crooks and Liars and RedState that generally bring together information from a variety of different sources and cases to analyze a news story from their specific political perspectives.

In that respect, blogs and bloggers do have distinct roles that often do not necessarily mirror that of traditional journalism outlets. One such shift is the distinction in that there is a different division of labor. If a blog is run by an individual, they would be handling all of the writing, editing, managing, distribution, advertising, and essential functions that are often separated across numerous individuals and roles within a traditional organization. One positive is that it allows a more nimble and agile approach that does not require numerous layers of reporters and editors prior to publication. With that, one might be more apt to make errors but with the added advantage of being able to publish more quickly when focusing on the timeliness of a story. Those same blurred lines can still occur even in organizations where the traditional structure may not apply. Generally, as blogs become more popular and post more frequently, they take on a different organizational structure that more closely mirrors that of traditional media. Such structure then leads those blogs to focus on highlighting traditional journalistic values, including focusing on original reporting and separating editorial and business operations.

Over the course of their existences, some blogs have gone from independent to aligned/converged with corporate media, including the website FiveThirtyEight. The website was founded in 2008 by Nate Silver, a statistician who had been working as a baseball analyst and blogging on the political site Daily Kos. He founded FiveThirtyEight as an independent blog, but formed a content agreement with *The New York Times* in 2010. With that agreement, some of the content characteristics (such as frequency of posting and length of articles) and authorship shifted, thereby

highlighting how traditional, corporate influence can either directly or indirectly manipulate a blog's content. ESPN then acquired FiveThirtyEight in 2013 with a plan to broaden the site to include sports and economics along with politics. In 2018, FiveThirtyEight moved to ABC News, which shares the corporate parent Disney with ESPN.

Blogs often invite direct communication with the audience in a way distinct from the traditional media. For traditional media, there are limited means wherein the audience can communicate with the organization, including letters to the editor, calling the office, commenting on the organization's website. Many traditional journalism providers, including NPR, *Popular Science*, and Reuters, have limited online comments as they work to determine how best to monitor and display comments. For blogs, the participatory nature of interaction between the audience and the authors is often viewed as a defining quality, particularly in the form of comments.

One must also consider the role of blogs within the sociopolitical arena to which they are compared. For blogs in countries that utilize state-run media, they can act as a voice against the hegemonic control of the government. The increasing access to the technology that makes the blogs possible allows for more dissenting opinions voiced. However, those blogs and the bloggers that write for them do still have to worry about attempted censorship and threats of violence.

Comparisons and Connections With Traditional Journalists

Blogs offer a different venue for individuals to counter the traditional gatekeeping role over which the mass media have generally had control. Markos Moulitsas, founder of Daily Kos, in part founded the blog as a means of challenging what he viewed as a lack of input from the average person in the dominant narrative coming from media organizations and elite journalists. Similarly, others have questioned whether blogs under the umbrella of corporate media organizations are qualitatively within the category of blogs as the bloggers themselves do not have as much freedom within the organization's editorial and ownership structure. From there, one role

that independent bloggers can have that is not duplicated by traditional journalists is that of the “fifth estate,” wherein bloggers act as a watchdog of the journalists. While there is the role of the ombudsperson or public editor for singular publications, a watchdog blogger can look for greater trends and issues across the journalism spectrum. A watchdog blogger can offer their critiques across different organizations to see if journalism as a whole—rather than within a single organization—is displaying a particular issue, concern, or trend.

There is a symbiotic relationship between traditional journalists and bloggers. That relationship can be more particularly pronounced in niche content areas. Topics such as science or business journalism that often require specific training and knowledge to communicate the often wonkish details or context of a story, while at the same time those areas receive relatively fewer resources within traditional media, can bring bloggers that do not view themselves as journalists to the fore. From there, journalists can learn from the expert bloggers to shift the agenda or practice their gatekeeping function differently. Research has also shown an intermedia agenda setting function of the traditional news organizations on bloggers with many posts linking back to corporate media websites. Additionally, as reported by Homero Gil de Zúñiga and colleagues in 2011, over time, more bloggers have come to view their work as journalism.

Although not unique to blogs, hyperlinks are a central element in the content of blogs. The hyperlinks act as a verifiable source for the audience to make decisions about the source material for themselves. Instead of simply quoting an original source without the full context of the surrounding information, the users can choose whether or not to follow the link and better understand the veracity of the author’s claim or statement. The hyperlinks support the type of content that many bloggers create: analysis and opinion based on facts and others’ original reporting. The bloggers can then contextualize and combine the various reports together to create something new. These links also function as a means of highlighting other, similar sources, which in turn can lead to those other sources linking back to the original blog. However, some have criticized this practice

as a means of creating echo chambers within the digital sphere.

In line with the shifting news values illustrated by blogs in comparison to traditional media, many bloggers also shift the lines in terms of what is generally considered acceptable behavior by newsmen. For example, many organizations have specific codes of ethics and conduct that outline what objectivity and subjectivity mean for the organization and what conduct is considered acceptable and unacceptable for its reporters. Bloggers, on the other hand, often include elements of their identity and self-presentation front and center in their coverage and analysis. There has been some loosening on those expectations for traditional journalists, which varies significantly by organization, beat, and medium. Additionally, traditional journalists may have more leeway around identity and self-presentation through personal social media channels rather than incorporated into pieces published by their organizations.

The audience’s reaction to the differentiation between bloggers and journalists is another important characteristic. Various studies have looked at the uses and gratifications for why the audience seeks out independent bloggers (either amateur or professional) in contrast to journalists. For some, there is a strong distrust for anything that is aligned with corporate media influence. Others want the analysis that is included with the specific slant of their choice. The genre, topic, and presentation of the blog also dictates how the audience views the credibility of the blogger. One example includes looking at amateur war bloggers—sometimes soldiers themselves—in contrast to war journalists. The journalists were viewed to have less credibility on the events of war as they are disconnected from the fighting and firsthand experience of the soldiers. However, the bloggers had more credibility as they could include personal narratives that described their experiences on the ground in a way that traditional journalism norms did not allow.

BLOOMBERG

Bloomberg News is a news service based out of New York operated by Bloomberg L.P. that since its founding in the early 1980s has increased the competition among business news wires. Although it is best known for providing business and economic news to investors, it also carries content in other areas, including the arts and politics. In 2019, Bloomberg News had more than 2,700

reporters and editors in 130 countries and published more than 5,000 stories per day. It has become a well-known newsgathering organization that has won dozens of awards and now includes television, radio, magazines, and book publishing divisions. This entry discusses the company's history, its impact on journalism, its newsroom culture, the influence of its founder and namesake, and its expansion in the beginning of the 21st century.

Former Salomon Brothers general partner Michael Bloomberg founded the company that became Bloomberg L.P. with his severance pay in 1981. Originally, the company just sold computer terminals to Wall Street investment banks that included financial data about stocks, bonds, and other investments. Those financial data still provide the bulk of the company's revenue.

The name changed (1986) and the company began what was originally called *Bloomberg Business News* (1990) with a six-person editorial team. Bloomberg hired *Wall Street Journal* reporter Matthew Winkler, who had written a story about Bloomberg for the *Journal*, to run the operation. The news service was—and still is—provided on the terminals, which are leased for about \$2,000 per month. The first Bloomberg news story was published in June 1990.

During its first year, Bloomberg Business News opened bureaus in New York, Washington, London, Tokyo, Toronto, and Princeton, New Jersey, writing about the stock market and company news that had previously been covered by other wire services such as Dow Jones, the Associated Press, and Reuters. By early 1995, the organization had grown to 325 reporters and editors in 54 bureaus and had started an investing magazine called *Bloomberg Personal* that was distributed as a Sunday newspaper supplement. The two main newsrooms at that time were in Princeton—for business and company news—and New York—for markets and financial news.

In its early years, Bloomberg Business News distributed its editorial content to other media organizations to improve its name recognition, giving terminals for free to newspapers in virtually every U.S. city. Those newspapers then pulled Bloomberg stories off the wire and ran them in their business sections. In many cases, Bloomberg helped the newspapers by creating an index of

local stocks that could run each day in the business section.

Bloomberg attracted business journalists from daily newspapers and other media organizations by offering them higher salaries and stock certificates that fluctuated in value based on the number of terminals sold by the company. The number of installed terminals reached 10,000 in 1990 and doubled by 1992, the same year that the company introduced *Bloomberg Markets* magazine. The 50,000th terminal was installed in 1995, and the company leased its 75,000th terminal in 1997. In 2004, the company surpassed the 200,000 installed terminals mark. In 2019, it had more than 300,000 terminals.

The organization purchased WBBR-AM, a New York-based radio station with a business focus, and launched a show on several New York area television stations in the 1990s. WBBR is the flagship radio station of Bloomberg Radio (1993), which syndicates reports to radio stations around the world. Bloomberg Television (1994) operates 24 hours a day, competing against CNBC and Fox Business Network, operating in seven languages. In 2019, Bloomberg Television is available in more than 433 million homes in more than 70 countries.

In 1996, Bloomberg started Bloomberg Press, which publishes books for financial professions and the general public on investing, economics, and current affairs. One of the first books was based on the reporting of Bloomberg business journalists Carrick Mollenkamp, Joseph Menn, and Adam Levy.

In 1997, *Time* magazine's Wall Street columnist Daniel Kadlec criticized Bloomberg in a *Columbia Journalism Review* article for putting pressure on newspapers and other media outlets to use more of the media organization's content. Kadlec noted that Bloomberg had pulled its terminals out of some newsrooms that weren't using or attributing Bloomberg editorial content in their publications. Bloomberg's Winkler denied that the organization placed quotas on other news organizations. However, by the end of the decade, Bloomberg had stopped giving its terminals to other media organizations at no charge.

As Bloomberg grew in the business news world, its competitors became wary of its success. "Bloomberg found niches that Dow Jones and

Reuters didn't fill," wrote Bloomberg in his 1997 autobiography *Bloomberg by Bloomberg*, cowritten with Winkler. "From the start, it was easier for us to add to our basic product what they provided, than for them to add what we built to theirs." Dow Jones ended up selling its Telerate data operations (similar to the Bloomberg terminal in that they were leased to Wall Street traders and contained data about investments) because it couldn't compete with Bloomberg, and in 1998, Reuters employees were accused of stealing confidential data from Bloomberg in an attempt to copy some of its services. A competing service, Bridge Information Systems, started in the 1990s, but went out of business after the stock market bubble burst in 2000.

Bloomberg has been a major force behind changes in journalism. For example, Winkler was behind a push for Regulation Fair Disclosure, a law enacted by the Securities and Exchange Commission that requires public companies to disseminate important information to everyone at the same time. Previously, companies could choose to block investors, analysts, and journalists from listening to its conference calls discussing its earnings or other news, and from attending meetings where it discussed its operations. The new regulation gave business journalists access to more information about the companies they covered.

Bloomberg's newsrooms have traditionally included fish tanks with exotic fish from around the world for a soothing presence and snack bars filled with soft drinks, potato chips, cookies, and fruit designed to keep reporters and editors at their desks. The company also has a reputation of having an intense, editor-driven culture.

Business journalists who join Bloomberg are trained to write stories in a specific manner based on the internal stylebook, *The Bloomberg Way*. The book, which has been updated several times since its original publication in 1995, tells its reporters how to cover specific stories, such as company earnings and the daily stock market performance. Basic Bloomberg News stories are known for their four-paragraph lead structure, which includes the "nut" paragraph (the paragraph that explains the rationale for the story) as the third paragraph and a quote in the fourth paragraph.

The Bloomberg terminal has become a handy reporting tool for many business journalists around the country. The terminal provides access to information about millions of company executives, Wall Street analysts and investors, and industry consultants, including phone numbers and email addresses. It also provides Securities and Exchange Commission documents for all public companies, and a recent addition to the service includes lawsuits and legal rulings.

Michael Bloomberg's political career has caused issues for Bloomberg News, which has struggled with how to cover its owner. When Bloomberg was mayor of New York, the news service appointed one reporter to cover him. However, it does not include him in its billionaires list, which was launched in 2012, although he easily qualifies. His net worth is \$54.3 billion, according to *Forbes*. During his candidacy for the 2020 Democratic presidential nomination, Bloomberg banned his reporters from aggressively covering his campaign or writing investigative stories about his rivals.

Business journalist Carol Loomis of *Fortune* estimated in 2007 that the company's 2006 operating profits were about \$1.5 billion with \$4.7 billion in revenues. Loomis also estimated that Bloomberg's stake in the company is worth more than \$13 billion, and that the overall company is worth about \$20 billion. Bloomberg L.P. reached \$10 billion in annual revenue in 2018, and it is the market share leader in financial market data, analysis and news, with 32.5%, according to Burton-Taylor International. Reuters is No. 2 with 22% market share.

Bloomberg acquired *BusinessWeek* magazine from McGraw-Hill in 2009 and renamed it *Bloomberg Businessweek*. It now has a global circulation of 600,000. Arlington, Virginia-based Bureau of National Affairs, which provides news to business executives and government officials, was acquired in August 2011 for \$990 million to bolster its existing Bloomberg Government and Bloomberg Law news services. *Economist* editor John Micklethwait replaced Winkler as editor in chief in 2014, and the news service won its first Pulitzer Prize the next year. Reporter Zachary Mider won the Pulitzer by documenting how U.S. corporations could lower their taxes and gain an edge on competitors

simply by claiming a new legal address in a foreign country.

Bloomberg began an expansion of Bloomberg Radio in 2016, and in 2018 it launched TicToc by Bloomberg, a news service available on Twitter. The same year it began charging for access to its content on the Internet, and it has greatly expanded its podcast strategy. With business news coverage growing in importance in the 21st century, it seems likely that Bloomberg News' stature will likely continue to grow.

BLY, NELLIE

Although her newspaper career began in the 1880s, Nellie Bly remains one of the most remembered and romantic figures in the field of journalism. Under the tutelage of her editors and with the encouragement of publisher Joseph Pulitzer, Bly captivated readers with her journalistic adventures, which were often a mix of muckraking and sensationalism that led her from the depths of New York's notorious Blackwell's Island Asylum for women to a race around the world. At a time when female journalists were a rarity, especially outside the realm of women's publications or literary journals, Bly lent her distinctly female perspective to stories that otherwise would have often gone unnoticed or, at best, would have been covered by male journalists in a way that lacked her human connection with her subjects.

Bly is remembered even now for her bravery and her bravado. The iconic image of Bly in her checkered coat and jaunty hat, carrying her small valise, has been immortalized in children's books, games, and even an American Girl doll. Few figures in journalism, male or female, have managed to capture the public's imagination in the way that she did. Fewer still have had their legacy stay alive long enough to remain an inspiration to budding journalists, especially young women, for more than a century. This entry traces her career from its precocious start with the *Pittsburgh Dispatch* and her stories of subsequent travel in Mexico, to her relocation to New York City and the assignments for the *New York World* that would make her famous, her subsequent marriage and widowhood, and her work for the *New York Evening Journal*, which she continued until shortly before her life ended in 1922.

Beginnings

Nellie Bly's work carried her into the public eye at an early age, and as she gained popularity, her early life story quickly became part and parcel of her persona and only added to her intrigue. Bly began life as Elizabeth Jane Cochran when she was born on May 5, 1864, in Cochran's Mills, Pennsylvania, a small town near Pittsburgh aptly named after her father, Michael Cochran. Her mother, Mary Jane, who was Cochran's second wife, clearly doted on Elizabeth and dressed her in pink to the extent that the little girl soon took "Pink" as her moniker, a harbinger of changes to come. Her life was drastically altered, though, after her father's death in 1870 left her mother and her siblings in tight financial straits.

Although her mother struggled to support the family, Pink was able to begin attending the Indiana State Normal School in 1879, when she was 15 years old. It was at this time that she added an "e" to her last name, making it Cochrane. The move was never really explained, but nonetheless followed by her mother and younger brothers. Soon after, Pink's chance for an education disappeared as her family's financial situation became dire. Pink was forced to leave school and move to Pittsburgh with her family, where they would be closer to her older brothers and find greater opportunities for work. These were formative years for Bly, as she never forgot her mother's financial struggles, intensified by her gender, as she sought some of the few avenues of employment available to women of that time.

Early Newspaper Work

Although she did not finish her formal education after leaving the Indiana Normal School, Pink was drawn to reading the local newspapers in Pittsburgh, including the *Pittsburgh Dispatch*, which published Erasmus Wilson's regular column, "Quiet Observations." It was in one of those columns that Wilson criticized women who ventured outside the realm of the home to work, thereby, he alleged, ignoring the needs of their husbands and families. After reading his words, Pink took it upon herself to defend women who, like her mother, were forced by circumstances beyond their control to find ways to feed their families,

and so she wrote Wilson a letter. She chided him for ignoring the realities of so many women's lives, and then, in closing, she signed her name as "Lonely Orphan Girl." Clearly, as would happen so often in her life, Pink caught the eye of an editor, and the *Dispatch* printed a query asking for "Lonely Orphan Girl" to reply. Rather than send another letter, Pink showed up at the newspaper's office, and in no short time, despite her problems with spelling and grammar, she found herself with a job and a way to aid her family's fortunes. The *Dispatch's* managing editor at the time, George Madden, decided she would need a better byline than "Pink," and after throwing out the question in the newsroom, the name Nellie Bly was suggested and adopted. Although its origin is unsure, it appears likely to have come from a popular Stephen Foster song at the time, "Nelly Bly," with a slightly different spelling. With her new name in tow, Pink began to hunt down and write stories that zeroed in on the social ills of the day, including the perils of young girls working in local factories, archaic divorce laws that disgraced women, and labor laws that disproportionately penalized them. It was 1885, and 21-year-old Nellie Bly, as she would now forever be known, was off and running to her future.

The World Awaits

Bly stayed with the *Dispatch* about 9 months before deciding she wanted to broaden her horizons. In just one instance of her audacity, Bly, without even a year under her belt at the paper, complained to her editors about the inconsequential articles she was expected to write. So, without much thought to what she would do, she left the *Dispatch*, although articles continued with her byline, probably the result of freelance work. But, in January 1886, with her mother in tow, Bly headed south. While with the *Dispatch*, she had been part of an "entertainment" committee for a delegation from Mexico that had visited Pittsburgh. The country and its culture intrigued her, so Mexico was where she decided to land. Bly kept detailed notes of her trip, commenting on the people, other journalists, the country's culture, and its politics. She learned the ropes of how to censor her stories to get them past Mexican

authorities, and she saved some truths for when she would return to the states. She traveled the country extensively, not endearing herself to the local governments, and returned to Pittsburgh in late June, earlier than anticipated. She returned to the *Dispatch* to write her most honest impressions from the trip, resulting in the publication of *Six Months in Mexico* (1888), the first of her books chronicling her journalistic adventures.

Although glad to be back in Pittsburgh at the time, it did not take long for Bly's restless nature to take over again. Deciding to seek even greater opportunities, she boldly made the decision to move to New York City in May 1877 and try her hand with one of the big newspapers there. She went without the offer of a job, so to make money while she searched for employment, she brilliantly proposed a series of interviews with New York City newspaper editors, which the *Dispatch* then agreed to publish. It was an inspired move, as Bly introduced herself by way of the interviews, including one with the editor of Joseph Pulitzer's *New York World*, who offered her a job with the paper. It was here, with the *World*, that Bly's career would take off as she undertook one of her most famous assignments, reporting on the mistreatment of patients at New York City's notorious Women's Lunatic Asylum, located on Blackwell's Island in the East River. Although it has never been clear which one of them proposed the idea, either the *World's* managing editor, Colonel John Cockerill, or its publisher, Joseph Pulitzer, asked Bly to pose as an insane woman and have herself committed to the asylum, so she could investigate the veracity of reports on the conditions there.

Bly threw herself into the assignment, taking on a disguise and the name Nellie Brown, as she exhibited behavior that landed her in Bellevue Hospital and ultimately Blackwell's Island. Her experience was horrific, even as she no longer acted as though insane. She made notes on the substandard care, food, and treatment and left after 10 days when a lawyer for the *World* came to arrange her release. Bly's stories from her experience ran as columns in the *World* in October 1887, and the attention they received surpassed anything she or her editors could have imagined. There were immediate cries for reform at Blackwell's Island, and the asylum and other

institutions like it came under intense scrutiny. Before the end of the year, Bly's columns were released in book form and sold under the title *Ten Days in a Madhouse* (1887). At 23, Bly had made a legitimate journalistic name for herself and acquired a reading public thirsty for more.

In the months that followed, Bly would go on to use her newfound fame to continue reporting on societal ills, especially those facing working girls and women in the city. She even took on stories investigating government corruption and she always seemed to find a way to gather proof, much to the chagrin of her subjects. Her writing was often referred to as *sensational*, in a demeaning way that portrayed it as inappropriate work for a woman. Bly paid such charges no mind and continued reporting and writing on what she wanted. Her dogged determination would lead to another story that solidified her reputation even more, but this time her name would be heard around the world.

Travels With Nellie

Joseph Pulitzer and his *World* were always on the lookout for ways to sell more newspapers and outstrip their competition, especially the Hearst papers. Again, there are discrepancies as to exactly who first thought up the idea, but the paper pounced on sending a reporter to try and recreate the journey in Jules Verne's novel *Around the World in 80 Days* (1872). Bly insisted that she be chosen for the trip, but there were reservations about sending the young (age 25) woman without a chaperone on such a journey. The discussion was cut short by Bly's assertion that she would go to work for another newspaper if not given the assignment, and she was soon preparing for her trip. One interesting side note that has never been fully explained is that Bly wrote down the wrong year for her birth on her passport. Instead of 1864, she wrote 1867 and did not correct the record when her age was reported as 22 on the trip. It was an error she would let stand until her death.

On November 14, 1889, Bly set sail on the *Augusta Victoria* and began the trip that would have readers eagerly awaiting every word she wrote about her travels. She was the talk of the town and the country as the *World* challenged

readers to guess her arrival times at her various destinations and offered money to the winners. Although *Cosmopolitan* had its own female reporter, Elizabeth Bisland, making a similar journey, it was Bly who captured the country's imagination. Much to Pulitzer's pleasure, the trip was a resounding success as Bly bested Verne's character, Phileas Fogg, by 8 days. The *World's* circulation skyrocketed as New Yorkers greatly anticipated her arrival back home on January 25, 1890. In the same way as *Madhouse*, Bly's newspaper stories of her journey were quickly compiled into a book, *Nellie Bly's Book: Around the World in Seventy-Two Days* (1890), which became an instant success.

It was this adventure that sealed Bly's reputation as a popular culture figure, and her likeness could be found on games, trading cards, paper dolls, and numerous other collectables. She found herself in demand for lectures, as people wanted to hear directly from her about her experiences. She also had other offers of money to write, and so by the end of 1890, she had left the *World* to pursue these other ventures. It would not last, though, as she ended up back at the *World* in 1893, again pretty much writing whatever stories caught her attention, from government malfeasance to high society, and on occasion being accused of taking license with some of her facts.

Post-World

In her late 20s and early 30s, Bly did progressively less of her journalistic work and, for a period beginning in 1895, she was married to Robert Seaman, a millionaire businessman who, at 69, was 39 years older than Bly. The marriage got off to a rough start, but the two stayed together until his death, at age 80, in 1904. Bly, who was almost 40 at the time, was left to handle his failing business ventures and spent several years in Europe trying to raise capital to keep things afloat. When World War I broke out, she turned once again to the skill that had never failed her, and she wrote stories as a foreign correspondent covering the war in Europe, one of the few female journalists to do so. When she did finally return to New York in 1919, she wrote regularly for the *New York Evening Journal*, whose publisher, William Randolph Hearst, was

a nemesis of her old boss, Joseph Pulitzer, who had died in 1911. She would write until the end of her life, with her last article being published on January 9, 1922, a little over 2 weeks before her death from pneumonia on January 27.

Bly's rise to fame and her journalistic record are astounding even without taking into consideration the time period. But, in light of her limited education, her family's subsequent poverty, and society's limitations on women, her achievements are even more impressive. In an industry completely dominated by men, Bly held her ground, fought for stories, and stood up for better pay for herself. She was a champion for women who struggled to work and survive in this time, and although she died relatively young at 57, she did live long enough to see women gain the right to vote. Her name has not lost its cachet, as her image is still found today in the form of dolls, new books, and games. Her early journalistic career can be described as a form of muckraking, investigative journalism that would thrive in the early 1900s, as her writing resulted in societal change and advanced opportunities for women in journalism. In her iconic travel coat and hat, Nellie Bly, who was always moving forward and never shied away from the attention she garnered, left a journalistic legacy that continues to inspire and encourage young women today.

BOTS

Bots are software programs that are programmed to achieve predetermined missions. Bots range from simplistic script bots to more sophisticated smart bots that can aid in server processing functions. Bots are automated technology that can perform uniquely human functions, which operate without the need for human assistance once programmed. Bots can be used to follow or interact with profiles on social media platforms such as Twitter. Bots are increasingly a visible and invisible force in the production of news, social media, the spread of misinformation, aggregation, customer service, and artificial intelligence (AI). This entry examines bots in the context of newsgathering and discusses different types of bots. The entry also discusses past and potential future bots.

Newsgathering

Newsgathering operations use bots to gather stories from specific outlets for distribution on an aggregate website, wherein bots are employed to skim the web for stories. This example is foundational to the functioning of aggregate news websites. One of the primary reasons for the advent of bots is to accomplish the goal of executing repetitive tasks without the need for human operators, as bots are often faster than humans with regard to repetitive tasks. Bots are used to execute workflows without the need for extensive human interaction or oversight, enabling organizations to save money on human labor and capital. Companies use bots for instant chat services that, for example, automate answers to questions for customer support. This ability to execute repetitive tasks in an efficient manner makes bots valuable tools, especially when applied to the Internet and through social media networks. Bots that interact with the Internet sphere are used to comb through data, analyze content on web pages, and interact with human users. Users interact with bots online every time a query is made or an input rendered. With the increase of social media platforms as aggregators of news information and the circulation of news, the interaction between bots as nonhuman actors and human accounts is complicated by a lack of transparency.

Bots spread information to human actors and attempt to push conversations, narratives, news stories, and trending topics in programmed directions. As a kind of AI, voice-activated bots such as Google Assistant or Siri can respond to human prompts and provide answers to questions. While not all bots are manipulative, people can use bots for nefarious purposes such as scamming human users, breaking into accounts, and spreading malware, misinformation, disinformation, or spam. People can use bots to spread “fake news” as well as propagate opinions that masquerade as facts on social media and that ultimately may be true or untrue. Another emergent use for bots in this same vein is to promote products, services, or even currency, such as forex trading, cryptocurrency trading, and mobile and web-based gaming applications. Since bots can often execute functions more efficiently and expediently than human actors, bots are able to buy up or control commodities and deny the ability of the market to

service the needs of the consumer as intended. For instance, people can employ bots to auto-buy consumer electronics or other desired retail products, which has been an issue in terms of scarcity caused by a high demand for products such as new video game consoles.

Types

There are several different types of bots with specific umbrellas of purpose and scope that vary depending on their affordances and capabilities outlined below.

Chatbots

Chatbots are one of the most commonly used types of bots and are the most frequently encountered by human users. People often use chatbots in customer and technical support applications. These bots respond to inputs established by programmers to aid users without the presence of human intervention. The outputs of chatbots are uniform and regular and, in some ways, can eliminate some innate human biases that exist in interactions. Organizations also use chatbots to offer users 24/7 support in whatever application the bots service. Transactions between organizations and consumers are an executable task for chatbots; for example, chatbots can complete certain transactions with cable providers or banks.

Web Crawlers

Another type of bot is the web crawler. Web crawlers are bots that analyze data and content over a wide spectrum of domains on the Internet. Web crawlers are sometimes referred to as *spiders* or *spider bots*. The intention of these spider bot missions is to index pages across the Internet. This work is integral for research purposes, and for many types of Internet research to be efficient, researchers need web crawlers to function as the organic workforce necessary to index and retrieve pages in a cost-effective manner. For example, web crawlers are used extensively in university research systems as well as medical research systems. Web crawlers index pages that aid search engines in more effectively collecting and organizing web pages, which gives users a more orderly search

and research experience. Users are on the receiving end of the work of web crawlers when they input queries into search engines. The results rendered are the work of web crawlers and algorithms, despite the user never directly interacting with web crawlers. People also use crawlers for image indexing in addition to data and text indexing. Image indexing performed by web crawlers is augmented by AI applications that aid in the work of categorization and filtration of content. This is evident in reverse image lookup applications, and this action is only possible through the use of web crawlers and other skimming bots. Reverse image lookup allows users to input an image, rather than words, to obtain search results.

Social Bots

Social bots are commonly seen on social media platforms such as Twitter or Instagram. One can classify these profiles, operated by social bots, as “fake” accounts. These accounts garner “followers” to artificially inflate the influence and value of other real or artificial user accounts. Social bots can challenge the perceived authenticity of interactions on social media platforms. Many social bots have integrated the behaviors of chatbots, making it difficult to distinguish between real and artificial accounts for users who are aiming to interact with other human actors on social media platforms. Social bots can work to shape public opinions and attitudes of users who interact directly or indirectly with social media platforms, similar to the role that Internet influencers perform in popular culture. These social bots are used to post comments on news platforms as well as video hosting platforms. Companies responding to the rise of social bots, especially around election time, have tried to limit this infiltration by employing various safety measures and protocols. For example, Yahoo has at times disabled their comments section entirely to protect the user experience. Other sites such as *The New York Times* and *Fox News* have tried to employ bot detection through the Completely Automated Public Turing Test to Tell Computers and Humans Apart, as well as the periodic culling of inactive accounts to avoid having comments sections be compromised by bots. Further complicated by regulation, even if the use of social bots becomes

illegal, it will still be a strategy used by influencers around the world, as virtual private networks and other proxy mechanisms can easily mask the origin of bots and their “owners.”

Malicious Bots

The last major classification of bots is the malicious bot. These bots distribute spam, scrape content, obtain financial information and passwords, monitor and log keystrokes, and participate in the infiltration of secure information and the scamming of users. Financial institutions, such as brokerages, have to take extreme precautions and security measures to safeguard sensitive information. Companies such as Sony and Target, for instance, have been compromised by coordinated bot attacks, which have resulted in the credit card numbers and password information of users being stolen.

Malicious bots are also used in denial of service (DoS) attacks. DoS attacks are a crucial component of cyber warfare. These attacks are often carried out by bot “swarms” that seek to degrade the integrity of the network connection between specific vulnerable systems. For example, malicious bot swarms could be used in this capacity by disrupting the connection of a regional airbase communication network to the Internet and, therefore, the larger military communication infrastructure. To combat these bot swarms, other bots are employed to stop these attacks by identifying malicious behavior from unknown sources. However, there are some positive uses for bot swarms. People can use bot swarms to analyze information from automated drones in search and rescue operations to find stranded hikers, sailors lost at sea, as well people impacted by the chaos of natural disasters. Medically, bot swarms can be integrated with nanomachines to analyze physiological phenomena within the body in real time and give researchers and medical professionals insight that previously has been unable to be gleaned.

Past and Future

Although one can trace the first recognizable instances of bots back to Alan Turing and the Turing test (e.g., tests related to the presence of mind, thought, or intelligence) and Joseph Weizenbaum’s

creation of ELIZA (one of the first chatbots), bots entered the realm of social networking with Internet relay chats (IRC) and the rise of instant messaging. The reason for the employment of these early bots was to keep IRCs open even when users were absent. These webcrawler bots operated to index varying web pages and service search engines and platforms such as America Online. However, by the mid-2000s, bots were so prevalent and had infected so many computers and networks that hackers were able to use these newly established botnets to carry out criminal activity, such as the infiltration and acquisition of information on secure sites and the explosion of spam through email.

Bots are now highly influential in the emergence of social media platforms globally and can be problematically deployed when left unregulated. A prime example is the bot infestation on platforms such as Facebook during the 2016 U.S. election cycle, as well as the elections of many other nations, intended to spread misinformation and shape public opinion and perception. Bots have transformed rapidly across platforms, and laws are unevenly applied with regard to bots. Before leaving office, President Barack Obama signed into law on December 14, 2016, the “Better Online Ticket Sales (BOTS) Act of 2016,” which makes it illegal to use automated software, so-called ticket bots, to purchase tickets to popular events. Bots continue to become more prevalent as the amount of data on the Internet continues to expand. Bots aided by AI entities will continue to evolve and adapt to the vast quantities of information that they can encounter. For example, bots and AI work in conjunction in the reverse lookup of images. As of 2021, it is logical to believe that the same function used with regard to images may be used to reverse lookup other content such as video content and gifs. This would require bots that are more sophisticated than the ones that are already in common employ. The continued evolution of bots into intelligent agents could usher in new applications and methods of aiding users and new challenges within the realms of security and privacy. Bots are an integral, vital pillar upon which many of society’s digital experiences rely.

BOYCOTTS

A boycott is an organized refusal to purchase from, trade with, or work for an organization in an effort to influence or reform it or otherwise draw attention to an issue that it represents. Boycotts are publicized and sometimes organized by news organizations, as well as targeted at them. After considering the history of boycotts, this entry describes different kinds of boycotts aimed

at or originating from news organizations, notes how boycotts have proliferated due to the affordances of digital and social media, and concludes with an examination of the politics of boycotts, in terms of their effectiveness and their structural role in the media system.

Histories of the Boycott

The term *boycott* was coined in 1880 in the wake of a community-wide withdrawal of labor and trade from English land agent Captain Charles C. Boycott. Organized by the Irish Land League, the withdrawal was a response to Boycott refusing to negotiate reduced rents for struggling Irish farmers and moving to evict them. The idea of using *boycott* as a term to describe this form of protest was arrived at by a local priest and an American journalist reporting on the Irish land troubles. As it became publicized in the press, the term *boycott* quickly entered common parlance, was translated into other languages, and appeared in *Webster's Dictionary* by 1882.

Its rapid adoption likely occurred because while the term was new, the practice was not. The origin story of boycotts as a practice is frequently located in pre-Revolutionary America, when non-importation and nonconsumption of British goods was a key way that colonists expressed their displeasure at British rule, as well as built common cause and a unified political identity across different social groups. This movement highlighted the political potential of consumer power, dramatically illustrated by the Boston Tea Party of 1773, during which protestors tossed imported tea—that most British and imperial of drinks—into Boston Harbor to protest British tax policy in the American colonies. The notion that boycotts are particularly American in nature has persisted, particularly given the prominence of boycotting in the mid-20th century Civil Rights movement, when African American activists organized a mass withdrawal of patronage from the Montgomery Bus system in Alabama, as well as in Don't Buy Where You Can't Work campaigns against discriminatory employers, to name just two examples.

However, boycotting as a social practice has a longer and broader history. Boycotting foreign goods has been a feature of several resistance movements to colonization, just one example

being the Indian practice of *swadeshi*, a movement originating in the 19th century where people boycotted foreign-produced goods, particularly clothing, in favor of domestic products.

Boycotts and American Journalism

The American media, including news organizations, are mostly for-profit enterprises that depend on some combination of consumer purchase, subscription, and advertiser support. When Americans are unhappy with what they see in media, boycotts are one of the tools they use to express their displeasure and attempt to change it.

The most direct kind of media boycott occurs when audiences stop purchasing a particular media product. This occurred in the early days of the American press in 1731, when clergy encouraged people not to purchase Benjamin Franklin's *Pennsylvania Gazette* or patronize his printing business in protest of an advertisement he had printed, for a ship offering berth for passengers to Barbados, that stated clergymen would not be admitted. Franklin's "Apology for Printers," a letter he published on the front page of the *Gazette*, made it clear that such threats to withdraw support from his newspaper arose on a regular basis. He went on to offer a full-throated defense of his right as a printer to publish what he saw fit, given both his need to make a living and his bedrock belief that truth would vanquish falsehood when subjected to public debate, and that such judgments ought to be made by the public and not the printer.

Franklin's passionate defense of press freedom may well have bolstered the many publications that would be on the receiving end of public disapprobation via boycott in years to come. For example, in the early 1930s, the *Baltimore Sun* and *Evening Sun* papers were widely boycotted because their most famous columnist, H. L. Mencken, vigorously denounced two lynchings that took place on the Eastern Shore of Maryland and the lack of criminal accountability for those who had perpetrated them.

While editorial positions have inspired boycotts against news organizations, investigative reporting has been another cause. For example, General Motors withdrew its advertising from the *Los Angeles Times* in 2005 for 4 months to protest its unflattering coverage of the company,

returning only once they felt convinced the paper had come to understand its point of view. This kind of advertiser boycott illustrates one of the reasons why, as Edward Herman and Noam Chomsky argued in their book *Manufacturing Consent*, a mostly advertiser-supported media system has a systemic pro-business bias. Even if these kinds of boycotts are not frequent, they create an incentive for journalists to self-censor in order to avoid conflicts with important advertisers.

Another type of media-targeted boycott leverages advertisers by pressuring them to withdraw ad dollars from objectionable content. While this type of boycott is more indirect, it is often favored when targeting media funded completely or in part by advertisers. Activists realize that media organizations will react more quickly to a loss in ad revenue than a loss in audiences. Further, it is easier to influence the behavior of a few large advertisers, who tend to be sensitive to bad press or a dip in sales, than to change people's media habits. This strategy is particularly relevant if the audience of the target media does not share the politics of the activist organization, as when the socially conservative American Family Association pressured the Ford Motor Company in 2005 and 2006 to stop advertising in publications serving gay and lesbian readers, such as *The Advocate*. The American right-wing cable channel Fox News has been a frequent target of this boycotting strategy. Bill O'Reilly, *Fox News*' leading star for many years, was fired in 2017 after a campaign encouraged advertisers to withdraw their support for his program *The O'Reilly Factor*, in light of revelations that the network had arranged settlements with a number of women due to an ongoing pattern of sexual harassment by Mr. O'Reilly. Other Fox News personalities have been reprimanded or temporarily taken off the air for comments deemed offensive or inaccurate, in response to pressure from advertisers who, in turn, are responding to pressure from individuals and liberal advocacy organizations such as Media Matters.

The converse also happens, when consumers threaten to boycott a company if they withdraw their advertising support from a favored program or publication. In 2017, USAA, a financial services and insurance company that serves the members of the military and veterans, withdrew its

advertising dollars from *Hannity* on Fox News due to the host's continued repetition of disinformation about the murder of a Democratic National Committee staffer but then reinstated its support due to customer complaints and threats to boycott, encouraged by right-wing advocacy groups such as the Media Research Center.

News organizations can themselves be instrumental in advocating a boycott. This was the case in the late 1970s, when the gay press rallied gay and lesbian consumers to boycott Florida oranges and orange juice, because the Florida Juice Commission's spokesperson, Anita Bryant, was a prominent opponent of gay rights. In 2002, a coalition of six African American newspapers promoted a boycott of the *Philadelphia Daily News* to protest racially insensitive reporting. And in 2016, the far-right online publication *Breitbart* called for a tit-for-tat boycott of Kellogg's products because the company had pulled its advertising from the site due to content deemed offensive.

Even when news organizations do not themselves initiate a boycott, their coverage is crucial to boycotts gaining attention and public support, especially since the impact of boycotts can be as much through damaging an organization's reputation as on its bottom line. In the 1980s and 1990s, there were even alternative press publications in the United States devoted solely to reporting on consumer boycotts at the national level.

Boycotts, Digital Media, and News

The rise of digital media has escalated the frequency, speed, and geographic reach of boycotts. The greater ease of publicizing boycotts via websites and email, eventually enhanced by social media platforms, creates a more even playing field where boycotts emerging from the grassroots can gain widespread public attention without having to go through journalistic gatekeepers. However, the ease of calling for boycotts online has also meant that their proliferation can hurt the impact of a single campaign. When many boycotts compete for consumers' attention and when they seem to come and go with great frequency, the seriousness of their threat can diminish.

The rise of digital has also changed how advertising space is sold, leading many advertisers to

find their marketing messages placed next to offensive and misleading content, often on sites that are, or claim to be, doing journalism. Programmatic advertising means that advertisers increasingly do not buy ad space in particular publications but participate in automated marketplaces that sell ad impressions for particular demographics or individual users wherever they may be online. As a result, more politically extreme and journalistically questionable publications have earned significant advertising revenue online in a way that was not possible in a print world. Some activists, such as those affiliated with the organization Sleeping Giants, now inform brands in a very public way on social media when their ads appear next to offensive or misleading content, giving them an opportunity to remove their ad support in order to prevent a consumer boycott.

In 2020, a coalition of civil rights organizations called for a pause on advertising on Facebook, a campaign called *#StopHateforProfit*. More than 1,000 advertisers, including large brands such as Adidas, Unilever, Microsoft, and Ford, pulled their ad dollars to pressure Facebook to take the elimination of hate speech and the spread of disinformation on its platform more seriously. The campaign pointed to the role of hate speech and disinformation in the genocide of the Rohingya Muslims in Myanmar, starting in 2016, as one example, and conspiracy theories about the death of George Floyd in Minneapolis in May 2020 as another. While much of this content appears on Facebook in posts from individuals and ads, some of what passes for news also perpetuates disinformation.

The Politics of Boycotts

Boycotts are a strategy of protest used across the political spectrum, ranging from small collectives on the local level to large corporations, nation states, and even transnational coalitions. Their effectiveness varies tremendously. Some boycotts actually lead to more sales or bigger audiences for the target, as they unintentionally provide free publicity and activate those from opposing perspectives. Some boycotts have no discernible impact, while others do lasting damage. Even when a boycott does not impact sales, the resulting

damage to an organization's reputation can hurt its share price, its standing with regulators, and its relationships with business partners.

Beyond the politics of a particular boycott, or whether it achieves its goals, are the meta-politics of boycotts, especially in relation to journalism. News organizations that have been the target of boycotts appeal to the principles of free expression and freedom of the press, as Franklin did in the first half of the 18th century. Franklin's concern that journalists and publishers receive undue pressure that stifles novel or unpopular content continues to be relevant in 2021. In the American media system, self-censorship and chilling effects have been more likely to occur as the result of advertiser or corporate pressure than from government action. The proliferation of boycotts in recent decades targeted at advertisers in order to reform media content reflects the reality of U.S. media economics and reinforces the power of advertisers in the news ecosystem, rather than challenging that structure. Boycotts are a market-based form of activism that position audiences as consumers rather than citizens and strengthen the market-based nature of journalism rather than question it.

BRADY, MATHEW B.

Mathew B. Brady (1823/1834–1896), the father of photojournalism in America. While portraiture was the centerpiece of Brady's early work, he is best known for his studio's work documenting the American Civil War.

For someone whose work depended entirely on sunlight, Brady lived his life largely in the shadows of history. According to historians, he left either three or zero letters written in his own hand, no diary, papers, or any other sort of written record of his experiences, thoughts, or observations. If it could not be said with silver nitrate on a piece of glass, he was essentially mute. Furthermore, he personally was responsible for shooting only a fraction of all the thousands of Daguerreotypes and glass plates he left behind.

Early Years

Brady's birthplace and year have never been firmly established, nor does anyone—including Brady himself—know what his middle initial stood for. Even his birth is something of a mystery. Brady claimed in an 1861 interview with George Townsend of the *New York World* to have been born in upstate New York in Warren County, but he demurred at giving his actual age. He even chided Townsend for asking him how old he was. Brady replied to the question of his age, "Never ask that of a lady or a photographer; they are

sensitive" (Townsend, 1891). The photographer continued by saying that he would tell the reporter, for fear he would find out some other way, that he had been born in Warren County, NY, between 1823 and 1824 to Irish immigrants Andrew and Julia Brady. Despite his claim in the interview, on his 1863 draft form and in prewar census records, Brady is listed as having been born in Ireland. Some historians have speculated Brady disavowed his Irish birth because of anti-Irish sentiment.

Absolutely nothing is known of his earliest years—no information survives regarding his schooling, how his family made its livelihood or how many siblings he had, though one historian claims he was the youngest of three. Historians disagree even over whether Brady could write, though they do seem to agree that he could read. One historian points out that three existent letters signed by Brady were clearly written by another party. It is known that when he was about 16 years of age, he suffered an eye ailment and traveled to Saratoga, NY, for treatment. Brady received the treatment, though he would be plagued by weak eyesight his entire life. However, the trip changed the trajectory of his life.

In Saratoga, he met painter William Page, who offered to give him drawing lessons at his studio in Albany. Page eventually moved to New York City, he opened a studio near what is today New York University, where he had studied with Samuel F. B. Morse, better known to journalists as the inventor of the telegraph, but who worked as a professor of art and design at the college and had been one of Page's instructors. Page introduced Brady to Morse who showed the boy a new art form he had learned about on a trip to France to patent his telegraph—the Daguerreotype, an image affixed chemically to a copper plate. The process produced a living image rather than a piece of art. Morse brought back one of Louis Daguerre's cameras and used it to open a school of Daguerreotype photography in order to supplement his meager university salary. Brady was one of his first students.

Portraiture Projects

Brady, wearing blue-tinted spectacles that helped his weakened eyes, worked as a department store clerk for Irish-American immigrant Alexander

Turney Stewart and studied with Morse for several years before opening his first studio, the Daugerrean Miniature Gallery, in 1844, at around the age of 21. The gallery was on the top floor of the building. He chose this location so that he could install skylights. He had noticed that Morse had built his house to let in as much sunlight as possible. Brady added the skylights to accomplish the same objective in his gallery's Operating Room (studio).

Unlike New York's other famous 19th-century photographer, Jacob Riis, who made his reputation photographing the squalor and plight of New York City's poorest residents, Brady focused on American success stories by specializing in portraiture of prominent politicians and other famous individuals. A year after opening his first gallery, Brady conceived a massive project of photographing all the prominent Americans he could for a work to be titled the *Gallery of Illustrious Americans*. His manuscript included portraits of noteworthy politicians of the day such as Daniel Webster, Henry Clay, John C. Calhoun, and an aged Andrew Jackson. The portrait of Jackson may have been taken by Nashville photographer Don Adams. The custom of the day was for the gallery owner to receive credit for photographs taken by members of his staff or, apparently, even contract employees.

Another of his early projects was undertaken in either 1845 or 1846. Brady worked with feminist author Eliza Wood Farnham, warden of the female prison at Sing Sing, to illustrate a book she was bringing out. Originally published in England, the book, *The Rationale of Crime* by Marmaduke B. Sampson in 1841, dealt with phrenology and crime. Brady took headshots to illustrate the manuscript.

Published in 1850, the *Gallery of Illustrious Americans* was a huge book weighing nearly 5 pounds. It was bound in brown leather with gold lettering and sold for \$30. Probably because of the price, the book was never much of a financial success, but it did receive excellent reviews, which helped draw attention to Brady's work and contributed to his winning multiple awards at the 1851 World's Fair in London and establish American superiority in the field of Daguerreotype photography. As he had worked on the project, he also began entering his portraits into different

competitions. He won competitions so frequently that one Daguerreotype journal commented in 1848 drolly, "Mr. B. has won again" (Horan, 1955, p. 9).

Brady was in London for the World's Fair because overwork had worsened his eyesight and he needed a break to recover. Also, he had married Julia Hardy, daughter of a Maryland plantation owner in 1849, and a trip abroad would give them the opportunity to take a delayed honeymoon.

At the World's Fair, American photographers took three of the top five awards; Brady himself received the award for general excellence. The European press grudgingly admitted that the Americans had perfected an art, developed in France, to the point that they surpassed European practitioners. Some claimed the reason for American superiority in the art was the country's superior atmosphere. Others claimed the Americans won because they were not constrained by the same patents that bound what European photographers could do with the art. Despite the reviewers' comments, as Brady and his wife made their trip across Europe, they continually saw advertisements from European Daguerreotypists who claimed they used "the American process" (Horan, 2015, p. 19). Other critics admitted that Brady's work was far superior to that of European artists.

When he returned from Europe in 1852, Brady began experimenting with blue skylights and even blue filters for his lenses. Blue filters help bring out highlights in black-and-white photography, which is presumably why Brady wanted to use them. Brady also trained in a new photography technique called *wet plate*. The wet plate technique, developed by English sculptor Frederick Scott Archer, used a chemical process to create light-sensitive glass plates that could be used to make multiple exposures. This technique would eventually make Daguerreotype obsolete. While in Europe, Brady had met Scotsman Alexander Gardner, who would eventually follow Brady to America and become part of the gallery staff. Gardner was a particularly valuable addition because of his expertise in the wet plate technique. The new process was both faster and more profitable than Daguerreotype, which allowed only one picture to

be made from an exposure. Gardner and Brady produced some 30,000 portraits annually.

Brady's success allowed him to move to bigger quarters on Bleacher Street in March 1860. This new studio was the largest and most luxurious in the city. It featured velvet drapes embroidered in gold, a frescoed ceiling, and glass chandeliers. Business grew quickly, and before long, Brady realized he needed an even larger space. He moved to the corner of Tenth and Broadway and opened a new gallery that was furnished with the most modern gas lamps and the best heating system available. The new gallery was so impressive, that in January 1861 *Frank Leslie's Illustrated Newspaper* declared that, were the facility in England, it would be named the Royal Gallery.

Given his success in New York, Brady opened a second gallery in Washington, DC, in 1858. He called that facility the National Photographic Gallery. It was in this gallery where Brady shot multiple portraits of President Abraham Lincoln, and even his son Tad. Lincoln's image on the \$5 bill is a reproduction from a Brady photograph.

By 1850, Mathew Brady, a farm boy from upstate New York, had become one of the most renowned photographers in the world. His fortunes would climax in that decade, though the Civil War would put an end to that. His reputation as a photographic historian would expand with his work as a pictorial war correspondent.

War Photography

In the 1891 interview with Townsend, Brady said he had decided to document the war because he felt called to do so by destiny. "A spirit in my feet said, 'Go, and I went' . . ." (Townsend, 1891). Going, however, meant getting the approval of military authorities as well as the War Department. Brady approached his old friend Winfield Scott, at that point commander of the Union armies, and asked for permission to cover the war at the front. Scott told Brady that he was soon to be removed from command and suggested Brady go see his replacement, General George McDowell. Instead, the photographer headed to the White House to see another old acquaintance, Abraham Lincoln, whose inauguration he and his staff had just photographed.

The president did grant Brady permission, including a handwritten pass, to cover the war—with one proviso: he had to cover all costs himself. Brady believed at the time that he would eventually be able to sell the photographic record he planned to the government and recoup his losses. That was a dreadful miscalculation. Brady would spend \$100,000 to put more than 20 teams of photographers and "Whatisit" (traveling dark-rooms) wagons in the field in the different theatres. They would shoot more than 10,000 plates. The pictures sold well during the war, but afterward, neither the government nor the public was interested in pictures of the bloody carnage that had left 750,000 Americans dead or maimed.

Not knowing what the future would hold, in early July, Brady began making preparations to head to Virginia, the anticipated site of the first major battle of the war. He equipped his black-hooded wagon with light-proof doors and walls, donned a linen duster and broad-brimmed hat and headed toward Manassas with Dick McCormick, a veteran war correspondent who had covered the Crimean War, *Harper's* artist Al Waud, and his chief darkroom assistant Ned House. As McDowell prepared his men for battle, Brady prepared his equipment to record the anticipated Union victory for history.

Unfortunately for both, the Confederates routed the Union troops, who retired from the battlefield in disarray. In the disorderly retreat, made even more difficult by the many civilians who had come to watch the battle, Brady became separated from the rest of his team. He spent the night wandering the woods. The photographer eventually made his way back to Washington after 3 days, with his plates.

Humphrey's Journal, a photography journal, commended Brady for his shots of "grim-visaged war." They wrote that his were the only reliable records of the Battle of Bull Run (Manassas). They opined that newspaper reporters were unreliable liars but that Brady could be counted on to capture the truth. The *American Journal of Photography*, in its August 1, 1861 edition, referred to him as the *irrepressible photographer*.

Brady's next major foray into the battlefield was for Antietam in the fall of 1862. With him were Alexander Gardner and Timothy O'Sullivan. The pictures they took of that bloodiest 1-day

battle of the war brought home to Americans for the first time the realities of war. Brady and Gardner traveled with General Joseph Hooker's troops, and they shot numerous pictures of dead Confederate soldiers after the battle. Gardner is credited with moving one body six times to pose it so as to capture the drama of the day. Gardner was photographing as a burial team was working to inter the dead—he may have only had the one body to work with, or he may merely have moved the body around out of convenience. In any case, the same body appears in at least six photos taken by Brady's team that day. There is no indication that this was done at Brady's instruction, but neither did he stop Gardner. The pictures taken that day at Antietam stunned Americans.

Brady went on to photograph with his teams the battles of Fredericksburg, Chancellorsville, and Gettysburg. He had a team with General William Tecumseh Sherman during the March to the Sea, both of whom were under orders from the Quartermaster to photograph all infrastructure they encountered. Brady also went back into the field during the Siege of Petersburg and photographed a duel between Confederate and Union artillery. His horse bolted when the cannon began firing, but Brady continued to shoot while under fire.

One of Brady's proudest accomplishments occurred just a few days after the war. Neither he nor any of his teams had been at Appomattox Court to photograph Confederate General Robert E. Lee's surrender. Brady had known Lee since the Mexican-American War, and he wanted a picture of the defeated Confederate commander, so he went to Lee's home and with the help of Lee's wife persuaded him to don his uniform for a picture. This is the well-known picture of Lee standing on the porch of his house (see Figure 1).

Brady also wanted a picture of Sherman after the war, but the irascible general refused to be photographed alone. He would only pose for a picture with his entire staff, and they had all scattered home to their families. Brady persuaded Sherman to come to his studio the next day at 2 p.m. if he could get all of Sherman's staff there by then. The general agreed, and Brady sent his staff scurrying to get messages to the general's staff. All agreed to participate in the picture, so Sherman arrived at the studio the next day at the arranged

Figure 1 Photograph of Robert E. Lee

Source: Mathew B. Brady/National Archives 525769. <https://catalog.archives.gov/id/525769>

time. The only problem: one of his men, General Francis Preston Blair Jr., was missing. To compound matters, a mother arrived to keep an appointment to have her 3-year-old daughter photographed. Brady asked her to wait, and she agreed. Blair did not arrive until 3 p.m., but Sherman spent the ensuing hour happily playing with the 3-year-old.

At the end of the war, Brady was deeply in debt, and the War Department refused to purchase his collection of war photographs. Brady disbanded his teams and put his images in storage. After getting the pictures of Sherman and Lee, he stopped shooting with the exception of a few photographs taken of Lincoln's funeral cortege, and a portrait of the new president, Andrew Johnson. Brady tried to make up some of his losses with an exhibit of war photographs at the New York Historical Society in 1866, but the public was not interested in pictures of the war. He kept his studio running, but he was mired in debt. In 1875, Congress purchased several thousand of his images for \$25,000, an amount that was insufficient to relieve all his debt.

Anthony and Sons, his chief creditor, took possession of his negatives. To compound matters, Brady's wife had developed a heart ailment that would make her an invalid until her death in 1887.

Legacy

Despite Brady's renown as a photographer, his finances never recovered from the Civil War. However, he continued his photography business in partnership with his nephew, Levin Handy. Handy would take the business over completely in 1896 after Brady's death. In April 1896, Brady had been hit by a street car. His death was hastened by a kidney ailment he developed later that year. Brady died alone in Presbyterian Hospital in New York City on January 15, 1896. He was buried in the Congressional Cemetery in Washington, DC.

Brady was a tireless worker and a gifted photographer. The first issue of *Photographic Art-Journal* referred to Brady as the *fountain-head* of photography. Others have also lauded his work. Brady likely would not have considered himself either a journalist or a photojournalist, yet he was both, and while much of his work has been lost, enough has survived to demonstrate the horrors not just of the American Civil War but of civil war generally.

BRAZIL

Since 1808, Brazilian journalism has demonstrated its relevance, not only to public news consumption in the largest country in South America but also in its coverage of different Latin-American and global topics. As of 2021, Brazil is classified as the ninth richest country in the world based on its gross domestic product, which reflects a country's purchasing power, current prices, and international dollars. However, this wealth was not enough to ensure job security for many journalists when economic crises struck in 2008, 2012, and 2016, changing the course of the industry throughout the country.

This entry covers the main advances in Brazilian journalism since its beginnings and highlights important aspects of this field that have arrived in the first part of the 21st century. It suggests the practice of traditional journalism is no longer enough in Brazil, as of 2021, and the field has been forced to adapt to changes, particularly those of the technological, economic, and political varieties. Brazilian publications have rapidly evolved; what was once an "opinionated" attribute of publications has given way to objectivity and more informative types of coverage. The creation of different newspapers, radio stations, and television channels has altered the course of journalism in Brazil and provided another face to the field. The increasing recognition of Brazilian journalists as serious and competent professionals signals why Brazilian journalism is important to research.

Brief History of Traditional Brazilian Journalism

In relation to journalism in other countries, Brazilian journalism had a relatively late start. In 1808, Hipólito da Costa created the *Correio Braziliense* (*The Brazilian Post*), a Rio de Janeiro newspaper that circulated in the country until 1822 and informed Brazilians about the news in the Portuguese court in Lisbon. Even though the *Correio Braziliense* is considered the first newspaper in Brazil, the publication had some particular characteristics, such as being in the shape of a book and including 100 pages in each edition. The content of the monthly publication included news

from Portugal, literature, arts, science articles, poems, and international news. Another peculiarity of this publication was its circulation, which consisted of only 500 subscribers. Because of these characteristics, the *Correio Braziliense* is considered a modern publication despite the era in which it was printed. Currently, there is another publication with the same name (*Correio Braziliense*) which was created in 1960 and continues to circulate in Brazil. This newspaper also has an online version and focuses on informing the population about national news. The newspaper often criticizes the government.

Other Brazilian publications were created throughout the early 19th century such as *A Gazeta do Rio de Janeiro* (*The Rio de Janeiro Gazette*), which differed greatly from the *Correio Braziliense*. Contrary to the modern vibe of the *Correio Braziliense*, *A Gazeta do Rio de Janeiro* was created to focus on positive news about the Portuguese Court. In a tabloid format, the publication was known as the *official* newspaper of the Portuguese Court and ran opinionated articles and a large volume of propaganda. All editions were published every Wednesday and Saturday and required approval by the court before publication. Later, after Prince Dom Pedro declared Brazil's independence from Portugal on September 7th 1822, Brazilian intellectuals created different publications with the intention of covering local news in Rio de Janeiro, the capital of Brazil at the time.

The 100th anniversary of Brazilian independence in 1922 also marked the beginning of radio transmission in the country. Radio was the communication vehicle used by the government to transmit and celebrate the independence of Brazil. Other radio stations were soon created with the intention of informing the population about local news, politics, and sports. Brazilian journalism at the time, influenced by Portuguese-style journalism, instituted a tradition of covering specific facts in an opinionated fashion, but also had the focus of informing the population while exploring both sides of a story to ensure the validity and objectivity of the text.

Attributes of Traditional and Contemporary Brazilian Journalism

Family Business

A small group of intellectuals and businesspeople created and traditionally operated the majority of newspapers, radio stations, and television channels in the country. These businesses, considered family traditions, tend to be inherited by subsequent generations in order to maintain control of the field of journalism without changing the main characteristics (such as logos, coverage preferences, and other aspects of branding and news production) of the publications.

Five families, including the Marinho, Abravanel, Macedo, Saad, and Dallevo families, are part of the intellectuals and businesspeople who control half of the 50 media markets—including newspapers, radio stations, and television channels—with the largest audience in southeastern Brazil, particularly the state of São Paulo. Media ownership information was released in a larger study conducted by the Media Ownership Monitor and subsidized by the German government in 2017. The Marinho family owns the largest media network in Brazil, with a total of 26 of the 50 largest communication markets in the country. The Marinhos opened their business in 1965 with a single television channel and over the years expanded to include radio stations, newspapers, magazines, and online platforms. Brazilian radio stations followed the same pattern of monopolization. Between 1930 and 1950, Brazil saw the creation and consolidation of the main radio stations in Brazil, creating monopolies of the market which have persisted until today.

Monopolies

When discussing traditional journalism in Brazil, it is important to highlight the fact that it had—and continues to have—monopolist tendencies. Major news companies, such as *Grupo Estado* and *Grupo Globo*, traditionally owned print journalism. With affiliated companies throughout the country, these larger outlets have the greatest market share of print journalism in Brazil. They are responsible for the coverage of national topics as well as state and local issues.

In the traditional Brazilian news environment, the media and smaller markets were responsible for a share of the market that does not have much space in the industry and is often suffocated by the power of larger markets. However, economic crises changed the course of many businesses and the larger media markets. Media outlets were forced to shed their traditional strategies to keep their doors open during and after the crises. Print newspapers were obligated to layoff workers, which caused a great impact in the field. Many journalists lost their jobs, and thousands of employees did not have any sources of income. With that, traditional journalism failed to meet information needs, and the Brazilian population met a new type of journalism.

New Directions in Brazilian Journalism

Economic crises have a tendency to promote the reinvention of journalism in Brazil, and many of the characteristics of what was once considered traditional mainstream journalism practices have been left behind. Brazil's economy grew quickly from 2004 through 2008 and then stagnated as the world sank deeply into economic recession. Along with this recession came the downsizing of traditional media, which included laying off and firing journalists. With thousands of Brazilian journalists unemployed and many seeking employment in the market, reporters, photographers, editors, and other professionals of the field created their own businesses, becoming entrepreneurs in new forms of journalism. Independent agencies created by journalists had to find ways to fulfill the information needs of the population that mainstream media could not, while surviving without assistance from the government.

In 2011, three journalists founded the independent journalism outlet *Agência Pública* (*Public Agency*), which was the first nonprofit investigative journalism agency in Brazil. Along with independent journalism came citizen journalism through the award-winning network *Mídia Ninja*, an acronym for *Narrativas Independentes, Jornalismo e Ação* (Independent Narratives, Journalism, and Action), independent stories, journalism, and action. *Mídia Ninja* began in São Paulo in 2011, covered a good deal of Indigenous activism and police injustice, and featured a livestream. In

2020, it had more than 2.5 million followers and had more than 30,000 posts.

This new means of producing journalism spread to other parts of the country and in about a year, a variety of independent media were operating throughout the country. For instance, the independent agency *Real Amazon* covers topics and issues that involve the Amazon rainforest, such as Indigenous people, property conflicts, wildfires, political, and economic issues. Another example of independent media is *Ground Zero Content*, an investigative journalism collective focused on approaching three topics: power relations, urbanism, and the semiarid northeastern region of Brazil. Other independent media focus on specific topics, such as politics, economy, and environmental issues in the country.

Independent Media Move Online

Independent media caused a revolution in Brazilian journalism. This new approach to dealing in information was an avenue through which recently unemployed journalists could continue working in the field and inform the population. More importantly, the independent media have had powerful impacts on larger Brazilian markets. With the success of the first wave of independent media, other journalists increasingly embraced the idea and moved to create their own communication channels. Smaller radio stations, podcast channels, and websites were created with the intention of informing the population about specific topics. This approach transformed traditional journalism in Brazil, as the manipulation of the news and the concentration of power in the hands of a small number of families dissipated into smaller markets that were capable of creating stories with greater details, local relevance, and accuracy. The rush of the big markets gave space to longer interviews and richer information being associated with news stories disseminated largely through websites. As of 2021, one can find opinions in journalistic articles, however they are always identified as opinionated articles so the public understands the bias.

The independent media also brought new challenges and obstacles to those working in the field. To be a media entrepreneur required many hours of work and large budgets to cover equipment,

photographers, and editing expenses. The greatest challenge regarding this new type of journalism is that the Brazilian population is not traditionally accustomed to seeking information in small markets. Although there is an increase in the number of Brazilians using online platforms to gather information, the majority of the population relies on television channels, radio stations, and print newspapers, as of 2021. To overcome these difficulties, many journalists have worked together to create websites and other online platforms, such as podcasts, to cut costs and provide accurate information to their audiences. As a result, independent media increased in its influence and more online platforms were created with the intention of spreading news and information. Print newspapers decreased their circulation and began publishing most of their content online. Television channels also created websites with their content. Radio stations soon followed suit and created online platforms to complement the traditional format.

Attacks on Journalism and the Industry's Response

A serious trend affecting Brazilian journalism includes reputational, online, and even physical attacks on journalists. Many of the government's attacks take the form of defamation and slander charges against journalists. Some attacks come from other elements in the population and have included knifing attempts on victims (e.g., staff of *TV Globo*), shooting victims (e.g., Vamberto Teixeira, Fábio Márcio), and, in the case of journalist Patricia Campos Mello, extensive and coordinated online harassment. More Brazilian journalists were attacked (and killed) between 2010 and 2020 than in the previous 20 years combined. Although the trend is distressing, collaboration and decentralization have emerged as strategies to continue coverage in what may be an increasingly hostile environment. These strategies have brought other benefits as well. While financing originally played a role in collaboration, Brazilian journalists have discovered that collaboration also increases the reach of various stories while enhancing the quality of content.

In light of journalists finding themselves increasingly under attack and discredited by Brazilian state officials, collaboration has been beneficial to Brazilian journalism. Collaboration is predicted to become a core value in Brazilian journalism in the coming years as journalists work more closely with citizens and one another. This process creates a certain transparency that may help the practice survive government-sanctioned discrediting and other attacks on the credibility of the profession.

Diversity and Journalism in Brazil

Men have traditionally dominated journalism around the world. Around 2014, Brazil began passing initiatives to not only enhance workplace diversity, but to provide databases of diverse sources for journalists to contact for information. Universities, collectives, and intellectuals have heavily promoted such initiatives. The coronavirus pandemic altered the course of history.

During the pandemic, various media outlets were forced, as they were during periods of financial crisis, to cut staff. Due to the trajectory of the spread of the virus, particularly through poorer communities, the pandemic led to a de facto de-diversification of news organizations in 2020. Yet calls for increased diversity in journalism and journalistic sources continue in 2021, as Brazil also has seen Black Lives Matter protests related to police killings, racial disparities, and injustice, much as the United States saw in 2020.

Journalism in Brazil has changed considerably over the years, particularly during the first part of the 21st century. Economic crises and changes in political paradigms have directly influenced the practice of journalism in the largest country in South America. The old-fashioned journalism practiced following the traditional American format based on objectivity with a strong lead, an impactful title, and a supportive subtitle has been replaced by less restricted formats. Journalism in Brazil has also sought diversity in voices and technologies, among journalists, sources, and formats, which have allowed for more creativity in incorporating different elements—photographs, recorded interviews, text, and illustrations—into news production. Although the influence of independent media is relatively new in Brazil, these communication channels have garnered lucrative

audiences and more people search for information on these platforms every day.

To ensure a stable future for journalism in Brazil, reporters and journalists in general may continue to invest in smaller markets and eventually build strong reputations, as media outlets in the larger Brazilian markets have over the past two centuries. Although the transformative process continues in Brazilian journalism, news consumers expect more from journalists every day. Traditional journalism has proven to be no longer enough to satisfy the increasing information needs of media-savvy and sophisticated populations.

BREITBART

Breitbart is a conservative news website that primarily focuses on American politics, media, and culture. Founded in 2005, Breitbart established itself as one of the primary voices of the emergent Tea Party movement on the American Right, focusing on stories critical of immigration, the mainstream media, and liberal influence on American culture. In 2016, Breitbart rose to mainstream prominence after becoming one of the most vocal backers of Donald Trump's successful campaign for the U.S. presidency, with former Breitbart staff moving to roles within the Trump administration after his victory.

Since establishing itself as a significant voice within American journalism, Breitbart has seen a significant number of advertisers dissociate themselves from the platform due to its controversial editorial stances as well as the departure of influential chief executive Steve Bannon, casting doubts over the future of the site. Nevertheless, the

influence of the site over a relatively short period of time renders it an important object of study for those interested in the study of alternative and partisan media, as well as those interested in media during the Trump presidency. This entry discusses the formation and history of Breitbart, its relationship to the alt-right, and its role in the 2016 U.S. presidential election.

Formation and Early Years

Breitbart was founded by Andrew Breitbart, initially as a news aggregator that would harvest links from other sites onto the main page. Within 2 years, he sought to evolve the site into a conservative version of the Huffington Post (now HuffPost), another tabloid-style website that he helped establish. Breitbart began producing his own stories that attacked not only Democratic and establishment politicians but perceptions of institutional liberal bias within American cultural institutions, mainly the mainstream media and Hollywood.

The aggressive tone of Breitbart's stories would go on to become not only a hallmark of their journalistic output but of their early journalistic practices too. In 2009, one of the earliest breakthroughs for Breitbart involved the "exposing" of the Association of Community Organizations for Reform Now (ACORN), a community-based social advocacy group for low- and middle-income people working largely within inner cities of the United States. An undercover recording appeared to show two Breitbart contributors posing as a prostitute and a pimp, attempting to seek advice from ACORN employees on how to traffic underage girls into the country, as well as how to claim government benefits for them.

The Breitbart story on ACORN caused a national controversy. Although the video was later revealed to have been misleadingly edited, and ACORN and its staff were exonerated from any wrongdoing, the organization lost the overwhelming majority of its funding and was forced to fold. Breitbart would also heavily doctor a video depicting government official Shirley Sherrod speaking at an NAACP event, professing a reluctance to provide aid to a farmer because he was white. Although this video was again misleading, Sherrod was initially fired and the NAACP was heavily criticized.

However, in spite of these occasional controversies, Breitbart remained a relatively minor and oft-unknown figure both within the American news sphere and among the American public. By the time of Andrew Breitbart's death in 2012, U.S. President Barack Obama, a Democrat, had been reelected for a second term in an election in which Breitbart struggled to challenge and influence mainstream media coverage. The site appeared to face an uncertain future, without its most important figurehead.

A Platform for the Alt-Right?

After Breitbart's death, the leadership hierarchy of the organization was restructured, during which time Bannon, a Breitbart board member since the founding of the site, was named executive chairman. Media scholars and commentators would later identify Bannon's appointment as an evolution of Breitbart's journalistic style toward one that aggressively pursued anti-immigrant, anti-globalist positions, and one that would result in Bannon later referring to Breitbart as "the platform for the alt-right." Here, it is useful to reflect on what constitutes the alt-right, the extent to which Breitbart can be seen as a platform for the alt-right, and the importance of this in relation to the influence of Breitbart upon both the media and political landscapes in the United States.

The alt-right is problematic to define, largely because various scholars, commentators, and others have attempted to group a number of conservative political ideologies under the broad banner of "the alt-right," a move that has arguably normalized political views formerly considered extreme. The most widely accepted starting point, however, is that the alt-right is a branch of right-wing conservatism that emphasizes white supremacy, as well as implicit or explicit forms of racism. Primarily an online movement that began to emerge around 2010, the alt-right rose to prominence in 2016 as the Trump presidential campaign gathered momentum, with prominent self-identifying members of the movement publicly supporting Trump's "Make America Great Again" message.

Similarly, Breitbart's association with the alt-right and white identitarianism is complicated to parse. Breitbart has at times intentionally

obfuscated their positions, identifying with particular elements of the movement and decrying others, only to alter their stance at a later date. As an institution, they have often attempted to publicly dissociate themselves from the most overt white supremacist elements of the movement, such as neo-Nazism or the Ku Klux Klan, with Bannon referring to prominent American neo-Nazi Richard Spencer as a self-promoting “freak,” as well as accusing former KKK leader David Duke of using the Trump presidency as a means of staying in the public eye. However, Breitbart published a piece in 2016 titled “An Establishment Conservative’s Guide To The Alt-Right” that softened elements of the movement (the article characterizes one subgroup by comparing it to “the more reasonable white identitarians”) while affirming that many alt-righters “would rather [neo-Nazis] didn’t exist” (Bokhari & Yiannopoulos, 2016).

The combination of Breitbart’s appeals to some elements of the alt-right movement combined with their refusal to promote outright white supremacy, as well as a larger difficulty with trying to effectively categorize the alt-right, have led many to consider Breitbart as part of what has been termed the “alt-light.” Presenting as separate from both mainstream conservatism and the extreme elements of the alt-right, the “alt-light” will often publicly repudiate the most extreme white nationalist elements of the alt-right movement, while offering support for other parts of the movement, such as strict anti-immigrant policies. By presenting themselves as distinct from the alt-right, but willing to engage with some ideas offered by extreme elements of the Right, the alt-light can traverse both mainstream and fringe political discourses, providing channels for extremist ideas to enter the political mainstream.

Role During the 2016 Election

It is difficult to overstate the level of support that Breitbart provided to Trump over the course of his 2016 election campaign. While Trump’s upset in the general election against Democratic candidate Hillary Clinton is widely remembered, it is perhaps less well-remembered how Trump emerged from a large Republican field in the primaries to become the nominee and how Breitbart assisted him in doing so.

Trump initially distinguished himself from the rest of the field in a campaign speech that depicted the United States as a failing power on the world stage, directing anger at the politicians who had allowed this to happen, as well as immigrants from Mexico whom he referred to as “rapists” as well as “bringing drugs and crime.” Breitbart soon began to back Trump explicitly over many of the more moderate Republican candidates, not only in terms of positive coverage for his campaign but by making overt attacks on candidates who were depicted as part of the Republican establishment and out of touch with the feelings of the average American citizen. These emotional, populist appeals to “left-behind” voters perfectly aligned with the anti-globalist, anti-immigrant politics of Breitbart and galvanized Trump as a candidate distinct from the rest of the Republican field.

Having secured the Republican nomination, in August 2016, Trump hired Bannon as the chief executive of his campaign. Breitbart and Trump continued a similar strategy in the campaign against Hillary Clinton, by attacking her—as well as her husband, former President Bill Clinton—as part of the elite American political establishment who had failed the American people. Additionally, Breitbart began to increase attacks on mainstream media institutions, whom it routinely depicted as inherently biased toward Hillary Clinton instead of adhering to traditional norms of journalistic impartiality. These attacks were echoed by Trump, who routinely argued that he received unfair treatment from the press in comparison to Clinton. Not only did this affect conservative media outlets’ coverage of the election, which largely echoed Breitbart’s attacks, but it pressured mainstream media into drawing equivalencies between Clinton’s indiscretions and Trump’s. In this way, Breitbart was significantly influential in altering perceptions of Trump and Clinton in ways that reached far beyond its online audience. Trump’s eventual victory was not only celebrated as a political victory for Republicans but as a major triumph for Breitbart and conservative alternative media over established mainstream media institutions.

Breitbart Today

After the 2016 election, it appeared that Breitbart would continue ascendant for the duration of Trump's inaugural term, and possibly further beyond. Bannon was hired as Trump's chief strategist and special counsel, while contributors Julia Hahn and Sebastian Gorka also took positions within the Trump administration, forging an even closer link between the organization and the president. Yet as the administration was engulfed in controversies, from speculation over Russian interference in the election to backlash over Trump's draconian immigration policies, the relationship between Bannon and Trump began to deteriorate.

Press speculation over Bannon's disdain for many of Trump's White House staff, alongside Trump's resentment for Bannon receiving too much credit for his role in the administration, saw Bannon allegedly fired from his post in August 2017. Bannon returned to Breitbart but stepped down swiftly in January 2018 after it was revealed that he had spoken to author Michael Wolff for the book *Fire and Fury*, an insider account of the Trump White House in which Bannon referred to Trump's meetings with Russians before the 2016 election as "treasonous." By the spring of 2018, Bannon was doing consulting work for far-right political parties across Europe as part of a wider effort to further the nationalist-populist cause and was no longer involved with Breitbart in an official capacity.

Bannon's departure has led some to speculate that Breitbart has subsequently pursued a slightly more subdued editorial tone, but it is far from the only reason that Breitbart has attempted to tone down. Another reason was the emergence of the Sleeping Giants group, an activist organization that lobbies advertisers to boycott right-wing news sites such as Breitbart, which has significantly impacted Breitbart's economic viability. Additionally, algorithmic changes to Facebook's News Feed have limited the number of people that Breitbart can reach with their content, making their product less valuable to the advertisers that are attracted to them. There are signs that this shift in tone has benefited Breitbart.

As of late 2020, Breitbart found itself in an unusual position. It could no longer easily claim to

be a brash voice outside the echelons of mainstream American journalism, considering its close links with the administration of a sitting U.S. president. Nor could it—or would it want to—legitimately claim to be part of that mainstream, as much of the mainstream press was fundamentally at odds with Breitbart's predominantly pro-Trump messaging. Perhaps most crucially, by 2020, Breitbart was no longer the only outlet willing to bridge the ideological gap from the alt-right into mainstream Trumpian politics.

Numerous competitors have emerged online, each willing to put forth similar anti-immigrant, "pro-Western" views that mirror the output of Breitbart under Bannon. Even mainstream broadcast outlets such as Fox News have been accused of shifting further to the right in order to appeal to viewers who see traditional conservatism as too liberal. Whatever the future holds for Breitbart, it is perhaps its success in shifting conservative politics and conservative media in the United States toward an overtly nationalist-populist stance, as well as undermining public confidence in American mainstream media, that will be its lasting legacy.

BRITISH BROADCASTING CORPORATION

The British Broadcasting Corporation (BBC) is a British public service broadcaster, comprising television, radio, and other electronic media outlets whose primary mission is to serve public needs for information and entertainment. Established by Royal Charter in 1922, the BBC is the world's oldest broadcaster headquartered at Broadcasting House in Westminster, London. It is also among the largest broadcasters in the world, employing more than 28,500 staff in 2019. Operating under an Agreement with the Secretary of State for Digital, Culture, Media and Sport, the work of the BBC is primarily funded by an annual television licensing fee paid by companies and British households that use any type of equipment to receive or record live broadcasts. The BBC's domestic broadcasting services are financed by television licenses and the government sets the level of the license fee, which is also used to fund the BBC's television, radio, and online services that cover United Kingdom, nationally. This also funds the BBC World Service, which broadcasts internationally in 28 languages, reaching an average of 279 million people a week in 2020.

The BBC has a governing body called the BBC Trust, which issues a service license to every BBC service and sets the key direction through four strategic objectives for the BBC. It works to uphold the independence and standards of the

corporation. As a body it is separate from the BBC executive body that manages the key delivery of BBC's services and is led by the director general. This entry discusses the growth and evolution of the BBC from a radio company to a globally influential broadcaster. In the process, it also traces many milestones and controversies that have contributed to its expansion and reputation.

Founding Years: Establishing a Presence

Renowned for its high journalistic standards, the BBC plays an important role in the lives of British people as well as loyal listeners around the world. Colloquially referred to as Auntie Beeb or The Beeb, it has been described as the most visible international identity of any British institution. It is a curious behemoth, being a conglomerate while remaining in the public sector with a worldwide reputation for its programs and reportage. John Reith, a Scottish Calvinist, appointed general manager in 1922, a few weeks after its first official broadcast, set what is known as the Reithian directives and which the BBC still follows—inform, educate, and entertain.

From the beginning Reith was keen that the BBC remained a public service entity rather than a corporate or commercial one. The 1926 general strike in the United Kingdom proved to be a turning point in the growth of the BBC. Called by the General Council of the Trades Union Congress, it was an unsuccessful attempt to force the government to implement better working conditions and wage protection for the beleaguered coal miners. The government was ready and ensured that essential services were not hit, but the production and printing of newspapers was affected in a way that left the BBC as the main source of news. There was a bit of a tussle between Winston Churchill, who wanted to use the broadcasting prowess of the BBC to best advantage, and Reith, who wanted to postulate an impartial character to the BBC. The coverage of the miners by the BBC impressed the public who were largely unaware that broadcasts from the Labor Party had been banned by government orders. The miners nicknamed the BBC the "BFC" for British Falsehood Company. Official BBC Historian and Professor of Media History, Jean Seaton, has described this

as the start of “modern propaganda in its British form” (Curran & Seaton, 2003). Churchill remained one of the BBC’s fiercest critics, and much had been written about his battle with the entity. Feeling excluded from the airwaves prior to World War II, Churchill “complained that he had been very badly treated . . . and that he was always muzzled by the BBC” (Robinson, 2012). This has largely been considered the motive behind the Television Act 1954 that permitted the creation of ITV, Britain’s first commercial network, which is today considered a competitor.

In its long and distinguished history, this was the earliest controversy the BBC faced but it certainly was not the last. Arguments over its impartiality has risen since 1927, the time it became a public body. During the Cold War, the BBC had MI5 (United Kingdom’s domestic counterintelligence and security agency and is part of its intelligence machinery) officers vetting applications. As a 2006 report in *The Observer* said, various secret files showed that when the conflict with the Nazis was at its zenith, the BBC was infused by anti-communist suspicion bordering on paranoia to remove so-called subversives. Documents later made public by MI5 show that folk singer Ewan MacColl and his wife and theatre producer, Joan Littlewood, had been banned. Scholars have compared this to the CBS newsroom at the height of McCarthyism in the United States.

Reith’s legacy is not without its fair share of quibbles either. In her 2006 book *My Father—Reith of the BBC*, Marista Leishman, his daughter, said that he banned the playing of jazz music on the BBC, writing a diary entry that said, “Germany has banned hot jazz and I’m sorry that we should be behind in dealing with this filthy product of modernity” (Leishman, 2006, p. 148). This had little impact on the prominence of jazz, which as a 2019 survey showed was beating classical music in audience preferences. During the war, there was strict censoring of music from Axis nations. Today, the organization has an extremely strict stance on editorializing matters whether on air or on social media. In 1933, Vernon Bartlett’s on-air commentary on the Nation’s Disarmament Conference invoked intense criticism leading to his resignation.

The BBC has been criticized as being supportive of elite views long before the 2019 Naga

Munchetty controversy, in which the celebrated presenter of programs like *BBC Breakfast News* was reprimanded for her comments on racism. In 1965, *The War Game*, a British pseudo-documentary film on nuclear war and its devastation, written and directed by Peter Watkins, was withdrawn because its contents were deemed much too alarming to be broadcast. In 1967, the film won an Academy Award for Best Documentary Feature. Despite such complaints, the BBC remains one of the most trusted sources of news in the United Kingdom. For example, during major incidents with global ramifications, such as the 2005 London bombings, audiences turn overwhelmingly to the BBC.

While these incidents may seem against the spirit of unbiased reporting that the BBC adopts, impartiality, for the BBC, is extremely important. Reith, in his book *Broadcast Over Britain* (1924), had mentioned that persuading the public about concepts of impartiality would not be easy but was extremely necessary. These views were amply supported by Tony Hall, who was director general from 2013 to 2020 and believed that in how the venerable conventions of journalism work under the pressures and demands that changing times bring must be considered. Perhaps, the 1940 explosion that rocked the building while Bruce Belfrage read the 9 p.m. news is an indicator of the way the organization values news and audiences. Seven BBC staff members were killed. Audiences heard the explosion as Belfrage paused for a moment in the dust-covered studio before completing the bulletin.

The BBC has grown not just nationally but internationally as well with its World Service. The BBC News is the largest newsgathering procedure in the world. This system provides service to network services such as the BBC News service and BBC World News. To reach audiences and increase its reach, the corporation has applications, podcasts, and its famed BBC Mobile as well as email and other digital alerts.

To ensure seamless service, the BBC has built a strong online presence that includes an easy-to-search archive and a well updated website, which has grown from the BBC Networking Club, its first online service launched on May 11, 1994. BBC figures say that this is Europe’s most popular site, visited by millions in the United Kingdom

alone. The site is funded by licensing fees, but advertisers can display ads that can be viewed by audiences outside the United Kingdom and Europe.

Constituting International Services

The world's largest international broadcasting service, BBC World Service, is owned and operated by the BBC. Funded by the profits of BBC Studios, the United Kingdom's television license fee, and limited advertising, the BBC broadcasts in over 40 languages, reaching an average of 279 million people, per week, via television, radio, and online. This licensing fee has often been criticized by other broadcasters as being unfair advantage that prevents fair competition. This service that broadcasts 24 hours was inaugurated December 19, 1932, as the BBC Empire Service. At the outset, not much was expected from this and Reith had his doubts, thinking that they may not be very intriguing. The first disruptions to the service happened in 1985 due to protests when workers rallied against the British government's decision to ban the documentary featuring an interview with Martin McGuinness, the Irish republican Sinn Féin politician who was the deputy First Minister of Northern Ireland from May 2007 to January 2017, but the project reconvened and recent figures show that it returned profits amounting to £210.5 million to the BBC.

Today, the BBC World Service encompasses a 24-hour English global radio network and other services in 27 other languages. Most of these programs are available on the BBC website and mobile applications. As its website says, its primary role is to use BBC brands and shows to build its reputation among audiences and champion British creativity globally. The UK government allocated the service £289 million (over a 5-year period ending in 2020), and in its largest expansion since the 1940s, in November 2016, the BBC announced that it would start broadcasting in languages like Amharic and Igbo. In 2017, figures from the BBC showed that the BBC Natural History, premium drama, and local adaptations of hit UK shows were globally its most popular programs. Besides, the impact of *Planet Earth II*, *Sherlock* and *Doctor Foster* can be felt

in different parts of the world. For example, *Father Brown* and *DCI Banks* are popular in Sweden. News is at the core of BBC's identity. The *Global News* podcast is broadcast twice a day, and figures from the BBC show that it was downloaded more than 300 million times.

In Africa, the BBC World Service website lists 80 FM stations broadcasting content from the United Kingdom, South Africa, Ascension Island, Cyprus, and the BBC Atlantic Relay Station with much of the schedule focusing on Africa-specific programs like *Africa*, *Have Your Say* and *Focus Africa*.

In Asia, the largest audiences are those listening in the languages of English, Hindi, Urdu, Nepali, Bengali, Sinhala, Tamil, Marathi, and other major languages of South Asia. But censorship in Russia, Iran, Iraq, Burma, and China have often resulted in BBC World services, especially programs cast in English and Mandarin, being jammed. In a 2012 World Service submission to the Foreign Affairs Select Committee inquiry into the Foreign and Commonwealth Office's Performance and Finances, the BBC had included a section on media freedom and noted that "concerns have been growing about the global threat to impartial and independent news through censorship and intimidation" (p. EV 52). Strict censorship at the BBC existed during World War II when nothing could be added to predecided news casts. Its wide radio channels across Europe were used to transmit American broadcasts across Europe.

Strong Regional Broadcasting

When the Second World War broke out, the BBC replaced its national regional programming with a single channel called the BBC Home Service. The BBC's international broadcasts are popular, but as a broadcasting organization, it also has a strong focus on regional programming. In the document *Extending Choice*, its preliminary contribution to the public debate, the corporation unambiguously stated that the BBC is the British Broadcasting Corporation, not to be mistaken as the London Broadcasting Corporation. It made clear that keeping in touch with the views, changing tastes, and priorities of audiences throughout the United Kingdom was imperative and that programming

had to reflect the diversity that different regions and cultures in the country had.

In July 2020, the organization announced that nearly 450 jobs in its English regional TV news and current affairs, local radio, and online news were to be cut. New program changes are also on the chopping block. The magazine program *Inside Out* will be replaced by 30-min investigative episodes made in Newcastle, London, Birmingham, Leeds, Bristol and Norwich.

Important Milestones

CNN has described the BBC as “one of the biggest commissioners of content in the world and an important global launching pad for seminal shows and creators from Dr. Who to Phoebe Waller-Bridge (Gold, 2020).” With 75 bureaus in the world, the BBC has many milestones to its credit beginning from its first broadcast in 1922 to its television launched in 1936 but suspended till 1939 for World War II. It was among the earliest broadcasters in 1948 to televise the Olympic Games. Its live broadcast of the coronation of Queen Elizabeth II in 1953 was watched by more than 27 million people. In July 1985, the BBC Live Aid concerts were among the largest satellite link-ups with an estimated global viewership of 400 million viewers. In 1951, *The Archers*, the world’s longest running drama with over 19,200 episodes, first aired. In the *EastEnders*, on air since 1985, the BBC used concepts of entertainment and education to talk about AIDS and its aftermath. The BBC aired in color in 1967. In a recent report, the Office of Communications (Ofcom) said that the BBC must do much more to ensure relevance to audiences that are used to YouTube and social media for news.

Young people are an important aspect of the BBC and few organizations have done as much as the BBC to bring computers, coding, and programming to young people in the United Kingdom. In 2015, BBC launched the Make it Digital, a major UK-wide initiative focused on encouraging young people to create digital products. Aimed at addressing the severe digital skills shortage, the project ensured that school students in England and Wales received a micro:bit, a pocket-sized codable computer, developed by the BBC to become more active media consumers. Created in

conjunction with 29 other organizations, the BBC worked with Computing at School to equip teachers with the skills to use micro:bit effectively in classrooms.

In keeping with the times, on April 2020, the BBC announced that it will provide daily programming comprising quizzes, articles, podcasts, and other children’s lessons to help students with schoolwork during the COVID-19 pandemic lockdown. The BBC has collaborated with companies such as the Royal Shakespeare Company and Puffin Books to support education in the United Kingdom. This is among the largest education efforts the BBC has ever initiated.

The BBC is also following and seeking out audiences online and on social media. The BBC’s approach to social media has been visual, and through the BBC shorts, short 15-second videos about trending stories, the organization plans to draw viewers to social media sites such as Instagram, Twitter, and Tumbler. A 2019 Ofcom report has stated that audiences on social media seek out the BBC as a reliable and authoritative source of news often giving BBC news and stories more likes and shares than *The Guardian*, its nearest competitor. Although comments online are almost always positive, audiences tend to vent about current affairs rather than the stories posted on social media. As its presence on social media show, the BBC appears to be valued for its documentaries and humanistic coverage of issues. The BBC’s famed impartiality is present online as well, as personal views and editorializing are not allowed online. It has a very strict approach to trolls especially in the sports section, stating that they will block offenders and report issues to the authorities, in a special move to maintain and ensure equality in the coverage of sports, including women’s sports.

Criticisms of Relevance

Yet the BBC’s in-depth reporting, investigative journalism, holding officials accountable, creative programming and reflecting the diversity of the country is important in the current polarized and uncivil environment. Politics is more populist, and streaming services and over-the-top media platforms are posing a serious challenge to the ways audiences consume news. Many have asked, Is the BBC still

relevant and how is it poised to handle the disruptions of the digital age? The BBC's losses provide impetus to those opposed to the public service model of broadcasting. In its early years, its competition was the concert halls and other media like theater and the recording companies. Today, its closest competitors are other broadcasters such as CNN, ITV, Channel 4, Sky PLC, and Viacom.

Once accused of dismally underserving minority populations, the organization has emerged a strong supporter of diversity. The BBC announced in June 2020, that it plans to spend \$124 million on more diverse programming. Now the corporation has a rule that as of April 2021 all new programming must have at least 20% diverse talent. Apprenticeship programs have been expanded to appeal to those from all backgrounds and include 10% differently abled people. Emphasizing their dedication to diversity and representation, the BBC Director-General has also, recently, made clear that the strength of the BBC lies in its breadth and reach in the United Kingdom, which puts it in a unique position to lead and show by example how to address and work with the demands of changing times and effect true and lasting social change.

BRITISH BROADCASTING REGULATION

Regulation has played a major role in the development of British broadcast journalism. In a number of areas, British broadcasting regulation has been more rigorous and extensive than that in other Western democracies. British regulators have set high standards for broadcast content—not only in traditional areas for regulation such as taste and offense (the portrayal of sex and violence, offensive language) but also in journalism—requiring broadcast news and current affairs to be both accurate and impartial.

As well as setting content standards, regulators have also been closely involved in determining the structure of British broadcasting and assessing the quality of its program output. Regulation has extended to the scheduling and length of news programs, their resources and budgets, as well as the amount of current affairs programming. At the same time, the regulatory bodies, in a country that does not have the same constitutional protection of freedom of expression as the United States, have had to maintain their own independence from political and commercial influence and protect the independence of the broadcasters.

For much of the 20th century, this approach to broadcasting regulation helped ensure high programming standards in both publicly funded and commercial broadcasters. The benefits of this competition were most clearly seen in journalism, where the British Broadcasting Corporation (BBC) and its commercial counterparts were encouraged to devote substantial resources and air time to high-quality journalism. But with the growth of a more competitive media market in multichannel television and online media at the end of the century, the traditional British model came under severe pressure, and the role of regulation in commercial broadcasting began to weaken, although it continued to have a major role in publicly

funded broadcasting such as the BBC. The implications for British broadcast journalism were significant. This entry opens with a discussion of the BBC, and then examines commercial television, independence and impartiality in British broadcasting regulation, as well as harm and offense standards. The entry also comments on the effects of multichannel television with respect to regulation, a 21st-century shift in the structure of regulation, and editorial and managerial scandals that led the BBC into crisis. The entry closes with a look at the structure of regulation recommended by a government-appointed independent committee and its implementation.

The BBC

British broadcasting regulation began in 1926 with the first BBC charter. The BBC at the time had a monopoly on radio, and politicians wanted to ensure that it could not be captured by any special interest. The BBC charter gave the job of regulating to the BBC Board of Governors, 12 men and women appointed by the Crown on the advice of the government to ensure that the BBC was properly managed, that its programs met the required standards, and that it remained independent. The charter was renewed and reviewed every 10 years until the replacement of the governors by a new body—the BBC Trust—in 2006.

From the start, the BBC was expected to be impartial in its coverage of public affairs and not broadcast its own or its staff's opinions. Impartiality became an essential part of the BBC's culture, and the governors were responsible for regulating it. The 1996 charter reinforced this by formally requiring the governors to ensure that controversial subjects were treated with due impartiality, but it was only making explicit a requirement that had existed for more than 70 years.

The governors combined these regulatory responsibilities with the strategic direction of the BBC—hiring and firing the director-general (chief executive) and approving the BBC's budget. Constitutionally, the governors *were* the BBC, putting them in the unusual position of being both regulator and part of the organization they were regulating. This led, at the end of the century, to growing criticisms that their regulation of the BBC was insufficiently independent and rigorous—that in

arguments over BBC news coverage, for example, or the way the BBC's growing commercial activities affected its competitors, the governors had been “captured” by the management and would support it against valid outside criticism.

Commercial Television

The arrival of commercial Independent Television (ITV) in Britain in 1955 meant the BBC faced competition for the first time. A separate regulatory structure was created to ensure that the new commercial stations were in some ways as tightly regulated as the publicly funded BBC. Initially, the regulators—first the Independent Television Authority and, from 1972, the Independent Broadcasting Authority (IBA)—were legally the broadcasters and had the right to decide what could be broadcast. The regulators also had enormous power over the regional companies that made up the ITV Network. The regulators awarded and renewed their licenses on the basis of the companies' promises to deliver high-quality programming in areas such as regional and national news, education, current affairs, and documentaries.

The regulators would set quotas for the amount of programming in different categories and for the amount of regionally based production—local news and documentaries, for example. In addition, the commercial broadcasters were subject to the same content regulation as the BBC in areas such as taste and offense—as well as the same obligations of accuracy and impartiality in news.

When a second commercial channel—Channel 4—was launched in 1982, it was again subject to tight regulatory control. Although its role was to innovate, it was also clearly part of public service broadcasting. The regulator set out the channel's program content in some detail, including the minimum amounts of time to be devoted to different genres—such as news, documentaries, and education. The result was the launch of Channel 4 News in 1982, a 50-minute-long nightly news analysis program combining news and current affairs that rapidly became one of the channel's iconic programs.

When the license for the third commercial broadcaster—Channel 5—was awarded in 1996, the regulator gave the license to the company that had the most ambitious news plans, and *Five*

News, with a new, informal, style of presentation, rapidly became one of the key programs on the new network. The *Five News* newscaster, Kirsty Young, the first woman to be the principal newscaster of a UK network, presented while perched on a desk in the newsroom or walking around, rather than seated behind a conventional desk on a conventional news set. *Five News* also made more use of video diaries and user-generated content than its competitors. Both of these new news services were subject to the same regulatory obligations on impartiality.

A similar regulatory model was adopted when commercial radio was introduced into the United Kingdom in 1973. Licenses were awarded on promises of performance, and stations were encouraged to provide current affairs programming and news as well as music. Radio journalism too was required to be impartial.

In 1990, the Broadcasting Act set up two new regulators for commercial television. The Independent Television Commission (ITC) took over most of the IBA's functions but no longer had the right to censor programs before they were broadcast. And somewhat confusingly, the ITC had to share responsibility for content standards and complaints with a new, separate regulator, the Broadcasting Standards Council, whose authority was also extended to hearing standards complaints about BBC programs (except for those related to impartiality and accuracy). Radio received its own regulator, the Radio Authority. The multiplicity of commercial regulators was all replaced in 2003 by a new single regulator, the Office of Communications (Ofcom).

Independence

A key objective of British broadcasting regulation, in addition to high programming standards, is independence. The BBC governors and the members of the various commercial regulators were mainly independent figures from the professions—such as lawyers and academics, business executives from media and nonmedia industries, and people with experience in creative arts, such as writers and directors—rather than politicians. They were expected to operate in the public interest rather than as representatives of any party. As politicians became more aware of the growing

influence of television, from the 1960s onward, there were tensions between broadcasters and the government that often found expression in arguments over regulation.

Generally, regulators tried to maintain their own independence as well as that of the broadcasters, but there have been occasions where they were seen to bow to government pressure, particularly over coverage of the tense political and religious situation in Northern Ireland. In 1978, the government of James Callaghan persuaded the IBA to use its powers of pretransmission censorship to pull from the schedule a current affairs documentary by Thames Television, the biggest ITV company at the time, on allegations of ill treatment of suspected members of the Irish Republican Army (IRA) in the Castlereagh interrogation center in Northern Ireland.

In 1985, the BBC governors, under pressure from the government of Prime Minister Margaret Thatcher, previewed and stopped transmission of *At the Edge of the Union*, a documentary that featured the Sinn Fein leader Martin McGuinness. Sinn Fein was the political wing of the IRA and McGuinness, as well as being a prominent figure in Sinn Fein, was also believed at the time to be an IRA commander. The decision of the governors led to a protest strike by BBC staff. At the insistence of the director-general, who argued that as editor in chief of the BBC the final decision was his, the program was later broadcast.

On other occasions, the regulators stood firm. In 1986, the IBA defied a government request to ban the transmission of *Death on the Rock*, a current affairs documentary by Thames that challenged the official version of the killing by British security forces of three IRA terrorists in Gibraltar. In 1988, after the Thatcher government had failed to persuade the broadcasters and the regulators to stop programs carrying interviews with members of Sinn Fein, the government bypassed the regulators and ordered a ban on Sinn Fein and other republican voices heard on the airwaves. The broadcasters, with the support of their regulators, continued to interview republicans, but had their words voiced by actors. The ban was eventually lifted in 1994.

In 2003, the BBC governors backed a BBC broadcast that alleged that Prime Minister Tony Blair's government had deliberately misled the

public when it claimed before the Iraq War that Saddam Hussein had weapons of mass destruction. The BBC's source, a government scientist, Dr. David Kelly, was revealed and committed suicide. A judicial inquiry into the affair by Lord Hutton found that the most damaging part of the story—the allegation of dishonesty—was untrue. The BBC's management and governors were severely criticized. The publication of the Hutton Report in January 2004 provoked the biggest crisis in the BBC's history. Gavyn Davies, the chairman, resigned on the day of publication. The next day, Greg Dyke, the director-general, resigned, having failed to win the full support of the Board of Governors.

Impartiality

One of the most striking characteristics of British broadcasting regulation is its insistence that news and current affairs should report on controversial subjects with *due impartiality*—that is, not show any bias in favor of any argument or party. This obligation was actively policed by the regulators, who also acted as the final court of appeal in the event of any complaint that a program had failed to show impartiality. The BBC governors and their replacement, the BBC Trust, were responsible for impartiality on the BBC; the commercial regulators had similar responsibilities for all other broadcasting.

Impartiality was an essential part of the culture of British broadcasting from the start and continued to be a key value into the 21st century. It was recognized and appreciated by the audience—surveys of public opinion show that broadcast journalism was far ahead of print journalism in its reputation with the public for accuracy and fairness. As trust in many British institutions and professions—including politicians—declined in the last quarter of the 20th century, public trust in broadcast journalism remained high. In 2004, a major independent review of UK government communications by Bob Phillis, the chief executive of the Guardian Media Group, reported research that showed 74% of the British public trusted television newscasters to tell the truth, compared with 36% for civil servants and 29% for business leaders. The report also pointed out that in the 2003 Iraq War, 70% of the British

public thought television news was the most trustworthy source of information, compared with 14% for radio and just 6% for newspapers.

The notion of impartiality is a controversial one. Some critics argue that it is unachievable—that what the broadcasters call *impartiality* is simply their preferred bias—though critics disagree over whether the bias is too liberal or too conservative. At the start of the 21st century, a new criticism of impartiality arose—that it was irrelevant in a world of multiple news sources where plurality mattered more than impartiality. It was argued that impartiality rules should only apply to the traditional UK public service broadcasters and not to foreign news channels such as Fox News and Al Jazeera.

Harm and Offense

British broadcasting regulation has always set content standards in areas such as harm and offense—bad language, portrayal of sex and violence, the protection of children from inappropriate content at times when they were likely to be watching television—as well as fairness in the way broadcasters behave regarding issues such as respecting individuals' right to privacy and proper treatment of interviewees and contributors. The regulators' role has been to try and strike a balance between freedom of expression and the rights of broadcasters to be creative and experimental. They and the broadcasters evolved a system of programming codes and guidelines to make clear what was permitted, and the regulators acted as the court of final appeal in the case of complaints about programs.

The regulators also have the role of policing the “watershed” in British television. This is a rule that material unsuitable for family viewing is not shown on broadcast channels before 9:00 p.m. In making their judgments on taste, the regulators have always taken into account the time at which programs were broadcast and the likely composition and expectations of the audience.

Regulators have substantial powers to punish broadcasters who break their codes and guidelines. They can require the offending program to be re-edited, prevent its retransmission, and, in many cases, fine the broadcasters. They are particularly concerned about the honesty of

broadcast journalism. In 1999, the ITC fined Carlton Television, a leading ITV company, the record sum of £2 million for broadcasting *The Connection*, a documentary on the cocaine trade that had faked a number of sequences.

The End of the Duopoly

The unique British experiment in regulating all broadcasting as a public service could only exist as long as there was effectively a duopoly of the BBC and the commercial broadcasters, who in turn enjoyed a monopoly on advertising revenue. The arrival of multichannel television—particularly Rupert Murdoch’s BSkyB in 1990—changed that stable situation, as satellite and cable television services were subject to much lighter regulation. The commercial television regulators were responsible, however, for ensuring that news programs on multichannel television (such as Sky News, the first 24-hour British news channel) met existing national standards for impartiality.

Margaret Thatcher’s 1980–1991 government used regulation to inject further competition into what it saw as a complacent and overmanned industry. The 1990 Broadcasting Act marked the beginning of the end of the long British experiment in public service broadcasting. The new commercial regulator, the ITC, was given the job of awarding new ITV licenses when they came up for renewal in 1992, not on the basis of program promises, as in the past, but in a blind auction where once a minimum-quality threshold had been met the highest bidder received the license.

The new ITV companies lobbied the ITC to be allowed to make cost savings through mergers and to be relieved of the most expensive of their surviving public service obligations. By 2003, ITV in England and Wales was one company. Although some programming obligations remained, these were seen as living on borrowed time as Britain moved toward its digital transition (planned for 2008–2012) at the end of which, the ITV companies argued, their licenses were no longer worth enough to justify providing expensive programming such as regional news. They had agreed to invest in these genres when their licenses, in an era of spectrum scarcity, gave them a near monopoly of television advertising. The move to digital meant that their competitors could take channels

on the new platforms without having to make expensive promises to the regulator.

In the new, more commercial environment, regulators allowed broadcasters, particularly ITV, to cut back on their commitments to news and current affairs. ITV lost its dominant position in regional news to the BBC. ITV also fought a long battle with the regulators in the 1990s to move its most successful network news program, *News at Ten*, from its regular weeknight slot to make way for entertainment programming. The move proved a disaster for ITV, which eventually restored the news to its traditional slot in 2008, by which time it had lost much of its news audience to the BBC.

The New Age of Regulation

At the start of the 21st century, two new institutions were created that marked a significant shift in the structure of British broadcast regulation. In 2003, the Blair government (1995–2007) set up a new telecommunications and broadcasting regulator, the Office of Communications, or Ofcom. This agency policed surviving public service obligations such as regional production quotas and was given an overarching role as a “converged” regulator, to consider long-term policy in the telecoms and broadcasting fields as the two industries came closer together. It was responsible for all content standards in commercial television and all standards, except impartiality and accuracy, for the BBC.

Ofcom published a series of far-reaching reviews of public service broadcasting from 2004 to 2008 that suggested a difficult future for commercial broadcast journalism. In particular, in its analysis of the future of news in 2007, it put forward that ITV, the main commercial channel, would not be able to afford regional news in the long term. Ofcom offered various options for broadcast financing in the future—including the possibility of some of the BBC license fee being “top-sliced” (taking some of the license fee income that had always been given only to the BBC and giving it to Channel 4 and others) to help subsidize commercial public service broadcasters.

An equally significant change took place in BBC regulation. When the BBC’s charter was renewed in 2006, the governors were replaced by a new body, the BBC Trust, tasked with

representing the interests of licence fee payers (the British audience) and being more clearly independent of BBC management. It retained the governors' old responsibility for accuracy and impartiality.

The new system's first real test was a series of scandals in 2007 involving dishonest programming by both BBC and commercial broadcasters. Radio programs had been broadcasting faked calls from viewers. The results of television competitions had been rigged. Viewers had been encouraged to take part in phone competitions (and charged high tariffs for the privilege) when the competition had already closed and their calls had no chance of winning or being counted.

Ofcom and the BBC Trust both commissioned independent investigations into what had gone wrong. A number of producers lost their jobs; commercial companies and the BBC were fined; and new and tougher guidelines and rules were introduced. The scandals did not involve journalistic programs, and public trust in broadcast journalism was not undermined.

BBC in Crisis

However, a few years later, the BBC Trust was itself overwhelmed by editorial and managerial scandals. In 2012, one of the BBC's most famous entertainment figures, Jimmy Savile, was exposed to have been a serial pedophile, raping and abusing hundreds of children he met through his BBC work over a period of more than 20 years. Savile had died in 2011 and his victims began to tell their stories. BBC journalists on the main news analysis program, *Newsnight*, had started work on an exposé, but their editors had stopped it. ITV then took up the story and transmitted a documentary on Savile that was seen as the journalistic scoop of the year. To make matters worse, another team on the same *Newsnight* program then falsely implicated a wholly innocent politician in an unrelated sex abuse scandal. The BBC's newly appointed director-general, George Entwistle, was forced to resign after 54 days on the job. Independent investigations cleared the BBC management of deliberate cover-ups, but were highly critical of the decision not to run the story and of the BBC's failure over many years to spot the evidence of what Savile had been doing. The BBC management and

the Trust then came under further fire for their handling of a controversial series of senior executive pay-offs and the apparent lack of control and accountability. A UK parliamentary committee, which investigated the debacle in 2013, concluded that the BBC's governance system was broken.

A New Structure

The government appointed an independent committee to recommend a future structure. It proposed that the Trust be replaced by a unitary board of executives and nonexecutives which would manage the BBC, with Ofcom as the external regulatory responsible both for its overall strategy and its editorial content, including the accuracy and impartiality of its news and current affairs. This was an historic decision for BBC journalism. It meant that for the first time, the BBC was no longer the final arbiter of the impartiality and accuracy of its news coverage. The new system took over in 2017 with the start of the BBC's renewed 10-year charter and began with some signs of strain. Sharon White, the chief executive of Ofcom, noted a fundamental tension in the relationship between Ofcom and the corporation. However, Ofcom's early decisions did not suggest, as some had feared, that it would curb the BBC's editorial independence. It defended the BBC's journalism from complaints by pro-Leave politicians about its coverage of Brexit after the 2016 referendum. Its first review of the BBC's journalism, in 2019, was notable for criticizing the BBC for not being bold enough in its approach to fake news and what it called the *false equivalence* between accurate and inaccurate information.

The new structure of regulation meant all British broadcasting was under the same regulator, though with very different obligations, reflecting the fact that the commercial and publicly funded parts of British broadcasting were parting ways at the start of the 21st century. The BBC was to continue to be tightly regulated, as an organization paid for by the public through the television license fee. The commercial sector could look forward to lighter regulation. However, public and political support for high-quality, impartial broadcast news, guaranteed by external regulation, remained as perhaps the last enduring journalistic

legacy of the British experience with public service broadcasting.

BRITISH COMMERCIAL NEWS BROADCASTING

Since 1955, British commercial broadcast journalism services have provided an alternative to and competition for the publicly funded British Broadcasting Corporation (BBC). For 60 years, that competition has resulted in high levels of investment in broadcast journalism, both news and current affairs, and high standards of editorial and production quality together with a commitment, in the main, to a quality editorial agenda. Journalism on commercial networks has been supported by a regulatory regime that rewarded investment in high-quality news and current affairs and insisted on impartiality and accuracy as the key journalistic values. For most of the period, commercial broadcast journalism enjoyed a reputation for enterprising and investigative reporting and was seen to match the BBC for quality. At the end of the 20th century, however, growing competition for audiences and the progressive deregulation of British television led to a decline in the significance of broadcast journalism in commercial television. By the early 21st century, one of the major issues as Britain switched to digital television was how much of that journalist heritage would survive. However, British commercial news broadcasting has so far proved the pessimists wrong and, as of 2021, remains an important source of impartial and accurate journalism. This entry examines network news on the Independent Television Authority (ITA) and discusses the *News at Ten*, *Channel 4 News*, and *Five News* broadcasts, as well as current affairs and regional news. The entry also presents a brief overview of British cable and satellite news and radio news. Finally, the entry looks at effects of the deregulation of the British television market and the arrival of digital television, the direction of British commercial public service broadcasting in the digital age, and major changes in the sector of British commercial broadcast journalism.

Network News on Independent Television

When commercial television was launched in the United Kingdom in 1955, it was as a network of regional companies. None of them had the resources or expertise to produce national and international news. Despite that, the then regulator, the ITA, insisted that the Independent Television (ITV) companies provide high-quality national and international news as part of their license obligations. With the regulator's encouragement, they set up a separate company, Independent Television News (ITN), to provide the network news service. It soon established itself as an enterprising and innovative operation. Geoffrey Cox, ITN's editor from 1956 to 1968, was one of the creators of modern television news in the United Kingdom. Where the BBC had used presenters to read the news, he hired experienced journalists to write as well as read news stories. ITN soon also employed the first woman newscaster (Barbara Mandell) in British television.

Cox introduced interviews into news programs, making headlines with a controversial interview by his star interviewer, Robin Day (later the BBC's main current affairs interviewer), with President Gamal Abdel Nasser of Egypt in 1957, a few months after British forces had temporarily seized the Suez Canal. ITN's news coverage was equally enterprising and daring. When the Soviet Union crushed an uprising in Hungary in 1956, ITN's cameraman shot the classic pictures of the column of Soviet T34 tanks heading for Budapest. During the 1960s, ITN developed the technique of the "reporter package"—cutting pictures to match the correspondent's commentary—which had been pioneered by CBS and other American broadcasters. Cox was convinced that television news should be accurate and impartial and have the same high ethical standards as the BBC. He helped ensure that the culture of impartiality was deeply embedded in British broadcast journalism.

News at Ten

Cox's most important innovation came at the end of his editorship. In 1967, he persuaded the regulator and the skeptical ITV companies to experiment with a 30-minute news program in prime

time—at 10 p.m. on weeknights. The broadcast was called *News at Ten* and it immediately established itself as one of the most important programs on the network, with audiences regularly in the top 20 or even top 10 ITV programs of the week. In 1968, it was the most popular show on British television on three occasions, and for 30 years, it remained a fixed point in the ITV schedule. Its newscasters from Alastair Burnet to Trevor McDonald—the first Black journalist to be a British television network's principal newscaster—became household names. Its style of presentation owed something to American network news at the time with a combination of serious, frontline reporting and stories with a popular touch—the program often ending with a lighter, human interest item introduced with the words “and finally . . .”

Starting in the 1970s, ITN offered three main newscasts each weekday—at lunchtime, in the early evening, and *News at Ten*. The company had a reputation for technical innovation—making effective use of lightweight electronic newsgathering cameras, video editing, computer graphics, and satellite newsgathering. ITN usually matched and sometimes beat the BBC in its coverage of major events—elections, space shots, the fall of European communism, and the 1990–1991 Gulf War. However, its owners did not allow it to diversify into current affairs or regional news, and it entered the 1990s too dependent on its contract with ITV and on the reputation and prestige of *News at Ten*.

Channel 4 News

When Channel 4 was launched in 1982, its remit was to provide a commercially funded alternative to both the BBC and ITV. Nowhere was that more evident than in its news service. Channel 4 was a publisher/broadcaster—it did not make its own programs but commissioned them from independent producers. It commissioned its news from ITN, but with the brief to be very different from the ITV service. Where ITV was appealing to the mass audience, *Channel 4 News*, at 7:00 p.m. each weeknight, was unashamedly highbrow—combining news and current affairs in an hour-long program with specialist reporting, in-depth analysis, and studio interviews.

After a disastrous start with zero ratings, *Channel 4 News* was turned around by its second editor, Stewart Purvis, who soon made it one of the channel's most respected programs and a key part of its assignment from the regulator. Like *News at Ten*, it became a fixed point in its channel's schedule and its investigative, in-depth approach to journalism won it numerous industry awards. In 1992, a joint *Channel 4 News/News at Ten* team discovered the Bosnian Serb detention camps at Trnopolje and Omarska. The pictures of emaciated Bosnian Muslim prisoners, which were rapidly distributed around the world, caused an international outcry.

Five News

The last over-the-air television network, free to air to audiences with an antenna, to launch in Britain was *Five News*. It had a much smaller budget than ITV and Channel 4, but the company that had won the license had promised the regulator a high-quality news service with a distinctive approach to news, aimed at a younger audience than its competitors. *Five News* initially commissioned ITN to produce the program, presented by Kirsty Young, the first woman to be chosen as principal presenter of any British network's news service. While her (predominantly male) rivals sat behind desks in conventional news studios, she perched on a desk in the middle of the newsroom.

The program launched in the middle of the British general election in 1997 and rapidly established itself as one of *Five News*'s most distinctive and admired offerings, with an appeal to younger viewers who were turning away from more conventional newscasts. A number of its innovative approaches to news production—video diaries and deconstructing the reporter package—were copied by other programs.

Current Affairs

From the early days of ITV, the regional companies were obliged by the regulator to produce and broadcast serious current affairs programming in prime time. Over the first 40 years of its history, ITV produced an impressive amount of analytical

and investigative journalism—notably two flagship programs in prime time.

The first, *This Week*, began in 1956. It was produced by the company that held the London weekday franchise, initially Associated Rediffusion and then its successor, Thames Television. It specialized in controversy and investigations—bringing it into conflict with the British government, particularly over tensions within Northern Ireland. In 1977, a program criticizing the treatment of Irish terrorist suspects was pulled from the schedules by the regulator under government pressure. In 1988, a program titled *Death on the Rock* challenged the official version of the circumstances in which three members of an Irish Republican Army (IRA) unit had been killed by British security forces in Gibraltar. There was speculation that *Death on the Rock* was a factor in the government of Margaret Thatcher deciding to have a blind auction for ITV licenses in 1991, as a result of which Thames lost its license and stopped broadcasting in 1992.

From 1963, *This Week* was joined by *World in Action*, produced by Granada, which held the franchise for the northwest of England. *World in Action* also produced a string of hard-hitting programs. It investigated miscarriages of justice such as the Birmingham Six—a group of men wrongly convicted of an IRA Birmingham pub bombing in 1974 who were eventually released in 1991.

ITV also produced more populist current affairs, particularly consumer investigations such as *The Cook Report*, which usually ended with a dramatic confrontation between the reporter and the alleged villains. And an impressive roster of current affairs programming was completed by the more cerebral *Weekend World*, produced by London Weekend for a Sunday lunchtime slot, which from 1972 to 1988 offered an hour's analysis of an issue of the week, including an extended interview with a key figure in the news (usually a politician), rather like the American networks' Sunday morning programs.

Channel 4 was also under a regulatory obligation to carry serious current affairs in prime time. After a number of experiments, it found a format that worked—*Dispatches*. This was a 45-minute program that looked in depth at a single subject each week. Each edition was produced by a different independent production company. It focused

on investigative journalism and international stories and won numerous industry awards for its analytical reporting.

Regional News

ITV had begun as a network of regional companies, so the regulator required them as a condition of their licenses to produce high-quality regional news and current affairs programming. For many of the smaller companies in the network, these local programs were the most important output they produced and a key factor in retaining their lucrative licenses when they came up for review. ITV was the most important broadcaster of regional news in the United Kingdom. Its programs were better resourced and had larger audiences than their BBC counterparts. Their newscasters were important personalities in their local communities. Many, if not all, of the senior executives in the ITV system began their careers in local newsrooms.

The regional companies also fed pictures and stories to ITN for incorporation in the network news, but resisted any attempts to merge the different operations. Their programs carried the names of their companies—*Granada Reports* and *Thames News*—rather than any reference to the ITV network as a whole. The regions they served were determined by the location of the regional transmitter network, so the companies began to split some of their regions into subregions. At the system's peak, ITV was running 17 different early evening news programs to its regions and subregions. At the end of the century, the British government established a Scottish Parliament and similar assemblies in Northern Ireland and Wales, with new powers to run major parts of domestic policy such as health and education. This led to a wave of investment in broadcast journalism (facilities and programs) in Scotland, Wales, and Northern Ireland to match the transfer of responsibilities from the Westminster Parliament to the new bodies.

Cable and Satellite News

In 1989, Rupert Murdoch launched Sky News as Britain's first 24-hour news channel. Although produced at a loss and with small audiences

compared with the terrestrial newscasts, it brought credibility to the emerging satellite and cable sector. Its fast-moving, popular style of journalism gradually won it greater respect and it established itself as a channel with a reputation for frontline reporting and innovative techniques.

Until 1997, when the BBC launched its news channel, Sky's only competition was from international news channels such as CNN International. Sky was able to position itself as the first place for viewers to go for breaking news. It benefited from consistent and heavy investment by the Murdoch empire. By the turn of the century, BSkyB, a satellite operation, was spending more on its news service than terrestrial ITV, and Sky News was beginning to compete head-to-head with the BBC and ITN for industry awards.

Throughout the 1990s, Sky News tried hard to persuade the terrestrial broadcasters to move their news contracts from ITN to Sky when they came up for renewal. The competition helped the terrestrial broadcasters force down the price of their news from ITN at a time when they were trying to cut costs. ITV and Channel 4 stayed with ITN. But in 2005, *Five News* moved the contract for its news service to Sky, giving Sky News a significant foothold in public service broadcasting. However, the contract moved back to ITN in 2012.

In 2000, ITN entered the news channel market with its own 24-hour channel, ITN News. After 2 years of losses, ITV bought the channel and renamed it *ITV News*. But it continued to lose money, falling third in the ratings behind Sky and the BBC. ITV closed it in 2005.

Radio News

When British commercial radio was launched in 1973, it was as a growing group of local stations, which were required by their licenses to provide local, national, and international news. They decided to provide their own local news services, but to take their network news from a new company, Independent Radio News (IRN), which was run by the main London radio station, the London Broadcasting Company (LBC).

IRN and LBC were pioneers of new approaches to radio journalism with much greater use of location reporting and introducing program

techniques such as the phone-in during which correspondents and presenters could discuss the news with listeners. They borrowed formats from North America and Australia, and many of their editorial staff were Australian and New Zealand journalists. IRN became a training ground for many reporters and producers who went on to great success in commercial television. But British commercial radio lacked network service, and there was never a 24-hour news and information station to support further expansion of the news service beyond mostly short newscasts aired on music stations.

In 1991, after LBC ran into financial problems, the IRN service was contracted out to ITN. This was one of the first “bi-media”—combined radio and television—operations in British journalism, with ITN television staff providing material for radio bulletins. As BBC Radio expanded its news and current affairs output, the gap between publicly funded and commercially funded journalism in radio was much more pronounced than in television.

The System in Decline

The range and quality of commercial broadcast journalism had been protected by spectrum scarcity that had limited competition and by a regulatory system that actively encouraged and rewarded investment in and commitment to high-quality journalism. The deregulation of the British television market in the 1990s and the arrival of digital television undermined the business model that had supported commercial broadcast journalism as a match, on television at least, for the journalism produced by the publicly funded BBC.

The first sector to show the strain was ITV current affairs programming. A senior executive of one of the new ITV companies that won the blind auction in 1991 said that it was not the job of ITV programs to get innocent people out of jail. In an environment in which entertainment and ratings were the priorities, the network’s serious current affairs programming began to decline. In 1992, after Thames Television lost its license, *This Week* disappeared from ITV schedules, to be replaced by less successful and less demanding programs such as *The Big Story*. Six years later, *World in Action* was replaced by a more populist program, *Tonight*,

with a similar agenda and approach to U.S. news magazines of the period such as *Dateline NBC*. The new regulator, the Independent Television Commission (ITC), allowed ITV to cut the number of network current affairs programs and cut back radically on regional current affairs and factual programming.

Equally dramatic changes took place in network news. From 1992 to 2001, ITV halved ITN’s budget for national and international news in real terms. In 1998, it shut down its most important journalistic brand, *News at Ten*. This proved to be a disastrous decision. When the regulator, alarmed at collapsing news audiences, tried to get ITV to reinstate it a year later, the result was an unsatisfactory compromise where the program started sometimes at 10 p.m. and sometimes at 10:30, leading it to be branded “News at When.” ITV then got the regulator to agree to move its news to 10:30 p.m. again in 2002, only for *News at Ten* to be revived by new ITV management in 2008. But by that time, the BBC had moved its flagship news to 10 p.m., and ITV found it very difficult to get viewers back to a program it had abandoned.

The picture in regional news was equally grim. ITV changed its early evening schedule and began to cut back on regional news budgets. By the end of the century, the BBC had for the first time overtaken the early evening ITV regional news audience in every region of the United Kingdom. ITV executives warned that their commitment to regional news could not be guaranteed after digital switchover, where all viewers would have access to multichannel television and ITV no longer enjoyed the advantages of being one of the five terrestrial networks.

Uncertain Future

The beginning of the 21st century saw government, industry, and regulators engage in a complex debate and negotiation about the future of British commercial public service broadcasting. Many of those discussions centered on how much of commercial television’s journalistic heritage could be preserved for the digital age.

Analysis by the Office of Communication (Ofcom), the ITC’s successor in 2004 as commercial broadcasting’s regulator, suggested that

network news of high quality on ITV, Channel 4, and *Five News* would probably survive digital switchover and there would still be room in the schedules for some current affairs. But Ofcom was much more pessimistic about the regional news services on ITV—which might have needed to cut back the network to a smaller group of big regions and even in that case might have required some form of public subsidy to survive.

There was also the beginning of a debate about whether the obligations of impartiality should still apply to commercially funded news and current affairs, with some politicians, regulators, and broadcasters arguing that in a world of digital media, plurality of opinion and approach to news was more important than adherence to the strict rules of impartiality at least as far as commercial broadcasting was concerned.

New Approaches and New Owners

However, over the first two decades of the 21st century, news has survived on UK commercial television far better than the most pessimistic forecasts. British audiences had always expected high-quality news as part of their main commercial channels, and the broadcasters realized news helped differentiate their brands from the growing competition of multichannel television and video on demand. Digital technology helped reduced costs. ITV, after the dramas of the past, continued to run a flagship *News at Ten* and reorganized its regional news service to provide the BBC with effective competition. ITV's current affairs and documentaries continued to make waves—in 2012 ITV's *Exposure* program broke one of the biggest stories in British broadcasting history—the revelation that one of the BBC's top entertainers, Jimmy Savile, had been a serial pedophile who abused hundreds of children on BBC premises. *Channel 4 News* remained the channel's most respected program, with exclusives such as the investigation into Cambridge Analytica.

The commitment to news has also survived changes of ownership with both Channel 5 and Sky being taken over by major U.S. media companies. When Channel 5 was bought by Viacom in 2014, its new owners stressed the importance of journalism by increasing its commitment to 5 News. In 2018, Comcast bought the Sky network after a bitter battle for control with Rupert

Murdoch's NewsCorp. As part of the takeover, it gave assurances that it would maintain the budget of Sky News at its current level for 10 years and announced an independent editorial board to safeguard the channel's journalism.

Despite the major changes in the sector, British commercial broadcast journalism remains more diverse, better resourced, and more committed to high standards than in many other Western democracies, where commercial pressures and deregulation have resulted in a more marked decline. And the strong program culture of British broadcast journalism—a commitment to impartiality and accuracy and to a less tabloid agenda than many mass circulation newspapers—ensures that in many ways those standards have been maintained into the digital age. The longer term challenge may come from the spectacular growth of social media as a source of news and the switch to on-demand viewing, especially among younger audiences.

BRITISH NEWSPAPERS

Newspapers play a significant role in British social life. They are, generally, highly regarded by the readers in providing important social, cultural, financial, and political perspectives. As a result, newspapers play a critical role in ensuring the functioning of British democracy. The national, regional, and local newspapers in the United Kingdom continue to be influential in shaping the public debate by reaching the vast majority of the people. On an average weekday, 5.7 million national newspapers were sold in the United Kingdom in December 2017; between October 2016 and September 2017, national dailies reached on average 11.3 million adults, 21.5% of the United Kingdom under 21 years old. In this context, British newspapers effectively provide a plurality of views on current issues and reporting on matters that are deemed to be in the public interest.

As of December 2019, there are 10 “national” daily newspapers and Sunday-only weekly newspapers circulated in England and Wales. National daily newspapers publish every day except Sundays and Christmas Day.

Scotland, however, has a distinct tradition of newspaper readership. In addition to Scottish editions of national newspapers, Scotland has its own quality and tabloid newspapers. As of November 2019, there are four national daily newspaper in Scotland: *Daily Record*, *The Scotsman*, *The Herald*, and *The National*. Sunday newspapers include the *Sunday Mail*, the *Sunday Herald*, and *Scotland on Sunday*.

General Characteristics

British newspapers are among the oldest, readily recognized, and highly respected in the world. *The Times* was established in 1785, *The Observer* began publishing in 1791, and *The Guardian*

published its first print in 1821. The *Daily Telegraph* was established in 1855 and *Daily Mail* was founded in 1896.

The modern newspaper industry in the United Kingdom remains a significant force in the political, social, and economic life of the nation. From the temperate analysis of the *Financial Times* and *The Guardian* to the tub-thumping of the tabloid press, the British public has access to a healthy mixture of domestic, foreign, and investigative reporting.

One of most important characteristics of the British newspaper industry is that, in both sales and reputation, the national papers published in London dominate. London’s Fleet Street was once considered the most important location for journalism in the world, with Britain’s national newspaper making the street its home for centuries. Although most newspapers have moved away from the location, Fleet Street remains the embodiment of the British newspaper industry. The Fleet Street demise began in 1986 when Rupert Murdoch moved publication of his newspapers—*The Times*, *News of the World*, and *The Sun*—to new premises in East End of London. However, Fleet Street’s legacy lives on, as a byword for the United Kingdom’s national newspapers.

The next prominent characteristics of the British newspapers relate to “classification” of the papers. British newspapers can generally be split into three distinct categories: the broadsheets, the tabloids, and the free press.

Broadsheets

The first category relates to the more serious and highbrow newspapers; they are usually referred to as the *broadsheets*. This category of newspapers is also known collectively as the *quality press*. The titles normally associated with this category are *The Times*, *The Guardian*, *Daily Telegraph*, *The Sunday Times*, *The Telegraph on Sunday*, and *The Observer*.

The Guardian, for example, is one of Britain’s more trustworthy newspapers and is the newspaper most associated with liberal middle-class and university-educated readers. At the core of the paper’s organizational ethos lies concern over the environment and sustainability as well as trepidations about social, economic, and political

inequality. *The Guardian's* investigative journalism is some of the best in the industry, and the newspaper won the Pulitzer Prize for public-service reporting in 2014. Winning a Pulitzer Prize is the highest accolade in U.S. Journalism and is recognized globally.

While *The Guardian* represents the social democratic elements of British politics, *The Daily Telegraph* is more aligned with Conservative politics. Through the 1970s and 1980s, *The Daily Telegraph* remained relatively free of labor disputes and maintained financial stability under its group ownership headed by Lord Hartwell. In 1985, Canadian financier Conrad Black bought a majority interest in *The Telegraph*. Questions about Black's management of the newspaper, combined with financial scandals, forced change of ownership. In July 2004, the paper was acquired by twin brothers Sir David and Sir Fredrick Barclay who also owned *The Scotsman*.

Unlike *The Daily Telegraph*, *The Independent* and *The Times* have changed in recent years to a compact format, the same size as the tabloids. *The Guardian* moved in September 2005 to what is described as a "Berliner" format, slightly larger than a compact. Its Sunday stablemate *The Observer* followed suit. Both *The Guardian* and *The Observer* now use the tabloid format, having done so since January 2018. Despite these format changes, these newspapers are all still considered broadsheets.

Other Sunday broadsheets, including *The Sunday Times*, which tend to have a large amount of supplementary sections, have kept their larger sized format. The national Sunday titles usually have a different layout and style from their weekly sister papers and are produced by separate journalistic and editorial staff.

Tabloids

The second category is assigned to what is generally known as the *tabloids* and is collectively referred to as the *popular press*. The British tabloid newspapers mostly tend to focus on celebrity news and human interest stories rather than political or reporting the news from abroad. The tabloids in turn have been divided into the more sensationalist mass market titles, or "red tops," such as *The Sun*, the *Daily Mirror*, and the *Daily*

Star and the middle-market papers such as the *Daily Express* and the *Daily Mail*.

In the tabloids category, *The Sun* occupies a special place in the industry. The paper was for a long period Britain's most-read newspaper and is currently owned by Rupert Murdoch's News UK, the same group that also owns *The Times*. *The Sun* dominated the circulation market for daily newspapers from the late 1970s to the late 1990s. However, as of September 2019, *The Sun* has an average daily circulation of 1.2 million and, therefore, has lost its claim to be the most read newspaper in Britain. *The Sun* has been involved in numerous controversies in its history, including the trial of six of its senior editors and journalists for misconduct in a public office in 2014.

Free Press

The third category is the free newspapers and is now collectively known as the *new business model* in British newspaper industry. The most notable free papers in the United Kingdom are *Metro*, *Evening Standard*, and *City A.M.* These newspapers collectively reach around 2 million commuters across the United Kingdom. According to figures published in 2019, *Metro* now has the largest circulation of any British newspaper, with 1.5 million copies handed out every weekday.

Metro, which is available in multiple cities across the United Kingdom, is a morning "commuters" newspaper. The free newspaper is distributed from Monday to Friday mornings on trains and buses, and at railway and underground stations, airports, and hospitals across selected urban areas of England, Wales, and Scotland. *Metro* follows a very similar journalistic style to other British tabloids. Most of the stories are rather brief and the main focus is on entertainment, sports, and celebrity news. However, unlike tabloids, there are no editorial or opinion columns in *Metro* and news is presented without a political pitch.

Metro was launched by Daily Mail and General Trust, the owner of the *Daily Mail* in 1999. For much of its life, it was seen to be too insignificant by most media commentators. But *Metro* is turning a growing profit and is now the most-read in the country.

While *Metro* has succeeded in reaching high circulation figures in 2019, the paid-for

newspapers are under increasing pressure to compete in paid-for market. One reason for the decline of the paid-for press relates to a particular episode in British newspaper history that is now regarded as the defining moment in the industry, that is, the scandal that engulfed a popular Sunday newspaper, the *News of the World*.

***News of the World:* A Special Case in the History of the British Newspaper Industry**

The *News of the World* is a particularly interesting case in the long history of the British newspaper industry. The paper was a weekly national newspaper published every Sunday from 1843 to 2011. It was at one time the world's highest selling English-language newspaper, and at the time of closure still had one of the highest circulations in the country. The paper was originally established as a quality broadsheet by John Browne Bell in 1843 and was generally regarded as a respected Sunday paper. Rupert Murdoch's News Limited acquired the paper in 1969 and initially retained its broadsheet format until 1984 when it was launched as a red-top tabloid for the first time. *News of the World* later became the Sunday sister publication of *The Sun*.

In many ways, *News of the World* had all the traits of a paper passionately committed to issues related to public interest. It cleverly addressed the readers directly by giving space to their opinions. This was a hugely successful commercial, enabling *News of the World* to claim 2.6 million regular sales every Sunday.

From 2006, however, the paper was increasingly entangled in allegations of phone hacking. The allegations were initially related to the revelation that the paper had hired a private investigator to intercept the voicemails of a missing teenager, Milly Dowler, who was later found murdered. In 2011, it eventually became clear that the paper had hacked into the phones of many people who were deemed as "subjects of interest" or seen as "news worthy." They included the families of British military personnel killed in action, celebrities, and high-profile politicians. As further allegations against the paper were made public, a number of senior editors of *News of the World* were arrested, convicted, and jailed for phone hacking.

News International announced on 7 July 2011 that, after 168 years in print, *News of the World* would print its final edition on 10 July 2011 with the loss of 200 jobs. In the paper's final editorial, the paper admitted that "phones were hacked, and for that this newspaper is truly sorry . . . there is no justification for this appalling wrongdoing." The final edition of *News of the World* sold 3.8 million copies, about 1 million more than usual.

The *News of the World*'s absence from the Sunday market represents an unprecedented episode in the history of the British newspaper industry. The phone hacking by the paper's journalists led to the closure of a historically significant media establishment and had formed the basis of a parliamentary inquiry and the launch of three police investigations. Furthermore, the phone hacking episode led the Conservative government to instruct Lord Justice Leveson to conduct a two-part inquiry to assess the culture, practices, and ethics of the British press and its relationships with the police, the public, and the politicians. The Leveson report concluded that there was recklessness in the way *News of the World* had prioritized sensational stories irrespective of the harm the stories could cause the rights of those who would be affected. The Leveson report has since become synonymous with the way regulatory bodies failed to prevent the journalists working for *News of the World* to act unlawfully, and unethically, by using their profession to intrude into private citizens' lives.

Recent Structural Transformations in the National Newspaper Industry

The *News of the World*'s demise and *Metro*'s recent success underline a much deeper institutional and structural transformation in the British newspaper industry. During the first two decades of the 21st century, British newspapers, and the provision of news as a whole, has gone through considerable changes. Fueled by shifts in reader behavior and preferences, and by technological innovation, particularly among younger age groups, readers are now able to access news via multiple means from a wide variety of sources and often at no cost. Increasingly, news is also mediated by social and search platforms, which,

despite the availability of tools and practices to help publisher's monetize their content on their platforms, do not necessarily compensate the original producers of much of the news journalism surfaced online.

Overall, national newspaper readership has dropped by one fifth since the 1990s, according to the National Readership Survey. Circulation of national newspaper titles has decreased from almost 30 million in 2003 to 12.4 million in 2017. National Sunday titles have gone from 13.9 to 5.4 million and national daily titles from 13.3 to 7 million.

The most significant implication of this trend has been in the way advertisers have shifted to other media to get their messages across. According to *Press Gazette*, the national newspapers' share of advertising spending has decreased from 21% in 1985 to 10% in 2018.

Another major impact of the falling readership trend is related to young people's consumption of news brands. The young are just not buying newspapers the way their parents did. The number of newspaper readers under the age of 24 had shrunk by a considerable size since the 1990s. According to Ofcom, only 21% of 16- to 24-year-olds are prepared to buy newspapers in 2018. When young Britons do read newspapers, they tend to like the ones without much news. Richard Desmond, the former owner of Express Newspapers and publisher of titles ranging from *Women on Top* to the *Daily Star*, managed to reinvent this end of the market by relying heavily on celebrity news, often jointly with *OK!*, a specialist weekly magazine published by the same group.

All the major British newspapers currently have websites, some of which provide free access. *The Times* and *The Sunday Times* have a pay-wall requiring payment on a per-day or per-month basis by nonsubscribers. The *Financial Times* business daily also has limited access for nonsubscribers. *The Independent* became available online only upon its last printed edition on 26 March 2016. However, unlike the previously mentioned newspapers, it does not require any payment to access its news content. Instead, the newspaper offers extras for those wishing to sign up to a payment subscription, such as crosswords, puzzles, weekend supplements, and the ability to

automatically download each daily edition to read offline.

Regional Newspapers

Most towns and cities in the United Kingdom have at least one local newspaper, such as the *Evening Post* in Bristol and *The Echo* in Cardiff. They are not known nationally for their journalism in the way that some city-based newspapers in the United States are (e.g., *The New York Times*, *The Washington Post*, and *The Boston Globe*). An exception to this was *The Manchester Guardian*, which dropped the "Manchester" from its name in 1959 and relocated its main operations to London in 1964. The Guardian Media Group produced a Mancunian paper, *The Manchester Evening News*, until 2010 when along with its other local newspapers in the Greater Manchester area it was sold to Trinity Mirror.

As of July 2017, the Audit Bureau of Circulation reported a total of 982 local and regional newspapers being printed in the United Kingdom. However, according to a document published by the UK Government's Department of Culture, Media and Sport in 2018, there are a further 61 titles, bringing the total to 1,043.

Research carried out by the Mediatique in 2018 indicates that the local and regional press is characterized by a relatively high level of market concentration. In July 2017, the top 20 newspaper groups collectively published 76% (792) of all the local and regional titles in the United Kingdom and accounted for 97% of the total weekly circulation, with the top six groups alone accounting for 81% of the weekly circulation of local and regional newspapers in the United Kingdom. As of December 2019, the top six newspaper groups dominating the circulation of regional newspaper are respectively: *Trinity Mirror*, *London Evening Standard*, *News Quest*, *Associated Newspapers*, *Johnston Press*, and *Archant*.

On the 1,043 local and regional newspapers identified by the Mediatique, about 77% (737) are published weekly or even less frequently. A total of 605 (58%) local and regional newspapers charge a cover price, with 438 (42%) being free of charge.

In addition to publishing printed material, most local and regional publishers in the United

Kingdom have dedicated websites; however, in recent years, publishers have launched local digital-only news brands. As of January 2020, there are eight such websites operating in areas such as Oldham.

The regional newspapers have benefited from digitalization of their products. However, new opportunities arising from digital technologies have not compensated for the losses suffered in print revenues. Circulation declines have had two impacts—a drop in unit sales that cover price increases have not fully offset and a decline in advertising revenues reflecting lower readership.

Partisan Press

The British newspaper market dynamics are increasingly pushing paid-for papers in a more partisan direction. While circulation of newspapers has declined considerably, this has not diminished national newspapers' influence on British politics.

Generally, national newspapers are not formally tied to specific political parties. However, most papers display clear political alignments that are usually determined by their owners. The *Daily Mail* and *The Daily Telegraph* have consistently supported the Conservative Party, whereas *The Daily Mirror* and *The Guardian* have normally supported the Labour Party. *The Sun*—one of the most popular newspapers in the United Kingdom—supported Labour in the early 1970s, switched to the Conservative Party under Margaret Thatcher in 1979, and switched back again to Labour in the late 1990s only to return to the Conservatives by the early 21st century.

These political alignments by the national newspapers are particularly evident during, and after, the referendum on Britain's European Union (EU) membership in 2016. The referendum on Britain's EU membership (Brexit) highlighted two very important issues: It had become the biggest political event in Britain in recent memory and that news media, particularly newspapers, responded proactively with their extensive coverage, editorials, and in-depth discussion of various issues related to benefits or disadvantages of Britain's membership. National newspapers'

involvement was hugely influential in providing the people with relevant information; however, various studies have shown that the newspaper coverage of the campaign was biased toward "Leave."

Moreover, it was found that those who voted for "Remain" were more likely than before to expect their favorite newspaper to reflect their political views.

The Reuters Institute for the Study of Journalism at the University of Oxford, for example, showed that newspaper coverage of the referendum campaign was biased toward Brexit. After analyzing 2,378 articles, the Reuters Institute report reveals that of media pieces focused on the referendum, 41% were pro-Leave while 27% had a pro-Remain frame. This trend is further exacerbated when factoring in the reach of different outlets, with 48% of all articles showing a pro-Leave leaning and 22% pro-Remain line.

The British newspapers have long been seen as "experts" in "setting the agenda" for all other forms of media to follow. In the general election held on 12 December 2019, most national newspapers supported the Conservative Party and Boris Johnson's election mantra, "get Brexit done." The *Sunday Express*, for example, proclaimed "Vote Tory If You Really Want Brexit Done." Media researchers at Loughborough University examined the extent to which different newspapers ran positive or negative reports about different political parties in the first week of the 2019 general election campaign. They found that the Labour Party was overwhelmingly targeted with negative coverage by the national newspapers, while in certain papers, positive stories were almost exclusively reserved for Johnson's Conservative Party. The study also showed that the most positive coverage of the Conservative Party came from the highest circulation newspapers, with journalists at *The Sun* and the *Daily Mail* relied upon to publish deferential and pro-government reports. There is debate as to what extent newspaper coverage influences public opinion. One study carried out at the London School of Economics found that a boycott of *The Sun* on Merseyside (Liverpool, England) in the wake of a local incident appears to have led to lower levels of Euroskepticism in the region.

Migration to Online Platforms

The British newspapers industry remains highly influential in the social, political, and economic life of the nation. The national newspapers remain rather effective at two levels. In the tabloid sector, *Daily Mail* and *The Sun* are vital forces in British social and political life. The popular tabloid newspapers have a reputation for exposing corruption and wrongdoings at all levels of society. This point was discussed in relation to *The News of the World*.

The British national newspapers can also compete at a global level. According to Omniture (an online marketing and web analytics firm based in Utah in the United States) MailOnline is one of the world's largest English-language newspaper websites with more than 24.9 million monthly unique visitors, each spending an average of 49 minutes on the site per month. Furthermore, according to the Department for Digital, Culture, Media and Sport survey, MailOnline has retained its position as one of the most visited newspaper websites in the United Kingdom.

In the broadsheet category, Britain is home to a cluster of globally reputable newspapers such as the *Financial Times* and *The Economist*. According to the *Financial Times* website, digital subscriptions now account for more than three quarters of the newspaper's circulation and 70% of its readers are outside the United Kingdom, illustrating the publication's global reach. Similarly, *The Economist* claims on its website that its current circulation is over 1.4 million, more than four fifths of it outside Britain. The American circulation accounts for over half of the total.

However, the national newspaper industry in Britain has been under sustained pressure for more than 20 years. The constant shift in readers' preferences and a greater migration to online platforms has had a detrimental impact on advertising revenue. Recent developments have transformed the traditional consumption of content via print products, forcing the industry to increasingly prepare for further migration of readers to online formats. Fundamentally, these changes have severely impaired news brands' traditional revenue streams which include circulation, print display advertising, and classifieds.

BROADCAST, OR BROADCASTING

Within the very broad context of the development of American journalism, the beginnings of broadcast news have often been regarded as a by-product of technical innovation in the field of radio. The early experimentation in radio tended to concentrate on relaying entertainment content including singers and musicians with an effort to demonstrate the medium's commercial potential to attract sponsorship. By way of comparison, one often hears that the early newspaper press developed and then expanded in America because of the need to exchange and propagate important ideas, often related to party politics, economics, or some important social movements or agendas. This entry discusses the development of radio broadcasting and the beginnings of broadcast journalism, as well as broadcast journalists. The entry also examines television development and

the evening news. The entry closes with a discussion of the video era.

Radio broadcasting was part of the movement to advance technical development and innovation often taking place in isolation on a college campus or in someone's attic or basement, usually in a setting in which a lone inventor experimented and then made claim to advancing the medium's technical characteristics. For this reason, the preponderance of the attention regarding broadcasting's development has been given to the technical side of things with an emphasis on entertainment, while broadcast news advanced in more limited ways, mostly fits and starts, and usually related to a breaking news event. Once the medium advanced beyond the experimentation stage when radio sets were constructed at home, the development of individual radio stations including the first commercially licensed station, KDKA in Pittsburgh, Pennsylvania, others emerged, usually with commercial backing of big city business, often joining developing networks, with some of them leading a movement to advance the field of news by radio.

Among the many inventors in the field of broadcasting, worth noting are Guglielmo Marconi who demonstrated wireless telegraphy across the Atlantic Ocean, Lee DeForest who pioneered experimentation using an Audion tube in an experimental radiophone base in New York, and Nathan B. Stubblefield of Kentucky, who improved the status of wireless telegraphy and then broadcast to more than 1,000 people from his small, local community in Murray, Kentucky, in 1890. Stubblefield's demonstration of wireless telegraphy covered a number of miles and was reported widely because of a first-hand account of the exhibition appearing in the *St. Louis Post-Dispatch* and later republished and retold in other print news outlets. Stubblefield received a patent for his invention in 1908, and within a decade, he was already predicting use of radio for news transmission. His prediction notably predated David Sarnoff's early "Radio Music Box" memo of 1915, the prescient occasion in which the future RCA President explained how radio would be used. Sarnoff further predicted how the medium was likely to assume a special place in America for both entertainment potential and in sharing news and information.

Radio Development

Radio grew very rapidly once the various inventions related to the establishment of radio broadcasting were made—most of them by the 1920s. And then it became clear—very quickly, that the tremendous growth of the medium due to commercial potential meant that many of the pioneer radio stations would be interfering with each other. The establishment of the Federal Radio Commission, later the Federal Communications Commission, addressed the many issues regarding ownership of the airwaves as a public trust. The U.S. government, under Secretary of Commerce Herbert Hoover, also attempted to take some basic steps to address the on-air chaos. As radio developed as a major source of advertising revenue, newspapers which had initially been threatened by radio's potential to steal advertising from their established base began to invest instead in radio stations.

In some instances, the employees from newspapers worked jointly at an owned radio station. This movement towards cooperation included the first Pulitzer station St. Louis Post-Dispatch-owned KSD, as well as prominent Kansas City Star-owned WDAF. Also prominent in the Midwest, anointing itself as the “World's Greatest Newspaper,” the *Chicago Tribune* established a station with call letters emblematic of that lofty status, WGN. The station became well known for costly, daily coverage of the Scopes Monkey Trial addressing the issue of evolution from a courtroom in Tennessee in 1925. Another Chicago station focused almost exclusively on entertainment programming and had the sponsorship and heavy advertising by Sears in that same city. Established as WLS, the call letters for that station stood for “World's Largest Store.”

In some cases, variations in advertising policy which were strongly held and enforced by some of the major metropolitan newspapers addressed excessive commercialization and were adopted by their radio station peers. The *St. Louis Post-Dispatch*, for example, expunged excessive advertising and especially what it termed “middle commercials” from its radio programming, which addressed the interruption of war news or other reports about war fatalities with commercial announcements. This was done as a gesture of

respect for those fighting and dying in the war. The broadcast community debated whether such a policy was important, whether the issue was widely recognized, or if the policy even made sense given a lack of association with commercial products. Questions emerged about the relationship between on-air talent delivering product endorsements as they had done earlier with respect to the physical placement of newspaper ads within the context of news, by members of the print establishment. In some instances, stations were owned by major corporations with obvious vested interest, including American Telephone & Telegraph station, WEAf in New York, which owned needed telephone lines. From the beginning of the emergence of radio development, competitors questioned whether public policy issues could be fairly debated in a monopolistic environment with emerging broadcast attention.

Beginnings of Broadcast Journalism

The earliest broadcast journalists started in their profession with few professional requirements because the standards for broadcast programming which did develop grew alongside critical financial concerns. Some of the emerging, early radio voices tried their hand at the new medium and if discovering a calling, crossed over from the newspaper business. Many of the early broadcast network-affiliated radio stations, which also formed the basis for television broadcasting later on, began with close ties to corporate ownership and, in some cases, strong interests in other fields. This raised some critical questions about what the medium could and should be. With radio licenses held by commercial entities such as department and appliance stores, would the medium be used in those settings as a vehicle to promote commerce? And if the license owner was a major metropolitan newspaper, would the affiliated station focus more exclusively on news and information?

Once a number of these early questions were answered concerning how radio would develop and then financially sustain itself, in one of histories' great ironies, a good number of historic events demanded attention and thus prompted the sharing of information via radio. With the

coverage of a single major news story, for example, the historic sinking of the Titanic, one of radio's founding fathers, David Sarnoff, began to appreciate the importance radio was likely to play in the nation's future. Sarnoff used the knowledge and experience he gained from service as a young Marconi operator for the remainder of his career, as a corporate leader at RCA and NBC. And whenever international conflict appeared on the horizon, major political figures emerged to stress the importance of sharing information via radio news coverage as when later, Franklin D. Roosevelt used his "Fireside Chats" over the radio as a means of rallying the nation's confidence in helping him to restore a faltering economy from the Great Depression.

The Harding-Cox presidential election was covered by radio in 1920, and the 1924 election was included on the first national conventions reported over the radio. President Warren G. Harding addressed the nation about the topic of The World Court in 1923, and the Radio Act of 1927 addressed the emerging issue of political broadcasting. A large number of regional candidates used the medium very effectively to advance their early political prospects. Dr. John R. Brinkley, the controversial "Goat Gland Doctor" from Milford, Kansas, offered a bizarre medical cure over his Kansas station before running for governor of his state. Known as "The Kingfish," Huey Long used radio effectively to promote his "Share the Wealth" movement as both governor and then later as a powerful U.S. senator from Louisiana. A renowned radio preacher and commentator, Father Charles Coughlin of Royal Oak, Michigan also used radio to critique national economic policies, initially to support then later denounce the recovery program of Franklin D. Roosevelt. Father Coughlin was heard first over Columbia Broadcasting System (CBS) stations and then via a network he put together himself. He left CBS when the network started to question the appropriateness of someone with a religious affiliation arousing the public on economic and political matters over their airwaves.

Radio Journalists

Many of the informational innovations in radio took place with the emergence of William S. Paley's network, the CBS. It began as the Columbia Phonograph Broadcasting Company in 1921 and later CBS. By the 1930s, that company employed Paul White as its first radio news director as well as several noteworthy on-air radio commentators such as Lowell Thomas and H.V. Kaltenborn. Both were recognized for their expertise in providing perspective about the news of the day. And as the international scene heated up, another CBS Newsmen, Edward R. Murrow, emerged as radio's leading voice, along with others he recruited to CBS News, who became known as the Murrow Boys.

Murrow operated from a base in Great Britain and covered the build-up to World War II over his regular *This Is London* program. He worked in conjunction with the *CBS World News Roundup* in which correspondents reported live from the scene of international and sometimes breaking news, another innovation available through improvements in technology. He provided information for anxious listeners on the brink of war and then stayed to fly with the Royal Air Force on bombing raids over Germany. Interest in Great Britain and a growing appetite for what would later be termed "reality" programming reached a fever peak for radio in 1936 when King Edward VIII abdicated his throne for American divorcee Wallis Simpson, with the biggest worldwide audience up to that time.

It is often speculated that the sense of uneasiness leading America into World War II, and the nation's limited experience in terms of standards for radio news reporting, leads to an unusually big response for a single CBS program. Orson Welles' 1938 Halloween dramatization of H.G. Wells' *War of the Worlds*, over CBS' *Mercury Theatre of the Air* scared many people, especially in New York and New Jersey, where an invasion of men from Mars was supposedly taking place. That radio program used a common programming format of the day: dance band music, as a background to begin to convey the invasion of space aliens. It employed an unusual level of authenticity in terms of using what appeared to be

witnesses of the events, the use of experts, and “live” reports from the field including the identification of places and people approximating actual locations.

Orson Welles was heard playing the role of a Princeton Professor, and in the follow-ups to that broadcast, a bona-fide Princeton Professor, Hadley Cantril, conducted a formal study of the program’s impact for CBS. Cantril’s resulting book, *The Invasion from Mars*, demonstrated how and why this program had the major impact it did. Using extensive interviews with radio listeners, among his many conclusions was the fact that the radio medium had yet to establish standards for announcing important news. In the aftermath of the program, Orson Welles repeatedly claimed that he had no idea the radio play would create such a stir and cause a public reaction. Others claimed the program was calculated to show what could be done by radio without thorough disclaimers and clarification beyond what had been done in this instance.

Television Development and the Evening News

Unlike the case of radio, television experimentation and technical success were attributed to just two individuals: Vladimir Zworykin and Philo Farnsworth. Zworykin’s research and experimentation while working for Westinghouse and Farnsworth’s independent work as an inventor established their respective roles in advancing television’s technology. Farnsworth and his wife also became known for their success in fighting legal battles with David Sarnoff because Farnsworth had been wise enough to file patents documenting his work in the field. During the decade of the 1950s, television began to emerge as a solid visual alternative to what radio had been doing with respect to news coverage. And this occurred with the support of some of the already established, leading radio networks and successful informational programs such as *Meet the Press*, which NBC introduced over television in 1947.

The national evening broadcast of CBS-TV’s *Douglas Edwards and the News* began the following year, 1948. And then NBC News established an evening newscast with John Cameron Swayze

and his program, *Camel Caravan* the year after. By the 1950s, NBC had introduced Chet Huntley and David Brinkley on a newscast alternating between the two anchormen from their respective locations in Washington, DC and New York City. By that time, Edward R. Murrow had moved his *Hear It Now* CBS Radio program over to *See It Now* and CBS-TV. In the early 1950s, Murrow and his partner, Fred W. Friendly, were credited for a series of First Amendment programs and related issues, some of which focused specifically on Senator Joseph R. McCarthy and McCarthyism. Murrow’s March 9, 1954 program examined Senator McCarthy and his methods in attempting to expose Communists working in the U.S. government.

Many press critics praised the programs for standing up to McCarthy, but some others questioned the propriety of attacking an individual, especially a U.S. Senator, thereby setting a dangerous precedent. Live television coverage on what later became known as the *Army-McCarthy Hearings* doomed the Senator’s political fortunes. Edward R. Murrow gave a speech before the Radio-TV News Directors Association in which he questioned growing commercialism in TV. This hurt relations with others at CBS News, where he had figured so prominently.

Television played a major role in the presidential political contest of 1960 with one candidate, Senator John F. Kennedy, cooperating with a filmmaker to have a documentary account of his primary activity filmed in West Virginia and then along with opponent, Richard M. Nixon, participating in a series of so-called Great Debates which were televised live. Many sources credited Kennedy’s performance on TV as a major factor in aiding his victory as a viable candidate and also his later live press conferences over television, which helped him hone a popular image of being well informed and maintaining grace under pressure. Edward R. Murrow subsequently left CBS in favor of joining the Administration of John F. Kennedy.

Walter Cronkite emerged as the leading newsman for CBS and became well known nationally as the anchor of the *CBS Evening News*, having established a solid reputation as a wire service reporter and then network anchor and reporter. Cronkite’s coverage of the assassination and

funeral of U.S. President John F. Kennedy became a benchmark for his tenure as CBS News anchor, along with his coverage of the Space Race and Moon Mission. The Space Race was a story in which America was portrayed as competing with the former Soviet Union, a nation that had proved its commitment with Sputnik, the first satellite launched successfully from earth for advancement into space. The American effort was supported by NASA, and since Walter Cronkite had spent his early years near NASA in Houston, Texas, he had an understanding of the story and a natural interest in seeing that it was covered properly.

Cronkite had covered World War II as a wire service reporter and his later condemnation of America's involvement in the Vietnam War was widely discussed. Domestic television coverage of the Anti-War Protest Movement and Civil Rights Movement was enhanced by some related events, including rioting in some of America's big cities and large anti-war demonstrations in which some protesters and members of the press were attacked. The decade of the 1970s saw the news networks involved in a number of additional controversies, including especially network reporting from the 1968 Democratic Convention in Chicago, later referred to as a police riot. A series of long-form TV documentaries, aired over the networks, addressed lingering social and political issues. Among them was the CBS Reports' documentary, *The Selling of the Pentagon*, in which Roger Mudd presented a strong case in February, 1971, that the American military was spending large sums of money in an effort to promote military intervention and then consistently misrepresenting information related to the Vietnam War.

CBS President Frank Stanton had to defend the program before a congressional committee investigating the matter and faced a contempt citation if he would not produce excerpts or outtakes from the program, which he refused to do. Stanton narrowly escaped criminal prosecution and a charge of Contempt of Congress by a vote of 226–181, demonstrating the level of unhappiness with network news performance.

CBS joined with other elements of the national press in 1971 when the classified "Pentagon Papers" were published by *The New York Times*, and again later joining with the *The Washington Post* in coverage of Watergate. They reported on a

break-in and theft at the Democratic National Headquarters and a follow-up series explaining what had taken place. One of the unusual aspects of the early Nixon Administration activity was an orchestrated anti-press campaign by Vice President Spiro Agnew, aimed at leaders of TV network news, including network anchors. He regarded them as a nonelected fraternity of privileged men. In a series of speeches, Agnew claimed that the network leaders all came from the same liberal background and questioned their use of instant analysis, making the charge that there was bias when the three major networks provided immediate rebuke of all public pronouncements by President Nixon.

The Modern Video Era

In terms of television news development, the introduction of remote, "electronic newsgathering" equipment permitting broadcasters to go live from the scene of an event, changed the nature of TV news reporting. With the introduction of mobile broadcast equipment in 1974, live transmission using microwave technology and mobile equipment permitted live coverage of events. With this innovation, news directors had to consider how coverage from the scene of breaking news might impact the outcome or the trajectory of a story. They had to also consider the legal and ethical implications of going live to a sometimes yet unresolved event.

That same year, ABC News named the first woman, Ann Compton, as Chief White House Correspondent. And Compton was still serving in that role when the nation was attacked decades later, on September 11, 2001. She was invited to accompany President George W. Bush on Air Force One to make an assessment and account for the record what was taking place. Another woman, who covered the White House for CBS, Lesley Stahl, joined the staff of the leading news program, a magazine-style program for TV, the perennial ratings winner, *60 Minutes*.

In spite of inroads by women in broadcast news, a number of embarrassing and costly legal cases emerged in the first few decades of the new millennium, when it was revealed that some male broadcast managers, affiliated with the major

television news networks, namely CBS President Leslie Moonves and FOX TV executive Roger Ailes, had made improper advances towards women at their companies. These allegations against the two network executives included women who had been victimized at leading network news organizations working both behind and in front of the camera. Additional charges were brought against Matt Lauer, then of NBC, Bill O'Reilly, formerly of FOX, and Charlie Rose who had appeared simultaneously on programs over CBS and the Public Broadcasting Service.

The charges against these broadcasters and others became part of what became known as the *Me Too, Movement* with similar claims being against major figures in the entertainment industry, including some leading Hollywood producers, directors, and actors. Equally challenging in this regard were questions about coverage of news events in which so-called citizen journalists using small iPhones for instant coverage and transmission, placed material online, and some claimed to have been subjected to harassment by police. And some video shared over the Internet sometimes seemed to support their allegations.

BROADSHEET NEWSPAPERS

The term *broadsheet* refers to the size of the paper used for a newspaper. The large sheets of newsprint characteristic of the broadsheet format have traditionally dominated the daily newspaper industry. In the early days of newspapers, the large size of the page made it easier for printers to print a smaller number of larger pages. Because of cost and other considerations, over time, broadsheet newspapers have shrunk in size, and many newspapers have shifted to the smaller tabloid format. The term *broadsheet* also carries particular connotations of journalistic quality and seriousness in contrast to tabloids, which have come to be associated with a more entertainment-oriented, sensationalistic, and colloquial style. While “broadsheet” and “tabloid” continue to connote these different journalistic styles, in practice this divide began to disappear by the 1990s as the content of both types of newspaper began to overlap as more publishers shifted from the broadsheet to the less expensive tabloid format.

Origins

While newspapers developed during the print revolution that was made possible by the spread of the printing press, they slowly expanded in size to accommodate the medley of content crammed into publications by printers, including shipping news, foreign dispatches, commodity prices, and

advertisements. Similar to modern newspapers, these early-seventeenth-century broadsheets organized their text into vertical columns.

The broadsheet form developed largely out of technical necessity. In the 1600s and 1700s, newspapers continued to be printed on wooden presses requiring pages to be pressed against the type one sheet at a time. Printing was a slow, labor-intensive process. This constrained circulation to small numbers and made the single-sheet newspaper a necessity. As editorial and advertising content increased and the need for more space forced newspapers to expand, it made technical and economic sense to increase the size of the page rather than expand the total number of pages. A single page only needed to be folded; not assembled. One large sheet of newsprint could be printed on both sides and folded to create four separate pages.

In the early 1800s, the rise of mechanical presses increased printing speeds and allowed for greater print runs and thus circulations. Implementation of steam-powered presses further quickened the pace with which newspapers could be produced. But this did not lead to a diminishment of page size. Rather, it remained sensible, from the printer's standpoint, to churn out larger pages rather than assemble many smaller sheets. On the extreme end, broadsheet pages grew to enormous sizes due to advertising policies that encouraged yearly contracts, but did not restrict the size of the display ads. As a result, in the 1830s, a page of the *New York Journal of Commerce* measured a width of 35 inches and a height of 58 inches. When opened, the two pages spanned 70 inches, occupying a little over 28 square feet of space. Each page carried news and advertisements across 11 columns. This format came to be known as the "blanket" sheet because of its cumbersome size.

Large sheets remained standard for urban newspapers. In 1867, the *Chicago Tribune* carried ten columns, two more than the eight or nine column pages common in that era. Within columns, spaces between rows of text—known as leading—decreased. With a minimum of graphics, the pages came across as seas of gray type. Because of the large page dimensions, the total number of pages in nineteenth-century papers remained either four or eight, depending on the size of the circulation

and the size of the city. This meant only one or two actual pages were needed (before folding). In the twentieth century, the increase in use of graphics and movement away from text-heavy pages led to smaller page sizes and fewer columns—usually five or six. The total number of pages increased and newspapers began to be divided into sections.

Broadsheets and Tabloids

Challenges to the dominance of the broadsheet format began in the United States when some of the penny press newspapers began to run smaller pages. These mid-nineteenth-century newspapers were the original tabloid-sized papers and, in key ways, foreordained the popular journalism of the tabloid newspapers of the twentieth century. Two early twentieth-century examples of tabloid newspapers are the *Daily Mirror* in London and the *Daily News* in New York. The quick success of both newspapers raised interest in the format.

The rise of the tabloid format led to an important differentiation extending beyond simply page size. Tabloids came to be identified with a brash style of emotionally charged journalism. Tabloid pages teemed with short, punchy articles written in a distinct voice with abundant photographs. While broadsheets offered a range of stories on the front page representing the range of stories on any given day, tabloids featured one key story on the front, usually accompanied by a large, attention-grabbing headline.

With the rise of tabloids and their particular brand of populist journalism, broadsheets by comparison came to be identified as more sober with the reputation of seriousness. This was particularly the case in Britain with its nationally circulated newspapers. Tabloids and broadsheets competed across Britain, appealing to different demographics. Broadsheet readers were viewed as more educated and sophisticated whereas tabloid readers, many of whom were working class, were seen as the opposite. This difference was less pronounced in the United States because of the dominance of local market-specific newspapers. Tabloid newspapers competed directly with broadsheets in only the largest markets. Further melding the two approaches, starting in 1981, the national newspaper *USA Today*, while a broadsheet in its

dimensions, featured the colorful graphics and short stories characteristic of tabloids.

For a vivid example of the broadsheet-tabloid mix, consider New York City, by far the most competitive American newspaper market, though a shadow of what existed as recently as the 1960s. The two daily broadsheets, *The New York Times* and *The Wall Street Journal*, are considered paragons of in-depth news. By contrast, the *New York Post* and *New York Daily News*, both tabloids, are seen as sensational and succinct. For example, when the city's newspapers carried front-page stories about President Gerald Ford's refusal to grant federal funds to help the city avoid bankruptcy, the *Times* ran the headline: FORD, CASTIGATING CITY, ASSERTS HE'D VETO FUND GUARANTEE; OFFERS BANKRUPTCY BILL. By contrast, the *Daily News* ran the now-classic headline: FORD TO CITY: DROP DEAD. The complicated, policy-specific headline at the *Times* contrasted sharply with the emotional paraphrasing of the *Daily News*, whose headline became a famous example of the tabloid style.

By the start of the twenty-first century, the distinction between tabloids and broadsheets had become negligible. Rising paper costs, a shrinking audience, declining advertising revenues, and the general unwieldiness of the broadsheet format (especially for public transit commuters) resulted in many European newspapers shifting to a smaller, tabloid size. Even *The Times* of London, once a paragon of the content associated with the broadsheet, shifted to a tabloid format in 2004 after 216 years as a broadsheet. The switch resulted in an increase in circulation, matching the result when the broadsheet *Independent* made the same change. While a tabloid size during the week, however, *The Times* continues to publish its Sunday edition in broadsheet format.

In the United States, newspapers have been reluctant to shift to tabloid size, but broadsheet pages have shrunk in the face of rising newsprint costs and decreases in the number of advertisements. The page width of *The New York Times* dropped from 13.5 to 12 inches in 2006. The once-10-column-wide *Chicago Tribune* was reduced to an 11-inch-wide page. Page depths—the vertical measure—generally stood at 21 or 22 inches. Another direction has been a mix of

formats. *The St. Louis Post-Dispatch* began running its Saturday edition as a tabloid in November 1996 before moving to a consistent, “compact” broadsheet style each day.

Conclusion

While the large pages of the broadsheet newspaper have traditionally defined what a quality newspaper looks like, the early twenty-first century marked a shift to smaller sizes, and sometimes a move away from broadsheets altogether. This reversal came about because of changes in production and cost. As content style and page size increasingly came to be unrelated, the journalistic distinction between the broadsheet and the tabloid has become less meaningful. Despite this, invoking “broadsheet journalism” continues to connote quality in-depth, serious news.

BUSINESS JOURNALISM

Business journalism refers to reporting and writing about businesses and the economy. In addition, it commonly includes other beats such as labor, the workplace, technology, personal finance, investment, and consumer reporting, as well as investigative reporting focusing on these topics. The field is also known as financial journalism, particularly in countries other than the United States. The common theme in this coverage is money—who spends it, who earns it, who makes it, and where it comes from.

As more consumers of journalism become aware of how the economy and the stock market affect their daily lives, they are increasingly turning to business journalism to explain the significance. This entry first discusses the role of business journalism in the United States, then looks at the historical roots of business journalism and its development alongside the growth of American business and the economy. Finally, it discusses the growth of business journalism since the 1980s and problems that have developed along with that growth, as well as initiatives to improve business journalism.

Role of Business Journalism in the United States

Business journalism in the United States has grown in importance over the past century due to significant changes in the economic makeup of American society. At the time of the great stock market crash of October 1929, less than 10% of U.S. households owned shares of any stock. By 2002, more than 50% of homes owned stock in at least one company, typically through mutual funds or retirement plans. Also feeding public interest in business news is the fact that fewer people in the 21st century remain with one company throughout their careers, which had been typical from the 1940s through the 1970s.

The amount of business journalism exploded since the 1970s, with daily newspapers creating standalone business sections; personal finance magazines such as *Money*, *Worth*, and *Smart Money* launching; and the number of business journalists working in the country tripling in

number to more than 12,000. That number declined to below 9,000 during the second decade of the 21st century as the overall number of journalists fell. There are now more business journalists working for online-only publications, however.

Business journalism is presented in various media forms, including the business section of most daily newspapers, weekly business newspapers found in every major metropolitan market, websites such as TheStreet and MarketWatch covering specific segments of business journalism, and two cable television networks, CNBC and Fox Business Network. There are also business-only newspapers, such as *The Wall Street Journal* and *Investor's Business Daily*, as well as magazines, such as Bloomberg BusinessWeek, Forbes, and Fortune, devoted to business journalism.

Business journalism, in its role as a watchdog on companies and regulators, can be credited for uncovering illegal and unethical practices that have caused investors to lose millions of dollars and workers to lose their jobs. A 2007 Harvard Business School study studied 263 cases of accounting fraud and determined that 29% were identified by the business press before the U.S. Securities and Exchange Commission or the company itself announced an investigation. Further, in 36% of those early identifications, the reporter conducted original financial analysis to support the story.

Early History

Business journalism can be traced back to the earliest forms of communication. David Forsyth (1964) argues that the genesis of writing and the establishment of a numerical system in the Bronze Age (3300 BCE–1200 BCE) stemmed from economic activity. Even the Hammurabi Code, a set of laws created by the sixth Babylonian king in approximately 1760 BCE, established forerunners of today's interest rate and minimum wage laws.

During the 16th and early 17th centuries, wealthy families in Europe employed correspondents throughout the continent to provide them letters with business information useful to further their power. One of these families was the Fuggers, a German family of bankers and traders who needed to keep abreast of events that might affect

the interest rates they charged their clients. From 1568 to 1604, hundreds of letters were written by correspondents hired by the Fuggers, and the information in them was used to determine whether or not to loan money and at what rate. They also included prices for products and services in the city from which the letter originated. These Fugger newsletters began what has evolved today into the complex system of providing information about business and the economy, which in the early 21st century is available almost instantaneously through the Internet and other media forms.

Many newspapers in the 18th and 19th centuries were created to allow businesses to notify members of the community about the products and services being offered for sale, and early newspapers carried such business information as the cargo of ships arriving in a city's harbor. These newspapers were commonly called *price currents* because they listed the current prices of various products offered for sale by local merchants, and they rarely, if ever, contained any editorial content. The papers were strictly informational and extremely numbers intensive. Among the products listed in most price currents were cotton, flour, furs, leather, oil, animal skins, tobacco, and wheat.

A Philadelphia price current from 1783 also listed sample wages for workers such as carpenters, sail makers, and blacksmiths, and later price currents included information about shipping traffic. Price currents were published in the cities of Baltimore and Boston in the late 18th and early 19th centuries. The *Boston Daily Advertiser* was one example: it listed prices for foreign and domestic goods on the front page, and most of the rest of the four-page broadsheet contained shipping information and small advertisements from merchants.

As American business and the economy began to flourish in the 19th century so did the relevant journalism. James Gordon Bennett's *New York Herald* was the first newspaper that regularly devoted a large amount of space to business and economic news. Started in 1835 on Wall Street, the *Herald* developed the best financial section of any of the mainstream newspapers, according to Forsyth. Bennett was a former economics teacher, and he often wrote what he called the *money page*, which was used to

explain why stock prices rose and fell. A member of his financial reporting staff, Thomas Prentice Kettell, began writing a financial column for the *Herald* in 1835 and is considered the first financial editor of any daily newspaper in the country. Kettell went on to found *United States Economist* in 1852.

Perhaps the most influential business journalism in the United States during the 19th century occurred in an industry newspaper, the *American Railroad Journal*. Edited by Henry Varnum Poor from 1849 to 1862, the publication extensively covered the booming railroad industry. Poor expanded business journalism from its tendency to simply regurgitate facts and figures of products for sale by requiring the railroads to provide financial statements to his publication. He then dissected these financials for his readers, reporting whether he thought the company was a good investment. This was the first time that business journalism explored the profits or losses of companies in any depth. Poor later collected his data into a book, and his company (today known as *Standard & Poor's*) tracks the finances of every major industry.

Important Developments

By 1840, the Industrial Revolution had resulted in larger companies with more complex structures and control of local communities, and as a result, journalists began to pay more attention to business. *The Wall Street Journal* was founded in 1889, providing investors with information about the stock market and business news in New York City. Acquired by Clarence Barron in 1902, it expanded with editions in Philadelphia and Boston and then started a weekly newspaper named after its founder in 1921. While muckrakers Ida Tarbell, Lincoln Steffens, and Upton Sinclair were not considered business journalists, they wrote widely about business practices and their impact on government and society. Tarbell's "History of the Standard Oil Company" set the future standard for how companies would be covered by journalists because she used public records such as lawsuits and depositions to make her argument that the company had undue control of the U.S. oil market.

The first three decades of the 20th century saw an important development in business journalism—the creation of magazines devoted solely to business and the economy. The now-defunct *Financial World* started in 1902 and the U.S. Chamber of Commerce began publishing *Nation's Business* in 1907. *Forbes* was started in 1917 by a syndicated business columnist for the New York American. McGraw-Hill began publishing *The Business Week* in 1929 and Time Inc. founded the monthly *Fortune* early in 1930.

Most publications focused on business journalism suffered circulation declines during the Depression, but none was hurt more than *The Wall Street Journal*. It was seen as a stock market booster, and 1932 congressional hearings uncovered that some investors had been paying the paper's journalists to write favorable stories about companies whose shares they held. The Journal remade itself in the late 1930s and 1940s into a more critical business newspaper and one that provided a business angle to nearly every news story. Its lead after the Japanese bombed Pearl Harbor on December 7, 1941, stated that "War with Japan means industrial revolution in the United States."

As the postwar economy expanded exponentially in the 1950s and 1960s, business journalism grew as well. The New York Financial Writers' Association, which had been created in 1938, and the Society of American Business Editors and Writers, which started in 1964, took on increasingly important roles in promoting business journalism in the country. Both have developed professional standards and ethics codes that prohibit business journalists from participating in the stock market or from accepting gifts from companies they cover—two common practices in earlier years.

Business journalism on television began to gain traction in the late 1960s. Louis Rukeyser began covering business and economics stories for ABC News in 1968, and in 1971, he started hosting *Wall Street Week* on public television. Irving R. Levine began reporting regularly about business and the economy on NBC News that same year. Both became news fixtures in the 1970s, discussing the Arab oil embargo, inflation, price controls, and the changing stock market. The first business news program on U.S. television was *Nightly*

Business Report, which began airing in 1979 on public television stations around the country. It remains a fixture today, airing on more than 250 stations, but is now owned by CNBC.

Growth and Problems

The dramatic growth in the stock market throughout much of the 1980s and 1990s caused a dramatic expansion of business journalism—and led to many problems. Dozens of journalists began covering business and economics stories without a real understanding of the issues and the nuances of how to properly report and write about those topics. Business journalism in the 1990s was criticized—albeit after the fact—for being too boosterish to industries such as the Internet and telecommunications while turning CEOs of some companies into celebrities, praising them for their operation's results without examining the underlying warts, which included the fact that many of them were not making money for their shareholders.

After the tech bubble burst and the stock market began to drop in March 2000, companies such as Enron, WorldCom, Adelphia, and others were exposed as having duped investors, workers, and the business journalists covering their respective industries into believing fraudulent accounting practices that made the companies look stronger than they actually were. As tech companies began to fail because of their accounting practices, the accounting techniques of other companies began to be reviewed. Some business journalists were criticized for having failed to uncover the scams earlier.

Most of the bigger media outlets compete against each other with their business coverage. *The New York Times* and *The Wall Street Journal*, for example, go toe to toe on many business news stories, such as mergers and acquisitions and corporate scandals. In addition, wire services such as Reuters, Dow Jones Newswires, Bloomberg News, and the Associated Press compete to have the best coverage on almost every story every hour of the day. Like most mass communication forms, however, business journalism is undergoing dramatic change in the early 21st century. Virtually every daily metro newspaper has cut its standalone business section and business news now appears in

other sections of the paper. In addition, printed stock and mutual fund listings have been dropped from many newspapers and now appear on related websites, primarily as a way for newspapers to trim printing costs.

Business magazines are struggling to overcome a decline in print advertising that has led to fewer pages for stories. Some business titles, including Time Warner's *Business 2.0*, Dow Jones' *Smart Money* and Time Inc's *Money*, ceased publication because of the advertising decline. The decline in business magazine advertising has been attributed to the increase in Internet advertising by companies such as computer makers and auto makers.

However, business journalism on cable television and in specialized newspapers is growing. The Fox Business Network launched on October 15, 2007, to compete with CNBC, which had the cable business journalism market to itself after Time Warner's dedicated financial news channel, CNNfn, stopped airing in 2004. The Fox Business Network surpassed CNBC in total viewers in 2016, although CNBC argues that the Nielsen ratings don't reflect its true audience, which primarily view in offices and trading floors. *The Wall Street Journal*, acquired by News Corp. in 2007, continued to see circulation gains as of 2020, when it reported having approximately 3 million total subscribers, including 2.2 million digital-only subscribers. As of 2019, rival *The Financial Times* had 1 million total subscribers, with three fourths paying for a digital subscription. Weekly business newspapers owned by American City Business Journals and Crain's Communication continue to boast advertising and circulation gains as they focus their business news on small- and medium-sized companies that often go unnoticed by the larger business media. They too are now charging for online access to their content.

Several developments in business journalism may improve the quality of reporting. The expansion of the Internet has made it easier for business journalists to gain access to documents and public records that allow them to cover companies in more depth. Until the mid-1990s, documents filed with the Securities and Exchange Commission by the 12,000-plus public companies—those whose shares trade on one of the major stock markets—could only be obtained for a fee from a service based in Washington, DC The Securities and

Exchange Commission now provides all corporate documents online, as do many other federal and state regulators.

Another major initiative is the Donald W. Reynolds National Center for Business Journalism, launched in 2003. First based at the American Press Institute, it is now part of the Walter Cronkite School of Journalism and Mass Communication at Arizona State University. Despite advances in the quality of business journalism, the training is sorely needed. A study in the spring/summer 2002 *Newspaper Research Journal* found that journalists believed that education about business was needed for them to be able to do their jobs more effectively. They also believed that such education should apply for all journalists, not just those covering business and the economy.

Multiple business news organizations were sold to new companies during the 2010s. Bloomberg News acquired *BusinessWeek* while TheStreet was sold to Maven. Time Inc. sold *Fortune* and *Money* to Meredith Corp., which in turn sold the titles in 2018 and 2019, respectively, after first shutting *Money's* print operation. The website Business Insider was sold to a German media company in 2015, and the website Quartz was sold to a Japanese company in 2018. *The Financial Times* was sold to Japanese publisher Nikkei in 2015. Business magazines have also cut the number of print issues while focusing more on their websites for growth. Indeed, most business news organizations are now looking online for readers and revenue. *Forbes*, for example, now receives more than 60% of its ad revenue from digital, and Bloomberg News joined *The Wall Street Journal* in adding a paywall in 2018 for its online content. The future of business journalism appears to be in how these operations can generate revenue on the Internet.

BUSINESS MAGAZINES

The addition of the magazine format to business journalism allowed for more in-depth coverage of the economy and Wall Street, companies in the business world, as well as business-related issues. Business magazines do this, first, by providing articles that are much longer than those in newspapers and online news sites. Second, business magazines introduced different story types to the world of business journalism, such as company profiles and strategy articles, allowing business magazine articles to go deeper than just discussing business practices and performance. By providing critical analysis and new angles not covered by traditional news sources, business magazines have become important in helping c-suite executives, business owners, partners, and managers, as well

as anyone else involved and/or interested in business, understand the business world, develop strategies, and make business decisions. This entry offers an overview of the development of business magazines and discusses some examples of successful magazines in the genre.

Development

Business magazines began playing an important role in covering business and the economy in the first half of the 20th century, a time when major dailies did not understand the importance of business and industry news coverage to readers. In the 1920s, readers wanted to know why the economy was booming. Then in the 1930s and 1940s, when the economy went through the Great Depression, business magazines analyzed what happened and offered readers strategies to become profitable again. General news magazines (e.g., *Time*, *Life*, and *Newsweek*) covered Wall Street, business issues, and various industries during this time; however, none provided the depth of coverage offered by magazines solely devoted to business coverage. The three most influential business magazines, *Forbes* (started in 1917), *BusinessWeek* (started in 1929), and *Fortune* (started in 1930), each made important contributions to the world of business journalism and changed how journalists covered companies, investing, and the economy.

Forbes

In 1917, Bertie Charles Forbes started the first business-specific magazine devoted to doers and doings. As a result, Forbes wanted to call the magazine *Doers and Doings*, but his business partner Walter Drey convinced him to use his last name because it was so well known in the investment community. However, the cover of the first issue of *Forbes* magazine did include the words *devoted to doers and doings*. The first issue, which sold for 15 cents, also featured articles on New York banking laws, utilities, big bankers forecasting money rates, as well as a story about women in business written by a woman (which was surprising given there were few women in business and few women writing about anything, especially business), and an interview with John D.

Rockefeller with a tagline on the cover that read “How Forbes gets big men to talk.”

During the 1920s, *Forbes* remained the only major business magazine in the United States and became known for profiles like Rockefeller’s, more so than any other business publication. B. C. Forbes was very interested in the personalities within business, and he became most well-known for pioneering personal profiles of business leaders. In 1996, Timothy Forbes, Forbes’ grandson, attributed personality profiles becoming commonplace in business journalism to his grandfather’s efforts, saying he helped the genre move away from simply covering statistics to capturing the stories of the people behind the statistics. More specifically, he described his grandfather as the humanizer of business.

In addition to profiles, *Forbes* provided investment advice. However, this caused the magazine to lose subscribers after the stock market crash in 1929, when the magazine still ran articles encouraging investment despite the crash. The magazine stayed in business because of income from Forbes’ syndicated column titled “Fact and Comment,” which he started while working at the *Journal of Commerce* before running it in 100 newspapers and then in *Forbes*. However, *Forbes* went from being the only major business magazine to ranking third behind *BusinessWeek* and *Fortune*. *Forbes*’ circulation did rise after the Great Depression in the 1950s and 1960s under the direction of Malcolm Forbes, B. C. Forbes’ son who took over running the magazine after his death in 1954, but it still ranked behind *BusinessWeek* and *Fortune*. It was not until Malcolm Forbes and Editor James Michaels led the magazine to become more critical in their coverage that their circulation passed that of *Fortune* in 1976.

Also, regardless of its downturn in circulation during the Great Depression, *Forbes* represents an important part of business journalism’s history. Not only was it the first magazine solely devoted to business coverage, but B. C. Forbes was also one of the first well-known business journalists to both the business world and to readers, and the magazine’s focus on profiles and investing was a new practice in business journalism. As of 2021, the magazine continues that tradition, focusing on profiles of influential entrepreneurs in the business world, especially through lists such as 30 Under

30 (the top young entrepreneurs), The Forbes 400 (the 400 wealthiest Americans), Self-made Women (the most successful women entrepreneurs), World’s Billionaires, and The Forbes 400 philanthropy score (listing Forbes 400 members by their generosity). *Forbes* is also well-known for its investment newsletters.

Furthermore, when Steve Forbes, Malcolm Forbes’ son, took over as editor in chief after his death in 1990, he launched several spinoff magazines, such as *Global Business and Finance* (started in 1998), as well as international editions in Asia (started in 1998) and Europe (started in 2005). As of 2019, *Forbes* magazine had 40 local editions in 70 different countries. Even with the decline of traditional print media (*Forbes*’ print business lost \$100 million in revenue between 2008 and 2018), the U.S. edition has 6.4 million print readers, and the company fully replaced that revenue with its digital platforms. *Forbes* has tablet and mobile editions, as well as 26 websites around the world with an average of 111 million monthly visitors and 74 million monthly visitors in the United States.

BusinessWeek

McGraw-Hill Publishing Co. started a new business magazine called *The Business Week* in September 1929. Unlike *Forbes*, *The Business Week*’s focus was the economy, hence why a thermometer ran on the cover of the magazine in the 1930s through 1961, gauging the temperature of the American economy. The thermometer graphic also illustrates another important part of *The Business Week*’s vision (counter to that of *Forbes*): interpreting what was going on in the business world, instead of profiling it. As a dig to *Forbes*, Malcolm Muir, the president of McGraw-Hill, who helped start *The Business Week*, said the magazine would never solely chronicle events without interpreting their significance. Furthermore, Muir added *The Business Week* would always have strong opinions and would never hesitate to express those opinions.

Instead, *The Business Week* drew inspiration from *Time* magazine’s format by creating distinct departments (e.g., Business Outlook, Washington Outlook, production, marketing, labor, finance, management, transportation, as well as government

and business abroad) that published regular features. The magazine's first Business Outlook section originally described stocks as unsafe earnings. However, its November 2, 1929, issue also said the Wall Street crash did not foreshadow a serious business depression, making it one of many business publications that failed at predicting the Great Depression. Started just 7 weeks prior to the stock market crash, *The Business Week* lost \$1.5 billion in revenue from 1929 to 1935.

However, unlike other business magazines struggling during the Great Depression, *The Business Week* had a few advantages. First of all, *The Business Week* was able to provide more timely business coverage by publishing a new issue every week, in comparison to *Forbes*, which came out every 2 weeks and *Fortune*, which in the beginning was published monthly. Second, its strategy of having a strong opinion as well as providing analysis led the editors to advocate that the U.S. government take aggressive steps to revive the economy. For example, in October 1930, the magazine complained that the Federal Reserve was standing by idly and a House consumption tax bill was fiscal suicide that would cause further deflation in March 1932. The magazine defines this as one its finest hours.

Besides analyzing the crumbling economy in the 1930s, the magazine reinvented its brand by dropping the "the," becoming just *Business Week* in 1934 and then later *BusinessWeek* (all one word). Also, it continued its coverage of various industries but with a special emphasis on management. There was a postwar explosion of new businesses and technologies, and in order to thrive during a difficult economy, many managers had to develop skills quickly for unfamiliar enterprises. *BusinessWeek* wanted company managers to learn business strategies and management tips, even if the articles were not about their industries. Furthermore, other types of coverage distinguished *BusinessWeek* from its competitors, including analyzing societal shifts that impacted business (e.g., women moving up the corporate ladder in the 1970s) as well as how business influenced society, such as urban issues and the Civil Rights Movement in the 1960s.

Starting in 1984 through the 1990s, *BusinessWeek* became more aggressive under the

leadership of Editor-in-Chief Steven Shepard, who believed the magazine needed editorial change, despite its deep reporting and profitability. One of his first acts was giving bylines to writers. Furthermore, under his two decades of leadership, the magazine added an international edition, won multiple National Magazine Awards, launched businessweek.com, and by 1999 reached a circulation of 1.2 million, making it the world's most widely read business magazine. Ten years later, it had 4.8 million readers in 140 countries.

However, during the dot-com boom's profit surge, more and more people were turning to the Internet for free news and information, causing a decline in subscriptions and advertising revenue. As a result, in 2009, McGraw-Hill put the magazine up for sale, and it was bought by Bloomberg LP and then redesigned and rebranded with a new name: *Bloomberg Businessweek* (with a lowercase "w"). Following the magazine's tradition, it still has a staff divided into various departments that match the print magazine's sections and is devoted to the same types of coverage but now has a multiplatform presence online, through a mobile and tablet app, as well as a TV show, radio show, and podcast. As of 2017, *Bloomberg Businessweek's* print magazine has a global circulation of 600,000 with more than 3 million monthly digital visitors.

Fortune

Henry Luce, the cofounder of *Time* magazine, started *Fortune* in 1930 after noticing *Time* refused to run of a lot of business stories, citing space constraints during the 1920s. He wanted to create what he called a *tycoon's magazine*, dedicated specifically to a small yet exclusive circulation of upper executives because he thought the current magazines, *Forbes* and *BusinessWeek*, did not pay enough attention to this group. Luce also wanted to produce a beautiful magazine using heavy paper with a vivid design, photos, graphics, and charts. Each issue weighed more than two pounds and cost \$1, which was both expensive for readers in a shrinking economy and more than three times the amount of other business magazines usually selling for less than a quarter. In line with his vision, Luce originally wanted to call the magazine *Power*, but his

first wife convinced him to name it *Fortune* because she thought the name would be subtler for readers.

In light of the October 1929 stock market crash, the board of *Time* tried to convince Luce not to start a new magazine, but he knew advertisers would pay good money to reach this audience because they had sufficient income to buy luxury products, and they controlled their companies' finances, making them perfect for corporate advertising. More than half of the 184-page first issue was devoted to advertising, another difference from other magazines at the time. In terms of writing, Luce did not want *Fortune* to offer advice on how to invest or run a business, nor did he want the magazine to take stances on business and economic issues. Instead, he wanted *Fortune* to contain articles that were more descriptive and entertaining as well as informative, so he recruited journalists who did not always know a lot about business to allow for a more literary style.

However, the Great Depression forced Luce to do the exact opposite of his vision in order to reflect the problems of the economy. In the 1930s, *Fortune* changed from being pro-business to more critical, challenging businesses that did not want to be covered and showing how issues such as starvation and homelessness were a direct result of business failures. Also, Luce changed the tone of the magazine and started inserting content in line with his political opinions starting in 1932, with a feature citing Hoover's failure to acknowledge the severity of the Great Depression alongside a favorable review of President Franklin D. Roosevelt's New Deal legislation. As a result of the editorial content changes, *Fortune's* circulation, advertising revenues, and profits started to rise. By 1935, the magazine had more than 100,000 subscribers. In 1937, despite recording close to \$500,000 in profits that year, *Fortune* did become critical of Roosevelt's plan to rebuild the economy when business conditions worsened.

Even as it became more pro-business in the 1930s and 1940s, covering political issues and their effect on businesses became a staple in *Fortune* magazine, and it was one of the first publications to recognize the relationship between government and business. *Fortune* is also recognized for evolving business journalism to include political and societal issues, unique businesses not usually covered by business news, as well as inventing the corporate profile. These articles,

which take an in-depth look at a single corporation, taught journalists how to write about companies and are used by every media outlet that covers businesses and their strategies.

Starting in 1955, *Fortune* became known for its list of the 500 largest companies ranked by revenue, called the *Fortune* 500. The magazine has other famed lists such as the *Fortune* 1,000, the Global 500, 100 Fastest Growing Companies, 100 Best Companies to Work For, World's Most Admired Companies, and The Unicorn List of billion-dollar tech companies, to name a few.

To keep up with its growing popularity, *Fortune*, which was a monthly magazine from 1930 to 1978, began publishing biweekly. The print magazine was the foundation of *Fortune* for its first 70 years, but in 2009, the number of issues per year was cut to 18 instead of 25 because of a 34.9% drop in ad page sale. *Fortune's* ad sales continued to drop another 25% in 2018. This drop led Meredith Corp., the owner of *Fortune*, to sell the magazine to Thai businessman Chatchaval Jiaravanon for \$150 million after acquiring Time Inc. earlier that year. Jiaravanon said he would increase investment in *Fortune's* geographic expansion, editorial talent, and of course, digital presence.

Fortune's online presence hosted by CNN.com started in 2004. Then in 2014, after Time Inc. became a company apart from Time Warner, *Fortune* launched its own website. As of 2019, *Fortune's* online audience is wide, totaling 8.9 million, and its total print circulation of 14 issues a year is around 850,000.

Other Successful Business Magazines

Forbes, *BusinessWeek*, and *Fortune* are not the only business magazines to find success and add value to the world of business journalism, especially in the area of personal finance. W. M. Kiplinger created the U.S.'s first personal finance magazine, called *Kiplinger Magazine*, with the subtitle "The Changing Times" in 1947. Two years later, it changed its name to *Changing Times* with the subtitle "The Kiplinger Magazine" until 1991, when it was given the name it is known for today: *Kiplinger's Personal Finance*. Similarly, Time Inc. started *Money* magazine in 1972 to teach readers about investing and managing money, because Luce originally wanted to keep

personal finance advice out of *Fortune*. Next, in 1992, the *Wall Street Journal's* parent company Dow Jones and media giant Hearst Corp. started *Smart Money*.

As with personal finance, a lot of other business magazines have created their own niches within the business magazine industry. For example, *Wired* (started in 1993) is a business magazine with a specific focus on technology. *Entrepreneur* (started in 1977) and *Inc.* (started in 1979) offer small business owners and startups advice on money and management. *Harvard Business Review* (started in 1994) provides a bridge between academia and the corporate world while also targeting those in management positions. *The Economist* (originally started as a newspaper in England in the 1840s before evolving into a weekly magazine) offers a global perspective on business news. *The Economist* is also known for being lengthier with a uniform tone because the writers are anonymous.

BuzzFeed

BuzzFeed is an independent American news and entertainment digital media company headquartered in New York City with other offices in the United States and around the world. With 92 million unique U.S. visitors across multiple platforms in December 2019 and a global audience of over 520 million, BuzzFeed's success lies in their ability to create entertaining and viral content geared toward millennials.

Founded in 2006 by Jonah Peretti and John S. Johnson III, BuzzFeed produces both original and community-driven viral content using a multiplatform approach, which differs from traditional media channels in the creation and distribution of content. BuzzFeed content is created daily and distributed across websites and social networking services such as Facebook, Twitter, YouTube, Snapchat, TikTok, and Instagram. BuzzFeed remains known for its ability to deliver original content that generates “buzz” and encourages users to share content with others in their social circle.

BuzzFeed utilizes a traditional organizational structure where everything from content creation to advertising is kept in-house. BuzzFeed's popularity originated from providing entertainment journalism (e.g., viral videos, quizzes, and pop culture articles) for a young and digitally savvy target audience before expanding to offer

award-winning investigative journalism. BuzzFeed has expanded to include multiple brands such as Tasty (food-focused social networking), Nifty (money-saving hacks and do-it-yourself projects), Goodful (health and food), As/Is (lifestyle), and Bring Me! (travel). BuzzFeed's network includes BuzzFeed Originals, BuzzFeed Media Brands, BuzzFeed Studios, BuzzFeed Community, BuzzFeed News, and BuzzFeed Commerce. In 2021, BuzzFeed acquired HuffPost in a stock deal with Verizon Media. BuzzFeed has relied heavily on native advertising as a source of revenue. In 2015, BuzzFeed's estimated net worth was \$1.5 billion, and as of 2019, BuzzFeed had over 1,100 employees. This entry discusses BuzzFeed's origins and business model, its various brands and networks, and some of the notable feature stories, videos, and news articles it has published.

Origins

During a time when the digital media landscape was drastically changing, BuzzFeed provided users with copious amounts of viral and entertaining original content. BuzzFeed also strategically sought to understand the emotions and demands of its target audience in order to ensure that original content was shareable and viral, metrics of a successful post. BuzzFeed quickly became known for listicles, or articles presenting items as lists, including "15 Links to Animal Pornography" and "20 Celebrity Nipple Slips." Another staple of BuzzFeed content is online quizzes such as "Half the Population Can't Pass this High School Simulation Without Cheating—Can You?" To encourage audience members to share posts, BuzzFeed often focuses on topics that are part of their identity or lives such as their generation (e.g., "32 Extremely Specific Things Every Single Millennial Hasn't Thought About In YEARS"), favorite TV shows (e.g., "25 'Brooklyn Nine-Nine' Facts You Probably Didn't Know, But 100% Should"), and gender (e.g., "19 Reasons Why Women are So Much Stronger Than Men Could Ever Dare To Be"). BuzzFeed tracks which content pieces are going viral and which are being shared among its target audiences.

In order to provide more viral content, BuzzFeed strives to understand its target audience. This is accomplished by providing users an opportunity

to identify their emotional reactions when consuming BuzzFeed content by clicking on reaction badges (e.g., LOL, OMG, CUTE). This not only allows target audiences to identify their emotional reactions to content but also provides target audiences an opportunity to seek out emotionally specific content. In addition, quizzes such as "Deep Truth Personality Test: Your Emotional Responses to 8 Images will Reveal a Deep Truth About You" and "Your Reaction to these Weird Food Photos Will Reveal Your Emotional Age" allow BuzzFeed to strategically tap into the emotional reactions of consumers. By doing so, BuzzFeed is able to gauge what target audiences want to see while also building an emotional connection.

Business Model

Traditional media (i.e., print, radio, newspaper, and television) utilizes a one-to-many paradigm of one-way communication where a single source or publisher provides information to mass audiences. In contrast, BuzzFeed employs a many-to-many content distribution model where media content is generated and received from multiple sources such as websites, videos, and social media platforms. Traditional media companies also usually aim to drive traffic to their websites. In contrast, BuzzFeed aims to reach its target audience directly by posting original content on social media that is tailored to specific platforms such as Facebook and Instagram. Approximately 75% of BuzzFeed's traffic comes from social media platforms. Of the various social media platforms, Facebook delivers the majority of BuzzFeed's traffic.

BuzzFeed Community

BuzzFeed not only creates original viral content but also works as an open-publishing organization where consumer-generated content is also used. BuzzFeed Community gives users the opportunity to submit original content that may be featured on BuzzFeed. Consumers can apply to become a "BuzzFeeder" and create original content such as quizzes, listicles, or short articles using instructions from BuzzFeed so that the content matches the tone and look of BuzzFeed's original content. Once a BuzzFeeder publishes

their original content, BuzzFeed staff decide whether to promote the original content on BuzzFeed. BuzzFeed rewards community-generated content with digital badges such as trophies that can be displayed on a BuzzFeeder's profile page and content byline. In addition, the virality of a community-generated content piece is measured with "likes," "views," and "engagement," which can earn "Internet points" for a BuzzFeeder.

Native Advertising

BuzzFeed's business model does not charge users for access to its content through a paywall (e.g., monetary membership needed to access restricted media content), and until 2017, it eschewed traditional digital advertising channels such as banner advertisements or display advertisements. Instead, it generated revenue through native advertising, original content created by BuzzFeed for brands that matches the tone, look, and style of BuzzFeed content. BuzzFeed charges organizations a fee to have custom content created for their target audience and to be displayed on BuzzFeed. For example, Toyota's Prius partnered with BuzzFeed and created a listicle titled, "The 20 Coolest Hybrid Animals."

While BuzzFeed utilizes a multiplatform approach to the distribution of its content, native ads are only published to one platform. For example, Bud Light partnered with BuzzFeed in 2018 to promote a new fruity beer product titled "Bud Light Radler." BuzzFeed created a native advertising campaign that aimed at bridging the relationship between having brunch and drinking beer. Two sponsored BuzzFeed recipes, "Beer Bread French Toast" and "Radler's Chicken & Waffles," were created and featured on BuzzFeed's Tasty food-focused video channel. The native advertising campaign generated over 20 million impressions, 6,000 video views, 42,000 comments/reactions, and 14,000 shares.

While native advertising has successfully generated revenue for BuzzFeed, in 2017 Peretti announced that BuzzFeed would pivot from native advertising as the main source of revenue. Along with other forms of advertising, new revenue streams would include expanded efforts in creating and expanding BuzzFeed-owned brands (e.g., Tasty, Goodful, As/Is) while also expanding

licensing opportunities for various successful web series such as *Worth It* and *BuzzFeed Unsolved*.

BuzzFeed Divisions

BuzzFeed has several different divisions, including BuzzFeed Originals, BuzzFeed Media Brands, BuzzFeed Studios, and BuzzFeed News.

BuzzFeed Originals

BuzzFeed Originals concentrates on producing original social content such as short articles, listicles, entertainment quizzes, and viral videos that tap into popular culture. Characteristics of BuzzFeed Original content include it being easy to consume and widely shared through social networking sites. BuzzFeed often uses animated GIFs and pictures in their listicles. BuzzFeed entertainment quizzes are immensely popular because users complete the quiz, share their results, and encourage other members of their social circles to also complete the quizzes so that results can be compared.

BuzzFeed Media Brands

BuzzFeed Media Brands has launched several successful sub-brand products and partnerships. One of the most successful sub-brand products is BuzzFeed's Tasty, a food-focused brand that features short instructional food recipe videos primarily shown on social media platforms such as Facebook, YouTube, and Instagram. As of May 2020, BuzzFeed's Tasty had over 1.2 million Twitter followers, 103 million Facebook followers, 98 million Facebook page likes, 18.7 million YouTube subscribers, and 37.6 million followers on Instagram. Time-lapsed videos range from 60 to 90 seconds and its main target audiences are millennials and members of Gen Z. Tasty has several global spinoffs such as Proper Tasty (United Kingdom), Bien Tasty (Mexico), Tasty Japan, and Tasty Demais (Brazil).

Partnering with several corporations, Tasty has launched several branded kitchenware line products, cookbooks, and food products. For example, BuzzFeed's Tasty partnered with Penguin Random House and published five cookbooks titled *Tasty Pride*, *Tasty Every Day*, *Tasty*

Dessert, *Tasty Ultimate*, and *Tasty's Latest and Greatest*, which have together sold over 1 million copies. Partnering with Walmart, over 90 Tasty-branded kitchenware products are sold exclusively at Walmart. In 2019, a Tasty app was created that allowed users to concurrently search for BuzzFeed cooking recipes while also shopping for ingredients directly from Walmart.

Other sub-brands include BuzzFeed's Goodful, a wellness brand that focuses on healthy eating and wellness, has partnered with Macy's to launch over 100 Goodful cooking and wellness products. BuzzFeed's Nifty sub-brand focuses on money-saving hacks and do-it-yourself techniques and has partnered with American Express with an "Epic Everyday" campaign that targets older millennials. As/Is, a lifestyle brand, focuses on body positivity and individuality. As/Is features several original digital series such as *Close Up*, *Bogus Beauty*, *Feed Famous*, and *Ladylike*. Bring Me! focuses on travel content and has worked with major corporations such as Tourism Australia, Volkswagen, Hyundai, AMEX, and PepsiCo.

BuzzFeed Studios

BuzzFeed Studios, originally named *BuzzFeed Motion Pictures*, creates original content for subscription video on demand, broadcast, and digital platforms. In a partnership with Netflix, BuzzFeed Studios produced one season of an American documentary television series titled *Follow This* that explored various topics focused on Internet subcultures, sexuality, and politics. BuzzFeed Studios also produced an online comedy series titled *The Try Guys* (2015–2018), featuring a four-person team that has created some of BuzzFeed's most viral videos such as "The Try Guys Try Labor Pain Simulation" and "Guys Try on Ladies' Underwear for the First Time." *The Try Guys* viral videos have generated over a billion views. In 2019, stars of the show Keith Habersberger, Ned Fulmer, Zach Kornfeld, and Eugene Lee Yang separated from BuzzFeed and became their own independent company while retaining the branded name, *The Try Guys*.

Other notable original programming includes *BuzzFeed Unsolved: True Crime* and *BuzzFeed*

Unsolved: Supernatural, documentary-style web series created in 2016 that examine hauntings, unsolved crimes, mysteries, and, paranormal activity. The shows, hosted by Ryan Bergara and Shane Madej, air on BuzzFeed Unsolved Network, YouTube, Hulu, and Amazon Prime and are among the most watched BuzzFeed programs. *Worth It*, another successful web series, stars Steven Lim and Andrew Ilnyckyj, who sample and critique similar foods at three different price points ranging from affordable to extravagant such as an episode titled "\$2 Pizza vs. \$2,000 Pizza." The web series spawned additional spinoffs: *Worth It: Lifestyle* and *Worth It UK*.

BuzzFeed News

In December 2011, BuzzFeed launched Buzzfeed News, which concentrates on investigative journalism, news reporting, and is a member of the White House Press Corps. BuzzFeed hired former Politico journalist Ben Smith as editor in chief of BuzzFeed News the same year to expand BuzzFeed's news coverage. Distinct from the main BuzzFeed site, BuzzFeed News has its own website domain and a separate news app with customizable alerts. In contrast to other news sites that divide new stories into traditional topics (e.g., local, world, political, sports), BuzzFeed News site includes a trending news bar with popular stories decided upon by BuzzFeed News editors. BuzzFeed News reports on social issues, the government, and politics. It has won numerous awards including the National Magazine Award in 2016, the National Press Foundation Awards in 2014 and 2016, the Sidney Award in 2015, and the British Journalism Award in 2017. In 2017 and 2018, BuzzFeed News journalists were finalists for the Pulitzer Prize in international reporting. In 2018, Melissa Segura of BuzzFeed News won the George Polk Award in Local Reporting for her series, "Broken Justice in Chicago" that exposed a Chicago police detective of framing innocent men for murder and ultimately resulted in the exoneration of a dozen men. In 2021, Ryan Mac and Craig Silverman of BuzzFeed News won the George Polk Award in Business Reporting for a series of reports on how Facebook exposes the public to fraud, disinformation, and violence.

In May 2020, Smith resigned from BuzzFeed News and was hired as a media columnist for *The New York Times*. BuzzFeed News hired Pulitzer Prize-winning journalist Mark Schoofs to become the new editor in chief. Schoofs developed BuzzFeed News's investigative reporting team when he was formerly employed at BuzzFeed in 2014. Schoofs continues to serve as a visiting professor at University of Southern California (USC) Annenberg School of Communication and Journalism, which he joined in 2018, and has built a collaboration between BuzzFeed News and USC Annenberg. When Schoofs was appointed editor in chief, BuzzFeed announced plans for him to teach one journalism course at USC in the fall and for Peretti to teach a course on "internet culture, networks, and digital media." BuzzFeed News also planned to offer USC students an opportunity to intern at BuzzFeed.

BYLINE

Bylines are used to give credit to writers who pen articles for print or online publications. They can take multiple forms and come either at the beginning of an article or the end. Typically, a byline names the person who wrote the article and sometimes gives that person's position at the publication. The byline may appear separate from the story as in this example:

Debbie Reddin
Staff Reporter

This entry discusses the history of bylines, types of bylines, gendered uses of bylines, and ethical considerations of using bylines.

Credit for authorship might also appear as part of an editor's note that describes the story's content or offers some contextualization about why the story is important or how it was acquired. In that case, the credit is not considered a byline. Credit may also be given at the end of a story as a signature. In that case, it usually runs flush right (aligned to the right-hand margin) and might look something like this:

—Debbie Reddin

The signature is the oldest form of authorship credit used in American newspapers. This sort of credit line dates back to the colonial era when readers anticipated most content to be written by a newspaper editor. If the editor commissioned or received (usually through the mail) a letter from a correspondent, he would generally use the signature to signal to readers the piece was not his own. Most 18th- and 19th-century authors would write under pseudonyms (aka pen names).

Pen names were important in the Colonial and Revolutionary eras to protect dissidents from retaliation by English officials. Journalism has always been a dangerous occupation, and in earlier times, readers and subjects with grievances against newspaper writers did not sue them for libel. They challenged them to duels, made lethal visits to their offices, or ambushed them in the street. Anonymity was the reporter's friend, and a pen name was the key to that anonymity.

One of the best examples out of early American history is the Federalist Papers. The Federalist

Papers is a collection of 85 articles written by Alexander Hamilton, James Madison, and John Jay under the shared pseudonym “Publius.” The three penned the letters to help get the Constitution ratified. The letters appeared in the *New York Independent Journal*, the *New York Packet*, and the *Daily Advertiser* between October 1787 and April 1788. They are not, however, the only, nor the first, to take to newspapers either before, during, or after the Revolution to argue political issues. A letter signed “Cato” that criticized New York Governor William Cosby was the precipitating factor in the arrest and trial of *New York Journal* Editor John Peter Zenger. The letter was penned by members of the anti-Cosby faction, James Alexander and Lewis Morris. Cosby had removed Morris as chief justice of the New York Supreme Court in order to replace him with a more compliant chief justice. Neither Morris nor Alexander would have wanted their names directly associated with the letter, even if most politically active New Yorkers would have known they were the likely authors of the piece.

Women writers, in particular, have chosen to write under either pen names or their initials. Women in the 17th and 18th centuries tended to use masculine pen names, thinking they would be taken more seriously than a female name. In the 19th century, some women, including all four known female war correspondents who wrote for Southern newspapers during the Civil War, used pen names: Joan, Virginia, Luna, and E.L.McE. Other women, such as Louisa McCord of South Carolina, a slavery apologist and frequent contributor to Southern magazines such as *DeBow's Review* or the *Southern Literary Review* wrote under her initials and was seemingly known as the *author*. She wrote publicly, however, only so long as her husband was alive.

Consistent use of bylines began during the Civil War when Union General Joseph Hooker became enraged over a story that included information about the manpower and location of his Army of the Potomac. The general complained to the U.S. War Department, and the result was General Order No. 48, which required all reporters to sign their correspondence at least with their initials, if not their full names. Northern newspapers complied for the duration of the war.

The Associated Press and most newspapers had no byline policies until the early 20th century. In part, the decision not to use bylines or to use them sparingly was made by publishers who believed the newspaper, not the individual reporter, was responsible for each story. In his work *The Pen and the Book* (1899), Sir Walter Besant, a British historian, argued that signed articles led writers to think of themselves first and their story second. Also, up until about the 1970s or 1980s, newspapers would employ reporters who would gather news and phone it in to a rewrite man, so many stories would have needed a double byline.

Adolph Ochs, publisher of the *The New York Times* from 1896 until his death in 1935, eschewed bylines until the 1920s when the paper's position on the issue began changing, as did that of many other publications. The first Associated Press byline appeared in 1925, and, according to the *Oxford English Dictionary*, the word *byline* entered the English language in 1926 when Ernest Hemingway used it in *The Sun Also Rises*.

Arguments in favor of bylines have also focused on holding journalists responsible for their reporting. Unsigned pieces are more likely to allow a reporter to engage in irresponsible reporting, argued John Bertram Askew in a 1911 edition of a periodical that dealt with journalistic controversies, *Pros and Cons*. A 2012 article by Reuters writer Jack Shafer argues that bylines are a positive addition to news organs, for they tell readers the identity of authors and do, in fact, hold writers accountable for what they report. The article essentially paints bylines as one antidote for accusations of fake news. It also points out that bylines help good journalists advance faster in their careers, for their work is a known quantity.

However, the modern prevalence of bylines has presented new ethical issues for journalists: fake bylines and accusations of plagiarism when bylines are not fully inclusive of all who worked on a story. Such an issue arose in 2012 with a Chicago-based local-news company, Journatic.

Journatic provided local news to newspapers throughout America by outsourcing assignments to freelancers who worked remotely. Mostly, these remote reporters picked up publicly available information such as real estate transfers, marriage, and death records, and other information easily obtained from the web. Even some of the top

papers in the United States subscribed to Journatic, including the *Chicago Tribune*, the *Houston Chronicle*, *Newsday*, and the *San Francisco Chronicle*.

Many of Journatic's reporters worked overseas in places such as the Philippines, the former Soviet Union, or Africa. Instead of publishing under their own names, Journatic reporters took American-sounding pen names for their bylines. While this practice would have been commonplace 200 years earlier, today it is deemed an unethical practice. Journatic pledged to stop its use of fake bylines after being caught and losing subscribers such as the *Chicago Sun-Times* and GateHouse Media.

A few months after the Reuters article appeared, *The Guardian*, an English newspaper, became embroiled in a byline controversy when the news agency published a scoop about Cisco Systems ending its partnership with a Chinese telecommunications investigation. The Chinese company was accused of violating U.S. sanctions against Iran. A *Guardian* reporter, Charles Arthur, took the wire story, verified it, and did some of his own reporting. He bylined the story with his name and the phrase "and agencies." In the editing process, the "and agencies" phrase got deleted. The *Guardian* Twitter feed automatically pulled the story and publicized it in social media as being exclusively by Arthur.

The newspaper's reader's representative (ombudsman) investigated a complaint by an American journalist that *The Guardian* had failed

to credit Reuters. The representative concluded that internal policies and procedures needed to be reviewed but found Arthur had not intentionally taken sole credit for the work.

Despite the acknowledged value of bylines, some publications still choose not to use them. Perhaps the most famous is the *Economist*, a London newspaper that appears weekly in magazine form. The *Economist* defends its nonuse of bylines as tradition, citing the fact many of their articles are the product of collaborations between writers, and, taking the Ochsian view that what is written is more important than who writes it. The paper does allow its online writers to sign their articles with their initials, and an occasional special report in the print edition is bylined as well.

CABLE NEWS

The development of cable news networks in the United States began with the launch of the Cable News Network (CNN) on June 1, 1980. Although CNN and its later competitors took years to gain a strong foothold in the U.S. broadcast news market, by the 1990s, the cable news channels or networks had become significant and powerful media organizations as viewership declined or stagnated for the evening news reports of the broadcasting networks (NBC, CBS, and ABC).

Cable news channels focus on news coverage all day, every day. In addition to breaking news reports, these channels often broadcast shows devoted to commentary, especially regarding politics, as well as longer specials or documentaries, some of which blur the lines between entertainment or advocacy and journalism. The networks have attracted criticism for their real or perceived political biases and emphasis on sensation stories, their use of outrage and conflict among commentators and invited panelists, and the ubiquitous, if not always distracting, crawls or news alerts across the lower portion of the television screen.

Although the U.S. market includes several smaller niche players and specialized channels (e.g., weather and sports), cable news is dominated by three large media organizations and their affiliates: CNN, the Fox News Channel (FNC), and MSNBC. After discussing each of these in turn, the entry continues with a discussion of the regional or niche cable news channels and other

alternatives to the three dominant U.S. cable news organizations, concluding with a summary of the criticisms commonly leveled at the cable news networks.

CNN, Breaking News, and the Rise of a New Medium in U.S. Journalism

In the early years following its founding by entrepreneur Ted Turner, CNN struggled to find and maintain an audience and journalistic credibility. The new network had anchors, but at least during the early years, its focus consisted of the news and the reports of correspondents and not the personalities of the anchors. CNN quickly established bureaus around the United States and the world. In 1982, Turner and his Turner Broadcasting System started an affiliate, Headline News (renamed HLN in 2008), which catered to viewers wanting quick news updates every 30 minutes. CNN International, with its emphasis on international reports, came along in 1985. By 1989, CNN was available in 65 countries, but the new network hardly disturbed the dominance of the major broadcast networks or newspapers for the first 10 years of its existence.

The start of the first Gulf War, also known as *Operation Desert Storm*, on January 16, 1991, changed the fortunes of CNN and the status of cable news. As the U.S. and coalition missile launches began, CNN alone had correspondents in and reporting from Baghdad. The live and riveting reports by such CNN reporters as Peter Arnett, Bernard Shaw, and John Holliman lacked

live videography during the initial hours of the military operations, but nonetheless dramatically described the events much as famous CBS journalist Edward R. Murrow had described on radio the Nazi bombing of London early in the Second World War.

Even without the live images, countless other television stations and networks in the United States and internationally carried the CNN reports. This gave an estimated minimum of one billion viewers around the world an introduction to CNN and helped make CNN a respected news organization with which the broadcast networks had to compete. Combining this new credibility and image with the growth of prime-time talk shows such as *Larry King Live* and *The Capitol Gang*, CNN in the 1990s gained international prominence and strong ratings.

A new term, the *CNN effect*, captured this increasing prominence built on its path-breaking coverage of the first Gulf War and the other crises of the 1990s. Coined by Pentagon officials and others in reference to the impact of real-time, 24-hour news coverage on global events and on public policy, the CNN effect also signaled the importance of cable news in the United States. Competition from Fox, MSNBC, and others soon developed and CNN experimented with other affiliated offerings and new technologies. CNN in 2007, for example, was the first cable news network to convert to high-definition broadcasting.

Although the network would later see its ratings slip, its reputation for strong coverage of breaking events and crises remained relatively strong, though not necessarily in the lead, in the early 2000s. CNN was the first cable network to cover the terrorist attacks of September 11, 2001. The network's coverage of other major crises from the tsunami in Japan and NATO airstrikes in Libya in 2011 to its coverage of the U.S. presidential elections of recent years periodically boosted its ratings, but since 2002, the FNC, not CNN, has held the top spot in ratings among U.S. cable news networks.

In 2019, CNN occupied third place in terms of the ratings for the cable news networks, behind the FNC and MSNBC, with an average of 972,000 viewers. The network is currently owned by CNN Worldwide, which is part of AT&T's WarnerMedia. While at times critics have suggested CNN

sensationalizes its coverage of crises, critics coincidentally have also derided CNN for its perceived attempts to be the politically neutral, balanced network—a criticism rarely, if ever, leveled at its chief competitors, the FNC and MSNBC.

The Fox News Channel and the Fox Effect

News Corporation (founded by Australian-born, now U.S. naturalized citizen and media titan Rupert Murdoch) launched the FNC in 1996 to appeal to a right-of-center, conservative audience. FNC has grown into the cable network with the highest ratings, previously marketing itself as the network for “Fair and Balanced” news reports and using such other now famous slogans as “We Report. You Decide” and “Most Watched. Most Trusted.” FNC, under the guidance of Murdoch, Roger Ailes, and Bill Shine, used its right-leaning programming to build a ratings juggernaut with its prime-time lineup of commentators that once included the likes of Bill O'Reilly's *The O'Reilly Factor* and now includes shows hosted by Tucker Carlson and Sean Hannity. Fox News is the top-rated U.S. cable news network, averaging a reported 2.5 million viewers in 2019.

FNC climbed to the top of the ratings heap by innovating in terms of not only content but business strategies as well. To pick up space with more cable systems, FNC reversed the standard practice of requiring that cable systems pay stations carriage fees for using a channel's programming, and instead Fox paid systems a per-subscriber fee to carry FNC. Fox also enlisted the assistance of the now former mayor of New York City, Rudy Giuliani, to convince Time Warner Cable to carry FNC in the city.

Just as CNN launched its various affiliated channels, News Corporation launched some of its own, including a financial news network called *Fox Business Network* (FBN), touted by Murdoch and others at Fox as an alternative to the channels that were not perceived as business friendly. FNC converted high-definition broadcasting in 2008 and currently provides service to 86 countries and territories.

In addition to its right-leaning, Republican Party-supporting programs, FNC has from its start invested heavily in its colorful and dramatic graphics or visual presentations as a means of

attracting viewers and holding their attention. FNC launched the now common “Fox News Alert” to interrupt its regular programming when a breaking news story occurred and whenever the network wanted to emphasize an issue. The network also used on-screen text and bullet points to summarize and bring home its messages to the viewers. As the September 11, 2001 attacks unfolded, FNC innovated again by using a news ticker on the bottom of the screen to update viewers with new information on a continuous basis. FNC continues to use the ticker, whether it relates to what the on-screen reporters or commentators may be discussing or to other events.

As successful as FNC has been at building viewership and a brand based on offering an alternative to what it sees as a liberal bias among other media, FNC has had its missteps and critics. In 2003, the network unsuccessfully sued comedian Al Franken (before he became a senator) over the title of his book *Lies and the Lying Liars Who Tell Them: A Fair and Balanced Look at the Right*. Fox claimed Franken had infringed its trademark by using “Fair and Balanced” on the cover of the book. The cover also used an unflattering picture of O’Reilly, who complained vociferously about it, and included in its text serious criticism of FNC. Three days after a federal judge denied the Fox request for an injunction and seriously questioned the entire basis of the suit, Fox dropped it. By that time, the publicity helped Franken’s book rise to the top of various best sellers’ lists.

In 2004, Robert Greenwald released a documentary film titled *Outfoxed: Rupert Murdoch’s War on Journalism*, a thoroughly documented critique using footage recorded of FNC news reports and commentary as well as leaked internal memoranda and interviews with former Fox employees to make that case that FNC blurred the line between journalism and political advocacy to support the Republican Party and conservative causes.

In July 2016, Ailes resigned following a series of news reports about sexual harassment and misconduct allegations from FNC anchor Gretchen Carlson and several other women, including Megyn Kelly. Ailes received \$40 million from 21st Century Fox (which was at the time the parent company of FNC) as part of his separation. O’Reilly, who had been with FNC since 1996 and

had for many years hosted his very popular evening talk show, became the subject of media reports in *The New York Times* and then other news organizations about his multimillion-dollar settlements with various women who had accused him of sexual harassment. Fox terminated O’Reilly in April 2017.

Without question, the hallmark and central business strategy for FNC has been its right-leaning news coverage and commentary. Executives with FNC from Murdoch through Ailes and many others have made no secret of this approach. Most recently and in the years following the departure of Ailes, many critics have further assailed the network for eroding any line between news reporting and commentary and political advocacy.

For example, FNC prime-time host Sean Hannity has had an acknowledged and even celebrated close relationship with President Donald Trump, one that began during the 2016 campaign and subsequently grew stronger. As of mid-2020, they reportedly continued to speak regularly, if not daily. Hannity has appeared at campaign events, repeated Trump’s attacks on the media and others, and unabashedly defended Trump in all matters on air. In April 2018, immediately after federal agents raided the office of Michael Cohen, President Trump’s now convicted and then personal lawyer, Hannity, strongly attacked the actions by special Counsel Robert Mueller without disclosing that he had also been advised by Cohen. This relationship came to light days later and only after questions by the judge in a court hearing over the raid. FNC did not sanction Hannity for what appeared to be an obvious breach of journalistic ethics. Instead, FNC expressed its strong support for the host.

FNC is unquestionably a powerful influence in U.S. politics and media. At least one scholar has advocated the creation of a Fox studies program to document its influence over policy, the media, and government. The very term, the *Fox effect*, has slipped into the lexicon to signify that influence. Dating back to a 2006 working paper titled “The Fox News Effect: Media Bias and Voting,” subsequently published in the *Quarterly Journal of Economics*, this effect signified the impact of Fox News on elections, voter share, and voter turnout in presidential elections. A later 2012 book, *The Fox Effect: How Roger Ailes Turned a Network into a Propaganda Machine*, by David

Brock and Ari Rabin-Havt, further documented the growing influence of the network and its partisan orientation.

MSNBC and a Third Way in U.S. Cable News

MSNBC and its companion website (msnbc.com) began on July 15, 1996, as a partnership between Microsoft and the National Broadcasting Company (NBC), which was then owned by General Electric. MSNBC and the website had separate business and news operations. The Microsoft headquarters in Redmond, Washington, housed the website. The NBC headquarters in New York City housed MSNBC. Microsoft pulled out of the MSNBC channel in 2005 and msnbc.com in 2012. NBC used NBCNews.com as its news website and msnbc.com for the online version of MSNBC. NBCUniversal, now part of Comcast, owns and operates MSNBC.

In 2019, MSNBC ranked second to FNC among the U.S. cable news networks with an average of 1.8 million viewers. Many consider MSNBC to be a somewhat liberal-leaning alternative to FNC, though this network did not start that way. In the early years, MSNBC tended toward stories that were longer and more involved than those typically found on the other cable news networks. MSNBC drew on its ties to NBC News to report breaking news and air stories by affiliated news organizations. The network also quickly focused more and more on political news.

During its early years, MSNBC included a variety of serious journalists such as John Seigenthaler and liberal commentators and contributors, but also people decidedly to the right of center and now more likely to be found on FNC or a similar outlet (e.g., Laura Ingraham, John Gibson, Ann Coulter, and Tucker Carlson).

In late 2005, MSNBC began changing its apparent strategy as NBC acquired greater control over the network and changes in management occurred. The network at that time started overtly appealing to more liberal and progressive viewers with such hosts as Keith Olbermann, who became quickly known for his sarcastic, biting commentary on politics and FNC and its conservative media personalities, especially O'Reilly. Olbermann was soon joined in the MSNBC on-air

prime-time schedule by Chris Matthews, Rachel Maddow, and other liberal commentators and hosts.

Following the changes initiated in 2005 and revisions to its lineup of shows, the network had some ratings successes and some challenges as it vied with CNN for second place behind FNC. In its 2013 "State of the News Media" report, the Pew Research Center concluded that MSNBC was the most opinionated news network. The study identified 85% of MSNBC's programming as commentary or opinion and only 15% being factual reporting, on which the network spent much less than its two competitors.

Not long after this report, MSNBC shifted its strategy. To reinvigorate its ratings and market identity, the network in mid-2015 moved away from positioning itself as an opinion-oriented, more liberal alternative to FNC and toward being a network that emphasized solid and in-depth news reporting. Although the network kept its early morning and prime-time opinion-oriented programming, it canceled daytime talk and opinion shows and replaced them with news marketed as NBC News shows. MSNBC gained ground in the ratings contest and in May 2017 achieved a first-place ranking for the first time among the U.S. cable news networks, though that title soon returned to FNC, with MSNBC occupying a strong second place.

Niche Cable News Channels and Other Alternatives to the Big Three in the United States

Although FNC, CNN, and MSNBC dominate the U.S. market for cable news, other media entities, smaller and regional or local, also exist. The availability of these cable channels varies widely by region and depending on the cable or satellite service used by the viewer, though as with the other networks just about all of them also operate online and through streaming services as well. Many cater to specific interests, and a few are international.

One of the innovative channels, NewsyTV, began in 2008 for the purpose of producing video-based stories that were compatible with mobile devices and the web, some of which Newsy sold to other media outlets. E.W. Scripps acquired the

fledgling network in 2014, realigning some of its programming and helping to turn it into a national network aimed at younger adult viewers through various cable, online, and streaming services and devices.

Apart from the emphasis on national news, several regional or local 24-hour news networks operate in New York City, New England, the Pacific Northwest, Texas, Florida, and other U.S. metropolitan areas. None of these local or regional channels has built a significant viewership.

Other niche players have loyal and dedicated viewers based on their appeal to specific interests, from sports to the weather or finance. In the world of financial news, CNBC is the dominant player. Originally launched as the Consumer News and Business Channel (hence, CNBC) in 1989 by NBC and Cablevision, the network acquired in 1991 its then chief competitor, the Financial News Network, and solidified its grip on this segment of the market with its combination of daytime, continuous news about business and the markets, and evening business analysis, documentaries, and talk shows. In 2019, NBCUniversal had sole ownership of the channel, which acquired strong competition in 1994 with the inauguration of Bloomberg Television and its many international channels, and in 2007 with the new FBN.

News about the weather and sports also provides the basis for several cable channels in the United States. The dominant entities in terms of weather include the Weather Channel and AccuWeather, with their combination of national and local or regional reports and longer climate-based stories or documentaries. In terms of sports news, in addition to the networks that carry sporting events, there is ESPNNews, owned by ESPN and the Walt Disney Company, and others focused on news about national sport, college athletics, and related issues.

Some smaller networks openly market themselves on the basis of their avowed ideological or political orientation. Glenn Beck and other conservatives, for example, launched the right-wing website called *TheBlaze* in 2010 and it eventually developed into BlazeTV.

Joining BlazeTV in the decidedly right-of-center cable space are two other conservative channels, Newsmax TV and the One America Network. Newsmax Media, which operates conservative-oriented websites and print media, launched

Newsmax TV in 2014. This niche channel uses a rolling news format, conservative talk shows, and the occasional documentary. The family-owned Herring Networks, Inc., started the One America News Network in 2013 to cater to a right-wing audience with political news and unabashedly pro-Trump stories and to compete with FNC. Various media watchers have criticized One America News Network for airing false stories and conspiracies as news.

Several international or foreign news entities also operate through U.S. cable or satellite broadcast systems or through streaming services. Although these are not major players in the U.S. cable news market, they do serve niche audiences. These include, for example, RT America, launched in the United States in 2010. Part of the Russian Federation's Russia Today news organ, RT America has been registered as a foreign agent in the United States since 2017. There are also several cable news offerings focusing on news from China and elsewhere in Asia. Lastly, there is BBC World News, which is not focused specifically on the United States but does have a bureau in Washington, DC. As the international arm of the British Broadcasting Service, this network is estimated to reach over 120 million viewers across the globe and to have some of the highest viewer trust ratings of any network in the United States.

C-SPAN and the Unfiltered or Minimally Filtered Alternative Among the Cable News Channels

The Cable Satellite Public Affairs Network, otherwise known as C-SPAN, offers the cable viewer a means of viewing congressional hearings, government agency hearings, some international coverage, and many other events directly and with no interpretation or filtering through news anchors or other on-air personalities. C-SPAN covers many of these hearings and events from start to finish. In 2019, an estimated 100 million-plus U.S. households had access to C-SPAN programming, and that number does not include the access provided through the network's affiliated radio, websites, and streaming services.

C-SPAN came to fruition in 1979 with the founding of the nonprofit, independent, and private National Cable Satellite Corporation. Although

the cable industry started the new network and retains seats on its board of directors, C-SPAN operates independently of both the cable industry and U.S. government. C-SPAN, which has three channels (C-SPAN 1, 2, and 3), carries no advertising, receives no federal funding, and does not solicit viewer contributions. C-SPAN is funded through a very low subscriber-based charge or fee paid by the cable companies and direct satellite broadcasters. Consistent with its emphasis on public affairs programming, the network also carries occasional shows about history as well as nonfiction book reviews. The network is headquartered in Washington, DC.

Although liberal and media watchdog organizations have occasionally criticized the network for a conservative bias in its selection of guests for panel discussions and for underrepresenting people of color, the network has also been credited with enhancing the state of the public's understanding of national affairs, for its educational value, and for its generally balanced, neutral coverage of government and public affairs.

Structural and Journalistic Concerns With 24-Hour Cable News Networks

Among the most common criticisms leveled at the cable news networks are the inevitable difficulties and programming imperatives associated with broadcasting 24 hours a day, every day. The cable news networks must constantly search for stories and report conflicts to keep viewers watching. One concern is the impact this relentless drumbeat of on-air coverage has on policymakers, politicians, and the public. Another concern reflects the apparent movement by some networks, shows, and hosts to promote conflict among guests and in society as a means of building ratings. Several networks have, by design or otherwise, moved toward the coverage of political conflict as a form of branding and entertainment with little regard for actual news reporting or without regard for setting clear boundaries between opinion or commentary and factual reporting of the news. As the line between advocacy and reporting grounded in fact and the principles of journalism continues to fade, critics fear the public's trust will fade as well.

CABLES, UNDERSEA

The first successful transatlantic telegraph cable (1866) transformed the global reporting of news, greatly speeding up the pace of transmission between Europe and North America. News that had taken weeks to travel by ship could now be sent in minutes or hours, making (as many noted both at the time and since) the world seem smaller. Development of the first transatlantic telephone cable (1956) added a new, albeit briefly very expensive, means of reporting. Today's fiber-optic cables span the Northern Hemisphere, putting most major cities within seconds of each other for transmission of audio, visual, and data news communication.

The idea of expanding beyond land telegraphy by laying a telegraph cable under water was delayed for years by two technical factors. The first was the search for an efficient means of insulating the cable from seawater, and the second

involved determining the correct amount of power to transmit a message over several thousand miles. A successful telegraph cable was laid under the English Channel in the early 1850s, greatly speeding news communication between London and Paris, but the far greater Atlantic distances delayed attempts there until late in the decade. An 1858 expedition did complete a cable, but it operated for only about a month before fading into silence, providing a fleeting and tantalizing example of what could be accomplished with such a connection. Though never determined for sure, the cable probably failed due to the excessive power used, which probably weakened the cable's insulation. The American Civil War (1861–1865) delayed renewed efforts until 1865, when another attempt failed, the cable breaking shortly before completion of the voyage. Finally, in 1866, a cable was successfully deployed, and soon many others followed across the Atlantic and other seas, including the Indian Ocean by 1870 and all the way to Hong Kong a few years later. British and American trans-Pacific cables entered service only in 1903, the long delay after the Atlantic cables owing to the great distances involved and relative lack of intermediate landing points. Political factors also played a part—the British wanted their empire communication routes based in and relying only on colonial posts where London could maintain control.

Each of the transoceanic telegraph cables was developed and operated by major telegraph companies, usually aided by a substantial government subsidy. That subsidy came with the requirement that government and military communications always took priority. Since there was no effective competition (surface ship transport could vary from 1 week to many, depending on distance), cable charges were at first very high (\$10 per word—well over 15 times that in early 21st-century values). Only with the development of multiple competing cables and slowly improving technology did costs begin to come down. By the late 1860s, the Associated Press (AP) was moving up to 35,000 words a day by cable. The inception of wireless telegraphy in the early 20th century, however, offered the first real competition to undersea cables. Even so, the AP was still spending upwards of half a million dollars a year on cable charges during World War I. The major powers

fighting in that war also censored all messages, news included, that moved by cable.

The high cost of using cables contributed to development of a world news cartel in the late 19th and early 20th centuries. Members of the cartel could share the high cost of cable transmission. The world's large news agencies—Reuters, Havas (France), Wolff (Germany), and the AP—largely carved up global regions of news dominance, and their cartel lasted into the 1930s. Shortwave radio offered a further degree of cable competition in the 1930s, though cables offered all-weather service that, owing to atmospheric interference,—radio transmission could not then match.

American Telephone & Telegraph's Bell Telephone Laboratories provided most of the research that underlay the first telephone cable (Trans-Atlantic or TAT-1) in 1956. Again, initial costs to use the facility were quite high, dropping only as more cables were laid, and especially after fiber-optic cables appeared in the 1980s, dramatically increasing the number of available circuits. Maps of the routes used by the world's hundreds of modern submarine cables, however, reveal an important limitation in news reporting: there are few cables serving Africa or South America, for example. Most Southern Hemisphere nations (Australia and New Zealand are exceptions) must communicate with the rest of the world by linking to the major Northern Hemisphere cable routes.

With the development of communication satellites in the 1960s and 1970s, undersea cables declined as essential modes of news transmission. Satellites provided greater capacity and could be designed and launched more rapidly than a cable could be constructed. With the arrival of fiber-optic cable in the 1980s, however, the tables slowly turned again, as the new cables now offered greater capacity and lower cost, as well as the option of repair. Increasingly, both modes—satellite and cable—are used to back up the other. News can now be transmitted worldwide in seconds, at a fraction of former costs.

Submarine telegraph cables were the first means of effective and nearly instantaneous global communications, first between Europe and North America, and slowly thereafter including the Middle East and eventually Asia. South America and Africa, however, have always been poorly served by

cables, forcing those regions to link with major cable lines in the Northern Hemisphere. The costs to use oceanic cables forced a spare reporting and writing style to place the most information into the fewest possible words. A cartel of the world's major news agencies controlled oceanic telegraph cable journalism for the first six decades of its use. Only with rising competition from wireless, then short-wave radio, and finally communication satellites, did cable rates drop. Fiber-optic cables have dominated the field since the early 1980s, providing huge capacity, and further lowering costs.

CARTOONISTS, POLITICAL

Political cartoonists have been a vital part of the United States' dialogue since the colonial period. Combining artistic skill, rhetorical exaggeration, and biting humor, cartoonists have a long tradition of questioning authority, drawing attention to corruption, and highlighting society's ills. In return, political cartoonists occasionally have been offered bribes, threatened with jail time, or

faced other forms of attempted coercion by those in power. Political cartoonists were particularly influential in the years following the American Civil War, thanks in large part to the brilliance of Thomas Nast, and their prominence continued through the first two decades of the 20th century. The profession experienced another creative surge in the 1960s and 1970s, reflecting a more adversarial mood in the country. In the 2000s, as financially struggling daily newspapers jettisoned dozens of full-time artists and became increasingly timid in courting controversy, political cartoonists often turned to the Internet and social media to distribute their work, pursue new creative possibilities for the art form, and stir outrage.

Elements of the Political Cartoon

A successful political cartoon, argues historian Edward Lordan, requires five elements: a receptive audience, a medium of distribution, an artist with a creative sense of humor, a powerful subject worthy of scorn, and a negative public perception of that subject. Historian Charles Press suggests that the artistic quality of the cartoon matters much less than the genuine feeling of indignation and outrage and adds that cartoons that stand the test of time deal with subjects that have lasting importance.

In terms of subject matter, cartoonists draw from four major sources, as identified by researchers Martin Medhurst and Michael DeSousa:

- political commonplaces, major recurring subthemes such as national defense and electoral machinery such as campaigning;
- literary or cultural allusions, references that draw from mythology, literature, or folklore;
- personal character traits, including morals, truthfulness, and ability to lead; and
- situational themes or transient episodes that occur during a campaign and are salient to the audience for a limited period of time, such as when a candidate makes a gaffe during a public speech.

How Political Cartoons Affect the Audience

Communication scholars gave increasing attention to political cartooning during the years

preceding World War II and continuing after the conflict, suspicious of imagery's role in propaganda. Many of these early studies asserted the power of the cartoon with little if any empirical evidence to support the finding. Later studies revealed the power of the political cartoon was not uniform across populations or media, suggesting that the intensity of preexisting audience attitudes about the subject was very important in caricature's effectiveness and that people with preexisting prejudices tended to misinterpret cartoons.

A burst of empirical scholarship beginning in the 1960s cast even more doubt on political cartoons' ability to convey a fixed meaning. A 1968 study in *Journalism Quarterly* found that no more than 22% of readers extracted the same meaning from the cartoon as the artist intended. Another study of cartoons before and after the Watergate scandal in the 1970s concluded that negative reactions to a caricature were related to topical themes of the cartoon and general popularity of the politician at the time. In summary, communication scholarship indicates that our understanding of how cartooning works is limited, and audience interpretations of political cartoons are dependent on a number of social, cultural, and idiosyncratic factors. Cartoons are much less likely to change minds than to reinforce preheld conceptions of those agreeing with the graphic message.

Early Development

The first popular political cartoon in the colonies is credited to Benjamin Franklin, who published "Join or Die" in his *Pennsylvania Gazette*. Often misinterpreted today as a call to rise up against British tyranny, it actually was published in 1754 to urge colonists to back England in the French and Indian War. "Join or Die" played off the superstition that if a dismembered snake was put back together before sundown, the snake would live again (see Figure 1). The image was appropriated by other publications for various purposes over the next 20-plus years, contributing to modern-day confusion over its original meaning.

While not yet a staple in newspapers because of technological limitations, the political cartoon made its impact on colonists through single broadsheets, such as Paul Revere's depiction of the

Figure 1 Join or Die

Boston Massacre in 1770. As political rhetoric, the drawing took liberties with numerous facts of the case—Revere omitted the clubs that some colonists carried, and he portrayed the slain multiracial Crispus Attucks as a white man. While political cartoons were relatively few in number during the revolution, their impact helped galvanize support against the British.

Cartooning in the New Nation

The political cartoon continued to be a weapon in the early years of the new American nation, the barbs now turned away from England and toward rival political parties who fueled their rancor through a partisan press and savage artistic attacks. Pro-Federalist cartoonists were particularly vicious following the election of Thomas Jefferson to the presidency in 1800, in some cases making direct references to reports that Jefferson had fathered a child with one of his slaves. In the 1830s, cartoonists attacked Andrew Jackson's populism, his attempts to acquire more power for the presidency, and his earthy manner.

The 1830s also brought an increase in the amount of political art available to the public. A more vigorous newspaper business, fueled by cheaper newsprint, faster presses, and a new emphasis on advertising, slowly opened more opportunities for cartoonists. In addition, prints

by Currier and Ives became focal points of many home decors. These sold-by-the-individual-copy posters included still-life portraits, holiday scenes, and, in the political realm, presidential candidates, the company making sure to skewer each candidate in order to maximize sales. The prints remained popular throughout the 19th century.

The election of Abraham Lincoln and the Civil War marked a substantial surge in political cartooning. Lincoln's height and unique features were easy targets for his political opponents, such as cartoonist Adalbert Volck who famously portrayed Lincoln signing the Emancipation Proclamation with the devil's ink while stomping on the U.S. Constitution. Lincoln and the Union cause were much more favorably presented by *Harper's Weekly* and its emerging star cartoonist, Thomas Nast, whom Lincoln reportedly called "our best recruiting sergeant." Nast not only produced patriotic cartoons to stir Union support but also attacked those who suggested anything other than unconditional surrender of the Confederacy, as in his "Compromise With the South," which pictured a confederate soldier shaking hands with a Union amputee while standing on the grave of another Union soldier.

Father of the American Political Cartoon

While Nast gained national notice during the Civil War, it was his work after the conflict that led many observers to call him the father of the American political cartoon. Nast is credited with creating many icons that have become part of the language of political life in the United States. For example, while the donkey had been loosely associated with the Democratic Party since Andrew Jackson ran for president in 1828, it was a Nast cartoon in 1874 that made the reference stick, while also placing the elephant as a symbol of the Republicans. In the "Third Term Panic," Nast responded to Democrats, most notably *New York Herald* editor James Gordon Bennett Jr., who decried a possible third presidential term by Ulysses S. Grant as "Ceasarism," or an attempt to give the president powers more resembling that of an emperor. Nast portrayed the *Herald* as "The Ass in the Lion's Skin" from Aesop's fables, a braying donkey to be mocked, not a menacing threat to be feared. An elephant labeled "The Republican Vote" stomped dangerously close to a

chasm in the chaos. By the 1880s, Democrats and Republicans had both incorporated the donkey and elephant into their respective campaigns, although the Democrats have never adopted the donkey as their official symbol.

It was Nast's work attacking the "Tweed Ring" that brought the cartoonist the most acclaim. William "Boss" Tweed became the leader of New York City's Tammany Hall political machine in the late 1860s and proceeded to bilk the city out of as much as \$20 million through fraudulent contracts, expense claims, and tax loopholes. Nast's caricatures of Boss Tweed emphasized his large nose, scraggly beard, and bloated body and made the ring's leader seem even more sinister than the charges against him suggested (see Figure 2). The series reached a wide

audience—*Harper's Weekly* claimed that readership tripled during the series—and Tweed himself reportedly said that the written attacks on him in newspapers were nothing compared to the impact of "those damn pictures." Nast took on Tammany despite intimidation tactics from Tweed associates and an alleged \$500,000 offer to stop the caricatures and leave the country. The legend surrounding Nast and the Tweed campaign grew to immense proportions by 1875, when Tweed escaped from jail and fled the continent. Legend has it that Tweed was arrested by Spanish customs officials, who recognized him from Nast's cartoons.

Emergence of the Comic Weekly

In the late 1800s, a new genre of magazine—the comic weekly—became home to a new style of political cartooning. Most notable of these publications was *Puck*, founded by Joseph Keppler, an immigrant from Vienna. In 1876, Keppler teamed with printer A. Schwarzmann to found a German-language *Puck*, then the following year the pair began publishing an English-language version of the magazine. After a difficult start, the English-language *Puck* reported a circulation of 80,000 within 5 years. *The Judge* and *Life* would later join *Puck* in this new style of cartooning.

Among the important innovations of *Puck* was color printing for periodicals. The style of Nast and those like him was in many ways dictated by wood engraving, the predominant technology of the day for producing cartoons for publication. The cartoonist carved his work into a wood block in order for it to be used on a press. Nast adapted this practice for artistic effect, his cross-hatching technique adding a striking appearance, but the process was laborious and time-consuming. The difficult technique of wood engraving made black-and-white simplicity a necessity.

Puck changed both the process and content of cartooning with its perfection of the color lithography process. Previously, lithographs had been rarely used in U.S. periodicals because of their expense and labor-intensive nature. Keppler began experimenting with color, first by adding a single tint over the black-and-white drawing on a second run through the press. By 1880, Keppler had adopted limestone to produce his lithographs

Figure 2 Thomas Nast and Boss Tweed

Source: Library of Congress Prints and Photographs Division, LC-USZ62-117137, <http://hdl.loc.gov/loc.pnp/cph.3c17137>

and was publishing vivid, full-color political cartoons on the cover, center spread, and back page. The process had become so famous and successful that *Puck* became an attraction at the 1893 World's Columbian Exposition in Chicago, IL, with thousands lining up to see the process and the innovator in person.

Puck's influence went well beyond printing technology, as the election cycle of 1884 demonstrated. Keppler and fellow cartoonist Bernhard Gillam published a series of 22 cartoons portraying Republican candidate James G. Blaine as a *Tattooed Man*, his body covered with tattoos of the various scandals with which he had been associated. The success of the series is indicated, in part, by the fact that numerous other publications began referring to Blaine as *Tattooed* in headlines and text during the campaign. Blaine reportedly considered suing *Puck* for libel but refrained in order to avoid more attention being brought to his alleged misdeeds.

A Golden Age of Newspaper Cartooning

The 1884 campaign also marked the beginning of a more robust period for political cartooning in daily newspapers. Most notable was a front-page cartoon in Joseph Pulitzer's *New York World* by Walt McDougall just before the election. McDougall's cartoon showed wealthy guests at a Blaine campaign dinner dining on "Lobby Pudding" and "Monopoly Soup" while a poor family begged for crumbs. The public reaction was crystallized as the *World* printed thousands of extras to satisfy the demand, and Democrats made large posters of the cartoon and put them on walls across New York City. Blaine lost the election to Grover Cleveland in one of the closest votes in U.S. history, and the power of the political cartoon was an often-cited reason for the final result.

The newspaper war between Pulitzer's *World* and William Randolph Hearst's *New York Journal* provided another spark for the rise of political cartooning in the 1890s and early 20th century. Upon buying the *Journal* in 1895, Hearst raided much of Pulitzer's best talent, including Richard Outcault and his popular "Yellow Kid" comic strip character. In the realm of political opinion, Hearst brought along Homer Davenport from his *The San Francisco Examiner* to attack

Republicans and their wealthy supporters. Davenport's most-noted subject for attack was Ohio senator Mark Hanna, who reportedly cried while showing one of Davenport's cartoons to a Senate colleague. Davenport later drew cartoons in support of Theodore Roosevelt for the *New York Evening Mail*.

A colleague of Davenport's at the *Journal*, former *Puck* cartoonist Frederick Burr Opper, also attacked the power of industrialists, skewering not only Hanna but also President William McKinley and "Papa," a character he created to represent the corporate trusts. Hearst papers throughout the country carried Opper's single-panel political cartoons, as well as his *Happy Hooligan* comic strip, making the artist a household name. By the 1930s, a straw poll of fellow cartoonists had deemed Opper the funniest man in newspaper history.

Newspapers throughout the country recognized the success of the Hearst cartoonists and responded by hiring more artists for their staffs, driving up demand and salaries for those in the comic arts. By one estimate, 2,000 editorial cartoonists had full-time positions at the beginning of the 20th century. This golden age of political cartooning did not go unnoticed by politicians, who grew weary of being caricatured. Some went as far as trying to outlaw cartooning, with five state legislatures considering measures between 1897 and 1915, and two states passing ill-fated laws. A California anti-cartoon law in 1899 banned cartoons that reflected on a person's character and required consent of the person being caricatured. The law was never enforced. Campaign cartoons against Pennsylvania gubernatorial candidate Samuel Pennypacker and his associates led to a state law against cartoon "libel" being passed after Pennypacker took office in 1903. Newspapers across the country roundly criticized the law, and it was repealed after Pennypacker left office in 1907.

Dissent During World War I

Cartooning drew the ire of government officials during World War I also, this time at the federal level. Most notably affected was the socialist magazine *The Masses*, edited by Max Eastman and featuring the work of cartoonists Art Young, Boardman Robinson, and Robert Minor. *The*

Masses, objecting to war no matter what the cause, produced images such as Minor's "At Last a Perfect Soldier!" depicting a military medical examiner's excitement over seeing a huge, muscular recruit with no head. Using the recently passed Espionage Act, the postmaster general declared the July 1917 issue unfit for mail delivery; *The Masses* challenged the Espionage Act in court but lost, ending the magazine's run. A number of individuals on the editorial staff were later tried individually under the Espionage Act, but the cases concluded with hung juries.

Dissent such as that displayed by *The Masses* was the exception rather than the norm during World War I, as the vast majority of cartoonists produced patriotic, pro-war work, whether in the spirit engendered by the government's Committee for Public Information propaganda arm, or coerced through the intimidation of the Espionage Act.

The prominence of political cartoonists began to shrink in the 1920s and 1930s. Daily newspapers embraced objectivity as an ideal and were less likely to follow party ideology, resulting in cartoons most often being relegated to an editorial page deep within the edition. The increasing influence of newspaper chains, continuing to swallow up newspapers across the country, put less importance on local issues, and corporate owners were more apt to send syndicated cartoons to its member papers than to hire local artists.

A few cartoonists stood out in the period between the two World Wars. Bucking a national trend, the cartoons of "Ding" Darling remained on the front page of the *Des Moines Register* for 50 years and also reached millions of other readers through syndication. The two-time Pulitzer Prize winner was a strong supporter of Woodrow Wilson's call against isolationism after World War I, but Darling's work later became less partisan, its humor gentle and prodding rather than harsh and cutting. John McCutcheon of the *Chicago Tribune* took a similar tone and generally promoted pro-business, anti-Franklin Roosevelt ideals. A progressive mood remained in a few quarters, including Edmund Duffy's attacks on the Ku Klux Klan in H. L. Mencken's *The Baltimore Sun*, and Rollin Kirby's skewering of Prohibition through his character "Mr. Dry" in the *New York World*.

Cartooning in World War II

World War II cartooning, and press coverage in general, featured even less dissent than that during World War I, due in part to the galvanizing influence of the Japanese attack on Pearl Harbor on December 7, 1941. A notable exception was the Black press, which posed uncomfortable questions about why African Americans were being asked to fight abroad when they did not have equal rights at home. In particular, the work of Oliver Harrington at the *Pittsburgh Courier* and republished in other Black newspapers drew attention to racism in the military. The criticism did not go unnoticed by J. Edgar Hoover, Director of the FBI, who repeatedly tried to shut down papers such as the *Courier* during the war, and who later would accumulate an extensive investigative file on Harrington.

The most popular cartoonist during World War II was an enlisted soldier. Bill Mauldin began drawing cartoons for the *45th Division News*, then moved to the military newspaper *Stars and Stripes* in 1943. Mauldin's dirty, tattered, war-weary infantrymen "Willie and Joe" depicted the conditions under which foot soldiers performed, and at the same time used sarcasm to needle those in the officer class. The former delighted the enlisted men and the public, while the latter raised the ire of military leaders, including Gen. George Patton, who threatened to ban *Stars and Stripes* from his Third Army unless "Willie and Joe" disappeared from its pages. Gen. Dwight Eisenhower rebuffed Patton, saying that Mauldin's work was a useful outlet for soldier frustrations. Thanks in part to a favorable article by famous war correspondent Ernie Pyle, "Willie and Joe" became available to newspapers across the country through United Feature Syndicate, and in 1945, Mauldin, at age 23, was awarded the Pulitzer Prize for Editorial Cartooning.

As a civilian, Mauldin would later win another Pulitzer Prize with the *St. Louis Post-Dispatch*, and he drew a memorable cartoon for the *Chicago Sun-Times* following the assassination of John F. Kennedy, depicting a crying statue of Abraham Lincoln at the Lincoln Memorial.

Responding to the Red Scare

The onset of the Cold War in the 1950s produced a chilling effect on many forms of communication,

as fears of Communism turned into paranoia over suspected subversives, not only in government but also in media. Sometimes with little proof, and rarely with a chance to face their accusers, numerous television and film actors, writers, and producers with alleged ties to left-leaning organizations were effectively banned from working through *blacklisting*. Congressional proceedings, such as those by the House Un-American Activities Committee (HUAC) led by Richard Nixon, sought to expose those who they deemed as being loyal to the Communist cause. At least one political cartoonist, Oliver Harrington, was investigated by HUAC. Harrington left the country for Europe, never to return. In this climate of fear, cartoonists generally avoided questioning whether constitutional rights were being circumvented in the name of security.

A few cartoonists were bold enough to criticize the tactics of those in the anti-Communist movement. Walt Kelly's *Pogo* strip skewered FBI Director Hoover and produced a character, Simple J. Malarky, as a parody of Sen. Joseph McCarthy, who was using his Senate Permanent Subcommittee on Investigations as a bully pulpit against alleged Communists. The most notable cartoonist to take on McCarthy was Herbert Block, better known as Herblock to readers of *The Washington Post*. It was Herblock who coined the term *McCarthyism*, using the junior senator from Wisconsin as a broader symbol for the Red Scare that had enveloped the country. In perhaps the most memorable Herblock cartoon from the period, he drew a man labeled "Hysteria" carrying a bucket of water up a ladder and yelling "Fire!" as he made his way to the flame at the top of the Statue of Liberty.

Herblock also took aim at Nixon in the 1950s, depicting the then-vice president crawling out of a sewer to campaign for fellow Republicans. For the next 20 years, Nixon became a recurring target for the cartoonist, who would win three Pulitzer Prizes in a career that spanned seven decades.

A Surge in the 1960s and 1970s

The social turmoil of the 1960s and the Watergate scandal of the 1970s marked a period of resurgence in the vitality of the profession, as cartoonists, and journalism overall, took a more adversarial stance.

Perhaps the most influential cartoonist of the period was a native Australian, Pat Oliphant, whose work always contained biting satire and often included a tiny penguin, Punk, who occupied the bottom corner and punctuated Oliphant's point with a sardonic comment. By the 1990s, Oliphant was the most-widely syndicated political cartoonist in the world, and *The New York Times* called him *the most influential editorial cartoonist now working*.

Paul Conrad spent three decades at the *Los Angeles Times*, winning three Pulitzer Prizes while taking aim at Presidents Ronald Reagan and Richard Nixon. Conrad ended up on Nixon's infamous "enemies list," a document prepared by the Nixon White House identifying perceived political opponents, and Conrad suspected that a series of tax audits were related to his attacks on the president.

Jeff MacNelly's conservative-leaning work at *The Richmond News Leader*, *Chicago Tribune*, and through syndication gained him national acclaim and three Pulitzer Prizes. MacNelly also created the popular comic strip *Shoe*, inspired by a journalism professor who mentored the cartoonist at the University of North Carolina at Chapel Hill.

While technically a comic strip, Garry Trudeau's *Doonesbury* won the Pulitzer Prize for Editorial Cartooning in 1975, underscoring Trudeau's influence in American political life. Although new *Doonesbury* strips became Sunday-only features in 2014, the series remained strong in the 21st century, being syndicated to more than 1,000 newspapers worldwide.

A Waning Influence

In the early 2000s, a handful of political cartoonists maintained the artistic competence and strident criticism established by their historical predecessors. Female cartoonists Signe Wilkinson and Ann Telnaes produced acclaimed work in what traditionally had been a male-dominated profession. Wilkinson's irreverent, left-leaning work was honored with a Pulitzer Prize in 1992, making her the first female to win the award for Editorial Cartooning. Telnaes's satirical commentary during the disputed Bush-Gore presidential election was recognized with the 2001 Pulitzer Prize. Other notable cartoonists of the period

included Mike Luckovich of *The Atlanta Journal-Constitution*, David Horsey of the *Seattle Post-Intelligencer*, Clay Bennett of *The Christian Science Monitor*, Joel Pett of the *Lexington Herald-Leader*, and Doug Marlette, who worked for several papers, including *The Charlotte Observer*.

On the whole, however, the profession was in deep decline in the new century. In a post-9/11 world, many newspaper editors and publishers were increasingly reluctant to publish cartoons that might be perceived as unpatriotic or critical of the war on terror. In the 2010s, as Americans increasingly disagreed over what constituted “offensive speech” and the electorate became ever more polarized, editors demanded cartoons “which do not express a strong opinion that some readers might disagree with,” in the opinion of cartoonist Daryl Cagle. As one example, Pulitzer Prize-nominated cartoonist Rob Rogers was let go from the *Pittsburgh Post-Gazette* in 2018 after a critical Donald Trump drawing that angered the paper’s conservative publisher. The following year, the international edition of *The New York Times* stopped publishing political cartoons altogether (and let go its two in-house cartoonists) after printing a syndicated caricature of Benjamin Netanyahu that was widely condemned for being anti-Semitic.

After the Great Recession, many newspapers suffered catastrophic staffing cuts, with cartoonists becoming increasingly expendable. In 2007, there were 84 full-time editorial cartoonists employed by U.S. newspapers; by 2019, they numbered 30. Perhaps reflective of the times, Mark Fiore’s self-syndicated work on SFGate.com garnered the Pulitzer Prize in 2010, the first time a cartoonist was honored without being a full-time staffer on a publication or part of a large national syndicate. Two years later, Matt Wuerker won the Pulitzer Prize while working for the primarily digital publication *Politico*.

Some cartoonists embraced these 21st-century challenges and produced innovative work that pushed conventional notions of the form. Michael Sloan, working in tandem with writer Jake Halpern, won the 2018 Pulitzer Prize for chronicling the true story of a refugee family in graphic narrative format in a series that was published by *The New York Times*. The following year, freelancer Darrin Bell’s work chronicling disenfranchised

populations and the Trump presidency won the Pulitzer Prize, the first time an African American received the honor.

CBS News

The beginnings of CBS date back to 1927, after the Columbia Phonograph Company and United Independent Broadcasters launched Columbia Phonograph Broadcasting System (CPBS). The *Phonograph* was soon dropped, resulting in the name Columbia Broadcasting System (CBS). The next year, young William Paley, who was the 27-year-old son of an owner of a Philadelphia cigar company, bought a controlling interest in CBS. One of his first signature accomplishments

running CBS was covering the presidential election in 1928 between Herbert Hoover and Alfred Smith. CBS announcer Ted Husing reported returns from the election, a first for the emerging radio industry. Paley helped develop the concept of option time, where the network would pay their affiliate radio stations \$50 per hour for an option on a portion of their airtime. CBS would provide the programs for the affiliates and then sold ad space or sponsorships. While NBC was charging their affiliates to carry its programming, more than 90 affiliates jumped ship over to CBS by 1933 with this new idea. CBS had 114 affiliates throughout the United States within 10 years. The Federal Communications Commission later outlawed the practice of option time in 1941. CBS created its news division in 1934 and hired Edward R. Murrow in 1935 to become its director of talks. After moving to London to become head of the CBS operations in Europe, he was thrust into news coverage after Germany invaded Austria in 1938. He flew to Vienna and covered the event. Soon after, he developed the European News Roundup, which was a network of foreign correspondents to help provide coverage of the war efforts overseas. Anchored by Robert Trout, it became popular and became a daily show. Murrow's fame rose while covering the war during World War II. His reports were from the rooftops rather than shelters so listeners could hear what was going on while he gave the reports. He became the first to incorporate natural sounds of the war into his broadcasts. This entry examines the development of television and several CBS programs including *CBS Evening News*, *Face the Nation*, *60 Minutes*, *48 Hours*, *CBS This Morning*, and *CBS Sunday Morning*. The entry also discusses CBS's streaming news network, CBSN. The entry closes with an overview of the corporate history of CBS.

Development of TV

Gilbert Seldes wrote an article in *The Atlantic* that claimed networks should experiment with television before advertisers would heavily get involved. Most Americans did not own TV sets and received their news either by radio or newspapers. CBS hired Seldes to assemble a crew and first got involved in broadcasting television news in 1941.

WCBW, which was an experimental television station in New York City (later named WCBS), broadcast a 15-min program called *Richard Hubbell and the News* from a studio built above Grand Central Station. That same year, the station provided the first television news instant special after the attack on Pearl Harbor on December 7, 1941. After World War II, Murrow hosted *See it Now*, which was a documentary news series on CBS. One of the most notable periods from the program includes Murrow's reports about Senator Joseph McCarthy, who publicly persecuted people who had leftist political agendas and deemed them communists. As a result, some people were unable to find work and were blacklisted. While many reporters shied away from taking on McCarthy, Murrow took him on directly with his reporting.

CBS Evening News

The nightly network newscast was originally developed in 1948 and was called *The CBS TV News*. The newscast lasted 15 min each night during the week and was anchored by radio veteran Douglas Edwards. Within a couple of years, the name changed to *Douglas Edwards with the News*. Edwards stayed in that role until 1962 and was replaced by Walter Cronkite. The show was then renamed *CBS Evening News with Walter Cronkite*.

The nightly newscast increased from 15 min to 30 min on September 2, 1963. The dedication to news got the attention of President John F. Kennedy, who gave an exclusive interview to Cronkite for its first expanded newscast. The expansion came just before President Kennedy was assassinated just a couple of months later. Over the next decade, newscasts included some of the biggest stories in U.S. history, including the civil rights movement, the war in Vietnam, and the first steps on the moon. Cronkite, who was called the most trusted man in America according to a 1972 poll, anchored the program until his resignation in 1981.

Dan Rather took over for Cronkite in 1981, starting a 24-year run as the network's lead anchor. Rather started with CBS as a correspondent in 1962 and covered crucial stories including the Kennedy assassination, the war in Vietnam, and the Watergate scandal. He had also served as

an anchor for the weekend newscasts and as a correspondent for *60 Minutes*. Rather left his role as anchor in 2005 after controversy over reports of President George W. Bush's record with the Texas Air National Guard. He stayed on as a correspondent and then left CBS in 2006 to become an anchor and managing editor of *Dan Rather Reports* on HDNet.

Immediately after Rather left the *CBS Evening News*, Bob Schieffer temporarily took over the anchor chair until Katie Couric took over on a permanent basis in 2006. She became the first solo female anchor of a nightly network newscast. Couric came to CBS after a lengthy run as morning anchor for *The Today Show* on NBC, becoming one of the most popular and highest-paid news personalities. The show struggled in the ratings and she left CBS in 2011. Scott Pelley took over for Couric in 2011, helping regain some of the viewers that had been lost. Pelley started with CBS as a reporter in 1989 and covered the Persian Gulf Crisis soon after. He had also worked as CBS' Chief White House Correspondent and extensively covered the 9/11 attacks. However, ratings began to suffer again and Pelley was fired in 2017. Pelley later claimed that he had been fired because he had complained to top executives about a hostile work environment. He became host of *60 Minutes* after losing the anchor chair. Pelley was replaced on an interim basis by Anthony Mason in June 2017 before the naming of Jeff Glor as the permanent replacement later that year. Glor joined the network in 2007 as a correspondent. He also served as a weekend anchor of the *CBS Evening News* and an anchor on *The Early Show*. Glor's role was short-lived after he was replaced by Norah O'Donnell in July 2019. The show moved its broadcast from New York City to Washington, DC, in December 2019.

Face the Nation

Face the Nation is the longest-running news program on CBS and one of the longest-running television programs in television history. It launched on November 7, 1954, with Bill Shadel as the host. Originally a 30-min program, the network expanded the show to an hour in April 2012. Rival programs such as *Meet the Press* on NBC and *This Week* on ABC lasted an hour, and CBS

wanted to capitalize on a growing viewership prior to the expansion. Bob Schieffer was the longest-running host of the show for 24 years between 1991 and 2015. Schieffer spent 46 years working for CBS before his retirement. He interviewed every president since Richard Nixon, and most recently before his retirement had interviewed President Obama three times on *Face the Nation*. Schieffer also moderated three different debates for the Presidential Commission of Debates in 2004, 2008, and 2012. Other moderators included Stuart Novins, Howard Smith, Paul Niven, Martin Agronsky, George Herman, Lesley Stahl, and John Dickerson. Most recently, Margaret Brennan took over the program in 2018. She had been with CBS since 2012 as a correspondent and had also filled in on *CBS This Morning* and the *CBS Evening News*. Brennan had also filled in as a substitute moderator for the show after Dickerson left the show. *Face the Nation* ended the 2019–2020 television season as the most-watched Sunday morning public affairs show, having grown its audience by 6% from the previous year.

60 Minutes

60 Minutes was created by Don Howard and debuted on September 24, 1968. It is considered the first of the TV newsmagazines, which offer in-depth reporting on a range of subjects. Howard wanted to create a sort of *Life* magazine for television that had a similar mix of serious and light stories. The first anchors were Harry Reasoner and Mike Wallace. Reasoner was a veteran broadcaster for CBS, while Wallace offered the program more of a hard edge with tough questions. Throughout the years, the ensemble of reporters provided the network award-winning storytelling that achieved numerous accolades. CBS considers it the most successful broadcast in television history. The program has won more Emmy Awards than any other prime-time broadcast.

48 Hours

Howard Stringer, who was a former president of CBS News, created *48 Hours* in 1987. The documentary/investigative series uses an in-depth approach to cover news. It originally focused on events occurring within a 48-hour time span.

However, that approach was eventually phased out. The program's efforts have resulted in three Peabody Awards, 21 Emmys, six RTNDA Edward R. Murrow Awards, and two Alfred I. duPont-Columbia Awards for its reporting. Rather hosted the program for the first 14 years. Since then, the show featured numerous other hosts including Lesley Stahl, Peter Van Sant, and Erin Moriarty.

CBS This Morning

CBS has not had as much success with morning shows as NBC and ABC have had. *CBS This Morning* debuted in 1987 but had difficulties keeping up with *Good Morning America* and *The Today Show*. On November 1, 1999, the show was replaced by *The Early Show* with anchors Bryant Gumbel and Jane Clayson. Gumbel was an intriguing choice, who had vowed never to return to mornings after spending 15 years on *The Today Show*. The program went back to its original name of *CBS This Morning* in 2012 with hosts Charlie Rose, Gayle King, and Erica Hill. Since then, it has struggled to keep up, remaining in third place as of 2020.

CBS Sunday Morning

The network launched *CBS Sunday Morning* on January 28, 1979, with Charles Kuralt as its lead anchor. Kuralt was a veteran journalist, reporting "On the Road" segments for the *CBS Evening News* between 1967 and 1980. The stories showcased a lighter storytelling ability that found stories off the beaten path that would otherwise have gone unreported. Kuralt held the position until 1994, when Charles Osgood took over as the anchor. Osgood held the role until stepping down in 2016 and was replaced by Jane Pauley. In 2019, the show celebrated its 16th consecutive season as the most-watched Sunday morning news program.

CBSN

CBS Corp. CEO Leslie Moonves confirmed a months-long rumor in May 2014 that CBS was looking at starting a 24-hour streaming news network. He mentioned to Bloomberg the prospects of a 24-hour digital channel that could be streamed around the world. As a result, CBSN started on

November 6, 2014. The plan was to air live, anchored coverage between 9 a.m. and midnight (ET) during the week. It later shifted to the hours between 5 a.m. and 10 p.m. (ET). During breaking news situations, the channel could either take the CBS News coverage or offer their own. As of 2021, the channel rebroadcasts programming such as *CBS This Morning* and *Face The Nation*. It also offers original programming, such as *Red & Blue*, which is a current affairs show that airs daily. It also airs original stories called CBSN Originals. The channel allowed viewers to skip around through coverage as well, creating an on-demand feature in case people wanted to see segments or coverage that had already aired. The network is available on the CBS website, CBS mobile apps, Roku, Amazon Fire TV, and Hulu. Access to the channel is free, which differentiates it from channels of cable news counterparts where viewers need to subscribe to a service in order to view their live channel. CBSN experienced significant growth in its first few years. It had a 38% year-over-year increase in streams in the second quarter of 2017. In August 2018, the network unveiled CBSN Local to target local audiences. It started with New York at the end of 2018 and later expanded to Los Angeles, Boston, San Francisco, Minneapolis, Philadelphia, Denver, Pittsburgh, Chicago, and Dallas-Ft. Worth in 2019 and 2020. Modeled after CBSN, programming included livestreams of regular local newscasts and other original programming for each market.

Corporate History

The corporate name for CBS was Columbia Broadcasting System until 1974, when it was renamed CBS Inc. The company successfully staved off a hostile takeover attempt by CNN and WTBS owner Ted Turner in 1985. CBS Inc. spent approximately \$1 billion to buy back some of its own stock to substantially drive up the cost of purchasing the company. The company also sold much of its book, magazine, and record business during that same period in order to focus solely on radio and television broadcasting. After a consistent downward trend in overall network ratings, CBS Inc. was sold to Westinghouse Electric Corporation in 1995. The \$5.4 billion merger, which included 15 television stations and 39 radio stations, reached approximately 35% of all

households in the United States. Westinghouse Electric Corp. was based in Pittsburgh but moved its corporate headquarters to New York City 2 years after the merger. It also changed its name to CBS Corp., dropping the Westinghouse name in order to focus on its media empire. The company further invested \$9 billion to acquire television and radio stations while selling off its industrial assets. CBS Corp. merged with Viacom in April 2000, making it the largest media merger at the time at \$44 billion. It was the second-largest media company at the time behind Time Warner. The partnership allowed the prestigious CBS network to form a synergistic relationship with Viacom's extensive cable empire, which included MTV, VH1, and Nickelodeon. The company split in 2006, with CBS Corporation and Viacom going their separate ways. However, talks of reuniting came back up again in 2016. CBS Corp. Chairman Leslie Moonves was against a merger. After Moonves left the company due to sexual misconduct allegations, merger talks picked back up again, and the deal was completed on December 4, 2019. The new company was named ViacomCBS with a total market capitalization of \$26 billion.

CELEBRITY AND FAN MEDIA

Celebrity and fan media feature stories about the personal lives of show business and sports celebrities, often including fashion coverage and especially seeking scandal. They are for-profit magazines or online venues intended for the amusement of fans of the popular culture subject matter that they cover. They are sometimes known as gossip magazines or websites. The people who write for these publications often have backgrounds and experience in mainstream journalism.

These magazines differ from industry trade magazines, such as *Entertainment Weekly*, fashion magazines that may feature celebrities on their covers such as *Vogue*, *Elle*, or *Glamour*, and the broader home design and lifestyle magazines such as *In Style*, *Vanity Fair*, or *Town & Country* that often feature celebrity homes and interviews, as well as other types of sports, travel, and leisure

publications. They can also be distinguished from literary magazines by the target audience of their content and from amateur fanzines by their professional, for-profit nature. The magazines and related media in this genre help to perpetuate a fan subculture that is maintained through familiarity and shared recognition of the details of the celebrities' lives that are reported. Most celebrity magazines have website counterparts.

Within journalism, celebrity and fan media are often considered less legitimate and prestigious than news and public affairs publications because they are produced for leisure enjoyment and consumption and employ different standards and tactics for information gathering, but they remain a profitable business. They may also serve to boost, maintain, or undermine the star status of the celebrities they cover. This entry discusses the nature of celebrity, celebrity magazines, the business of obtaining celebrity photos, and legal issues around celebrity and fan media.

Celebrity and Fame

Sociologist Leo Lowenthal argued that between 1901 and 1941, biographies in popular magazines underwent a striking change. Whereas earlier biographies of American society's heroes featured "idols of production"—they stemmed from the productive life of business, industry, and natural science—newer magazine heroes being featured were "idols of consumption"—they were directly or indirectly related to the sphere of leisure time and the worlds of entertainment and sports. What Lowenthal was describing was the shift in popular interest to the modern-day celebrity.

Other scholars believe that the development of visual technology was significant in fostering celebrity. As photography lent new importance to the representation of the individual and was increasingly employed in print media, the "dissemination of the face," writes researcher Joshua Gamson, displaced the dissemination of ideas, laying the ground for the "publicizing of people."

Fame is rarely achieved without assistance from partner industries and journalists often play a significant role. The companies and brands for which celebrities work, and not just the celebrities themselves, are responsible for creating and perpetuating the celebrity frenzy. A multifaceted process

undertaken by the celebrity industry contributes to fame. As researcher Barbie Zelizer has observed, stardom today is largely the result of advances in mass media technology and emerges from publicity activities coupled with repeated and routinized mass media appearances. These technologies and activities have made possible the extension of celebrity status to different kinds of public actors such as heiresses and socialites. The broadening of the term "celebrity" is perpetuated by an elaborate industry for public discourse exemplified not only by magazines but by television shows such as *Entertainment Tonight*, *Access Hollywood*, *Showbiz Tonight*, the E! television channel, reality television programs, and websites such as TMZ, POPSUGAR, and PerezHilton, which regularly engage in commentary and criticism about these figures' professional and nonprofessional activities.

The success of any given celebrity depends on the celebrity and media industries and on audience response. This last factor is vital to creating stars. People's social networks aid the dissemination of celebrity gossip and news. Industry production and distribution networks also circulate newsworthy items in hopes of increasing a celebrity's profile. From the beginning fame has required publicity, but celebrities are usually complicit in building up their own fame. As researcher Leo Braudy (1997, p. 5) wrote "societies always generate a number of people willing and eager to live at least part of their lives in the public eye."

Celebrities sacrifice personal privacy as part of the price they pay for their success and fame. While celebrities themselves may not always take action to publicize their personal activities, they rarely shy away from coverage. If personal activity captured on film makes the celebrity look good and more likable to audiences, then the information that has become public is usually deemed acceptable. But even negative notoriety contributes to fame.

The positive notoriety celebrities garner enables them to make endorsement deals for products and events, while negative notoriety can impede celebrities' ability to make these deals and even cause endorsement deals to be withdrawn. These lucrative arrangements make it easier to understand why celebrities are often willing to tolerate the inconvenience of photographers' constant

presence in their lives. In this way, celebrity can be seen as a cultural commodity whose economic value is based on potential exchange of fame for sales.

Popular Celebrity Magazines

American celebrity gossip magazines include *Us Weekly*, founded in 1977 by The New York Times Company, and acquired by Wenner Media in 1986. Since 2017, it has been owned by American Media, LLC, which also owns other celebrity magazines including *Life & Style*, *InTouch*, and *OK!*. As of 2019, the *Us Weekly* website averaged 27 million unique visitors monthly. As of 2017, its print magazine had a paid circulation of more than 1.95 million copies weekly. The magazine features a different style from its original format when it was a monthly industry news and review magazine. It switched format in 2000 to a celebrity news focus.

InTouch was launched in 2002 by Bauer Publishing. Its sister publication, *Life & Style*, launched in 2004. *OK!* and *Hello!* are both British celebrity magazines that became popular in the United States. *OK!* was originally launched as a monthly in 1993 by Northern and Shell and went weekly in 1996. In 2005, a U.S. version was launched. *Hello!* was launched in 1988 by Spanish publisher Eduardo Sánchez Junco. *Star* magazine, formerly published by American Media, Inc., was transformed from tabloid to glossy magazine in 2004, but folded in October 2018.

The content found in these magazines looks remarkably similar. Oftentimes, a week's issues of competing magazines will contain the same or very similar photographs and feature stories, almost as if these rival magazines' pages were interchangeable. The subjects of these celebrity magazines' stories and photographs are ordinarily stars' budding romances, breakups, wardrobe choices, scuttles with rivals, outings with their children, multimillion-dollar home purchases and sales, vacations, sightings on-location at movie shoots, arrests, and other heart-warming, tragic, and embarrassing moments. Articles in these magazines are usually no longer than two pages, and sometimes as short as a few paragraphs. The focus is as much on the photographs as it is on the text. Examples of these magazine features are *Us Weekly*'s "Just Like Us!"

which provides photographs of celebrities captured doing everyday things that the average person might do (such as riding bikes or getting coffee at Starbucks), "Who Wore It Best?" a side-by-side comparison of celebrities photographed in the same outfit, and "Red Carpet Style," another comparison of celebrity fashions worn at premiere events.

People magazine, a Time Inc. publication, started in 1974 as a spin-off from the "People" page in *Time* magazine and began as a human interest magazine, but by the 1990s, it was largely focused on celebrity content. By 2018, it had a total average circulation of over 3.4 million. *People* contains features such as "Star Tracks," brief updates on where celebrities have been seen out and about or en route to an event; "Style Watch," a feature similar to "Who Wore It Best?" and "Red Carpet Style"; and "Passages," a section containing brief updates on marriages, divorces, births, deaths, and legal matters of celebrities.

In addition to subscriptions that offer bundled issues of the magazine for substantially less, these half dozen titles are sold at newsstands for between \$5.99 and \$7.99 per single issue.

As of 2000, celebrity gossip was one of the fastest growing sectors of the magazine world, and celebrity magazine titles continued to set the sales standard for the industry through 2007. But by 2008, celebrity gossip magazines suffered downturns. Single-copy newsstand sales were declining although website traffic has increased.

Today's fan media, including magazines, bear some resemblance to the movie and radio fan magazines of the 1930s and 1940s. The rise of the fan magazine phenomenon coincided with the rise of the Hollywood star system, but fan magazines were most widely distributed in the heyday of the studio system, that is, from 1920 to 1950. The first issue of the first magazine, *The Motion Picture Story Magazine*, came out in February 1911, and the most popular fan magazine, *Photoplay*, claimed in 1922 that it had about 2 million readers. These publications functioned often as the voice of the studios' public relations people, though they were not published by the studios' PR departments.

Like the celebrity magazines of today, an important part of the content of fan magazines of the 1930s through the 1950s were articles about

the lives of the stars outside the studios and various gossip columns containing rumors and details about their private lives. Second, and almost as important, the magazines included extensively illustrated fashion articles, connecting films and film stars with female readers. Either the female stars posed in the dresses they had worn or were about to wear in their newest film, or they posed in their “private” wardrobe, thus illustrating the latest fashions. In addition to the glamorous photographs, the readers could obtain information on how to make the clothes themselves or where to buy patterns to sew dresses that looked like the ones worn by the stars—on and off screen.

Like today’s celebrity magazines, fan magazines of the 1930s through the 1950s functioned as mediators between Hollywood and the cinema audience. They built up interest in advance for new films to be released and they helped maintain film fandom.

Paparazzi and Celebrity Photos

Celebrity and fan magazines fill their pages with photographs of celebrity subjects. The popular interest in celebrities that these magazines cater to and perpetuate has given rise to paparazzi. Paparazzi are photographers who chase celebrities, public figures, and their families for the opportunity to photograph them in candid moments. The term *paparazzi* was coined in 1961, from the Italian word *paparazzo*, which was the surname of the freelance photographer in Federico Fellini’s 1959 film *La Dolce Vita*. As cultures’ interest in celebrity photos grows, so do the prices magazines will pay paparazzi for the photos, and the risks paparazzi will take to obtain them.

In 2000, paparazzi infamously flew over the backyard wedding of Jennifer Aniston and Brad Pitt in helicopters in attempts to snap aerial photos of the nuptials, while wedding guests had been asked to sign “no photographs” contracts. Since the early 2000s, however, when an exclusive photo of a celebrity could earn a photographer \$5,000 or more, the industry has reportedly been on the decline, in part because of the ability of stars to share their own photos on social media.

Sometimes, celebrities go to great lengths to evade the paparazzi. On occasion, to preempt the paparazzi frenzy that is expected upon a

celebrity’s major life event, such as a wedding or birth of a child, celebrities will enter into agreements with celebrity magazines to provide them exclusive photographs of their private life events at enormous prices. Many ethical, legal, and privacy issues arise out of this business.

Legal Issues

When violations of exclusive photo or story deals between celebrities and fan magazines occur, or when celebrities believe a fan magazine is guilty of libel, lawsuits often result. Since celebrities are public figures, and magazines are usually able to provide a source for the claims made in their stories, allegations of libel are difficult to prove. In order for a celebrity’s claim against a magazine to be successful, it must be proved that the publication acted with actual malice, that is, with knowledge that what it was publishing was false or with reckless disregard as to whether it was false or not.

Legally, in order to take a photo of a celebrity without his or her consent, paparazzi must get the celebrity out in public, away from a private residence or business. If the star is in a private area, the photo must be taken discreetly from a distance and with the photographer standing on public land. In more extreme cases, some paparazzi have taken photographs from rooftops or treetops using special camera lenses. They have shot private events from helicopters or boats.

In some cases, if the event is in a private building, paparazzi have staged fire alarms or bomb threats to cause the evacuation of the building, forcing their subjects onto the streets. In 2008, members of the paparazzi reported a fake fire at actress Maggie Gyllenhaal’s apartment block—just so the new mom would come out into the street with her baby. These tactics are not legal, but legal expenses have become part of operating costs for paparazzi and media organizations that buy their images, and have contributed significantly to the high price tag on such photographs.

Anti-paparazzi legislation has been enacted in several countries. France has very strict anti-paparazzi legislation. In the United States, California passed anti-paparazzi legislation after the 1997 death of Princess Diana in a car crash in Paris, which many critics blamed on the extreme

tactics used by French paparazzi. That event caused many governments to reexamine their paparazzi laws. The controversy surrounding anti-paparazzi legislation revolves around the question of where to draw the line between legitimate newsgathering and invasions of privacy.

Celebrities have used traditional legal protections in response to claims of abuse by the media. For example, in 1999, two photographers were convicted and received fines and jail time for following and blocking a car driven by Arnold Schwarzenegger in which his then-wife and at least one of his children were passengers. A freelance journalist who taped a phone call from Nicole Kidman to her then-husband, actor Tom Cruise, and then sold it to a tabloid newspaper pleaded guilty to a federal wiretapping charge and was sentenced to 6 months in a halfway house, fined, and ordered to do community service.

After the death of Princess Diana in 1997, and lobbying by a coalition of celebrities, the Screen Actors Guild, and victims' rights groups, four separate anti-paparazzi bills were introduced into Congress in 1998. Although the federal bills died in Congress, the nation's first anti-paparazzi law went into effect in California on January 1, 1999, creating tort liability for "physical" and "constructive" invasions of privacy through photographing, videotaping, or recording a person engaging in a "personal or familial activity." Under the statute, a person may sue for "physical invasion of privacy" when three elements are met: first, a person has knowingly entered the property of another without permission; second, the entry was made with the "intent to capture any type of visual image, sound recording, or other physical impression" of another person engaging in a "personal or familial activity"; and third, the invasion was made "in a manner that is offensive to a reasonable person." Communications law attorney Randall Boese warned the legislation may not withstand constitutional scrutiny over time and could lead to a chilling effect in photojournalism.

In 2016, Gawker Media declared bankruptcy, had its properties auctioned off, and its flagship Gawker celebrity gossip website closed down, after losing an invasion of privacy lawsuit brought by celebrity wrestler Hulk Hogan. Hogan's lawsuit was funded by billionaire tech investor Peter

Thiel, who backed several legal cases against Gawker, which had published a 2007 post outing him as gay. The suit was filed after Gawker published a video of Hogan having sex—without the permission of either Hogan or his partner. A Florida jury awarded Hogan \$140 million in damages. The judgment against Gawker was also intended to send a message to other celebrity gossip publications.

CENSORSHIP

Censorship as defined in the United States refers to the government's prior restriction, limitation, or filtering of information or ideas in speech and various forms of mass media, such as newspapers and broadcasting and other electronic media, including the Internet. The framers of the U.S. Constitution reacted to British sedition, criminal libel, and blasphemy law. The common law interpretation that there shall be no prior restraints, however, left centuries of American interpretation.

Historically, censorship has been a valuable tool for repressive forms of totalitarian government that do not value or allow freedom of speech, expression, or religion, let alone free news media. Under such conditions, draconian censorship often follows a desire to control the public. For example, a government official or agency may have responsibility for reviewing and altering media content prior to publication. In the common law English tradition of making law through judicial decisions, as well as the United States constitutional First Amendment framework, freedom of expression typically begins with the idea that there shall be no prior restraint on speech or press, but transgressions—such as defamation of character—may be subject to subsequent punishment. English jurist William Blackstone summarized the law in his *Commentaries on the Law of England* (1769), which received wide attention in colonial America.

Basic Concepts

Censorship is traditionally of two types. *Prior restraint*—the prevention of an idea being expressed—is the most typical, but *postpublication punishment* can have the same essential “chilling” effect on the free expression of ideas. Because of the wording of the First Amendment (1791) to the U.S. Constitution (“Congress shall make no law . . .”), in the American legal system, censorship nearly always means *government*, not private, actions taken to limit expression.

The classic faith in a marketplace of ideas began with English poet and essayist John Milton's view in *Areopagitica* (1644), which favored a test of competing ideas: “Though all the winds of doctrine were let loose to play upon the earth, so Truth be in the field, we do injuriously by licensing and prohibiting to misdoubt her strength. Let her and Falsehood grapple; who ever knew Truth put to the worse in a free and open encounter?” In essence, Milton's theory is that an open marketplace of ideas, including false ones, favors a steady movement toward correction over time.

In this vein, Blackstone's *Commentaries* summarized common law precedent through cases of an opposition to prior restraints, which are considered government actions that hinder communication by stopping it before publication: “Every freeman has an undoubted right to lay what sentiments he pleases before the public . . . but if he publishes what is improper, mischievous, or illegal, he must take the consequences for his own temerity.” The founding of the United States brought over time a series of legislative tendencies, particularly in time of war, toward enacting restrictions on free expression, mostly subsequent punishments rather than prior restraints, and this was supported by decisions of various courts. Restriction of free expression also has been rationalized on the basis of morality under the guise of protection of communities from obscenity, which has no legal protection.

Political Fears

Freedom of expression and press may contract during times of national and political stress. In the summer of 1798, Alexander Hamilton fueled division by calling Thomas Jefferson's supporters “more Frenchman than Americans,” charging them

with a desire to “immolate the independence” of the new nation “at the shrine of France.” President John Adams prepared for an attack by France and convinced a Federalist congressional majority to pass four laws including the Naturalization Act that extended residence from 5 to 14 years to become a citizen; the Alien Enemies Act targeting alien deportation; and the Sedition Act that attempted to censor political opponents. The Alien and Sedition Acts (1798) passed by the Federalists aimed to restrict publication of opposing political speech, but its pernicious reach restricted protesters, lawmakers, immigrants and also led to deportation of critics. Anyone charged with writing, printing, or speaking “any false, scandalous, and malicious writing” could be fined or imprisoned, such as some of about 26 Republican newspaper editors nabbed under the law. For example, Matthew Lyon, an elected representative from Vermont, was a critic of President John Adams and his “unbounded thirst, “ridiculous pomp,” as well as “foolish adulation.” He was indicted for publishing letters during his campaign with an “intent and design” of defaming Adams and his administration. Lyon was reelected while serving 4 months in prison, along with a \$1,000 fine. Jeffersonians and the Democratic-Republican party had the political support of Irish immigrants and favored states’ rights. Journalist James Callender also was sentenced to 9 months and wrote letters from jail during Jefferson’s 1800 presidential campaign. All of these acts were repealed or expired by 1802 except for the Alien Enemies Act that remained and was amended in 1918 to add women to its language.

Modern First Amendment cases may be guided by any number of legal tests. A common law approach adopted by early 20th-century courts was to allow subsequent punishment of any speech that had a bad tendency. *Patterson v. Colorado* (1907), for example, upheld criminal libel laws that limited press attacks on government that might incite public disturbances. A few years later, the U.S. Supreme Court in *Schenck v. United States* (1919) offered what amounted to a “clear and present danger” test—one that suggested restricting only that speech that presented a serious and immediate danger to public safety. The Court also has attempted a “balancing” approach to, for example, weigh the rights of adults to access media against the need to protect children.

For those wishing to truly protect First Amendment rights, a strict scrutiny approach—one in which the burden falls to the government to show a compelling reason for the regulation—works best. Under such a test, “narrowly tailored” restrictions may be upheld, as in *Board of Trustees of State of N.Y. v. Fox* (1989).

The scrutiny approach was perhaps most helpfully defined in what has been labeled intermediate scrutiny in the *O’Brien* (1967) case. Scrutiny would require a court to ask four pivotal questions about any attempt to limit media news coverage:

1. Is the government regulation within its constitutional power?
2. Does the regulation further an important or substantial government interest?
3. Is the interest unrelated to the suppression of free expression?
4. Is the incidental restriction of free expression no greater than is essential to the furtherance of the stated government interest?

Use of this four-part test means that it is very difficult for the government to justify restricting speech. Therefore, a court could only uphold those government restrictions that are not targeted at stopping speech. For example, it would be legal to speak out against a war but not violate laws aimed at preventing obstruction of it. Further, any law under this analysis would need to be limited to its goals and no broader than needed to further them. The Federal Trade Commission has used commercial speech law to regulate speech advertising illegal products or services, as well as deceptive messages that attempt to manipulate audience members.

Censoring the Movies

For much of the 20th century, for example, numerous states and communities employed censors to review movies before allowing them to be shown in a theater. In *Times Film Corp. v. Chicago* (1961), the U.S. Supreme Court refused to overturn a municipal code that required submission of all motion pictures for review before public showing. The Chicago board during the late 1950s would not issue a permit for the film *Don Juan*

without prior examination by censors. While motion pictures have long been included “within the free speech and free press guaranty of the First and Fourteenth Amendments,” as stated in *Joseph Burstyn, Inc., v. Wilson* in 1952, the *Times Film Corp.* court ruled that “[i]t is not for this Court to limit the State in its selection of the remedy it deems most effective to cope with such a problem, absent, of course, a showing of unreasonable strictures on individual liberty resulting from its application in particular circumstances.” The split decision left Chief Justice Earl Warren writing for four dissenters: “To me, this case clearly presents the question of our approval of unlimited censorship of motion pictures before exhibition through a system of administrative licensing.” In *Freedman v. Maryland* (1965), the Court struck down state law requiring unconstitutional submission of films to a government review board before showing them. The film board era in many states ended soon after and was replaced in 1968 by a voluntary Motion Picture Association of America rating system. From this point forward, prosecutors used criminal obscenity laws to charge people selling or showing obscene media content.

Despite the First Amendment’s stricture that “Congress shall make no law,” the Supreme Court has never found freedom of speech to be absolute. The classic expression about prior restraint came in *Near v. Minnesota* (1931), when the Court upheld the common law conclusion of Blackstone that generally there shall be no prior restraints on publication. However, the Court recognized what it termed “exceptional cases”: the need to protect fighting forces when a nation is at war, “the primary requirements of decency” to restrict obscene publications, and “security of the community life” from “acts of violence” all allow for government intervention. Likewise, in *Chaplinsky v. New Hampshire* (1942), a statute was upheld that read, “No person shall address any offensive, derisive or annoying word to any other person who is lawfully in any street or other public place, nor call him by any offensive or derisive name, nor make any noise or exclamation in his presence and hearing with intent to deride, offend or annoy him, or to prevent him from pursuing his lawful business or occupation.” The court concluded that “[t]here are certain well-defined and narrowly limited classes of speech, the prevention and punishment

of which have never been thought to raise any Constitutional problem: These include the lewd and obscene, the profane, the libelous, and the insulting or ‘fighting’ words—those which by their very utterance inflict injury or tend to incite an immediate breach of the peace.” Thus, near the Rochester City Hall, the case determined that it was unlawful to say the following offending words in the face of another: “You are a God damned racketeer” and “a damned Fascist and the whole government of Rochester are Fascists or agents of Fascists.”

Journalism, Access, and Censorship

Censorship frequently is a problem for journalists attempting to aggressively report news. The watchdog model of press coverage may place reporters in an adversarial stance with their sources in government. State public record laws and the federal Freedom of Information Act provide journalists (and others) with mechanisms for seeking and obtaining the records vital to much investigative journalism. Typically, such laws establish a time frame and reasonable costs for copying documents. However, material that is classified for national security reasons, personnel records, and other internal agency working documents are among the several exceptions to public records laws.

News reporters also need access to public meetings in order to be the eyes and ears of the general public. Open meetings laws, sometimes called *sunshine laws*, seek to keep public officials from conducting their business in secret. State public meetings laws generally require elected public officials conducting official business to vote and take other action in open meetings available to the public and press.

Reporters sometimes grant people who serve as sources of information a promise of confidentiality because public employees may lose their jobs for leaking information to the press. “Whistle-blower” laws may protect those who disclose illegal, immoral, or inefficient government practices. At the same time, reporters in some states are protected by shield laws that grant at least a qualified right to protect news sources from court subpoena. At the federal level, bills in 2007–2008 failed to receive approval that would protect

reporters refusing to disclose a confidential source. Courts have concluded that reporter privilege, or a right to protect sources, is qualified and not absolute. In *Branzburg v. Hayes* (1972), the Supreme Court ruled that the First Amendment does not protect journalists from appearing before a grand jury to provide secret testimony. Some news reporters have gone to jail when refusing to break a promise of confidentiality to an anonymous source when asked to do so by a judge or grand jury. Judith Miller, as a reporter for *The New York Times*, spent more than 80 days in jail in 2005 for refusing to disclose a source. Law enforcement, too, may seek to compel journalists to provide information during the course of a criminal investigation. In 2006–2007, for example, blogger Joshua Wolf spent a record 226 days jailed for refusing to give a federal grand jury in California videotapes he had recorded during a demonstration in 2005 in San Francisco.

Another area of concern is the courtroom. The right of a free press (the First Amendment) must be balanced against the right of a defendant to have a “speedy and public” trial (Sixth Amendment). Judges have sought to close courtrooms or issue gag orders to silence the press during the pretrial phase of a sensational case. However, the Supreme Court spoke plainly in the *Nebraska Press Assn. v. Stuart* (1976) case: “A prior restraint . . . has an immediate and irreversible sanction. If it can be said that a threat of criminal or civil sanctions after publication ‘chills’ speech, prior restraint ‘freezes’ it at least for the time.”

While most state and local courtrooms in the United States are now open to both broadcast and print journalists, broadcasters are barred from using audio and video equipment in federal court. Laws vary from state to state, and they frequently allow a trial court judge to decide whether or not broadcasting will be disruptive to the fair administration of justice.

Broadcasting and Scarcity

In broadcasting, stations are licensed by the Federal Communications Commission to serve in what the Communications Act of 1934 calls “the public interest, convenience or necessity.” To the extent that common law cases eventually shunned the notion of licensing (e.g., printers in England),

broadcast regulation was a departure from the principle that licensing can be viewed as a mechanism of censorship and a vehicle for enforcing prior restraints. Section 326 prohibits censorship of broadcasters, but the licensing process may be seen as a restriction.

In *NBC v. United States* (1943), the Supreme Court treated broadcasting as a medium that uses the scarce spectrum resource as having a fiduciary responsibility to serve the public interest:

The licensee has the duty of determining what programs shall be broadcast over his station’s facilities, and cannot lawfully delegate this duty or transfer the control of his station directly to the network or indirectly to an advertising agency. He cannot lawfully bind himself to accept programs in every case . . . The licensee is obliged to reserve to himself the final decision as to what programs will best serve the public interest. We conclude that a licensee is not fulfilling his obligations to operate in the public interest, and is not operating in accordance with the express requirements of the Communications Act, if he agrees to accept programs on any basis other than his own reasonable decision that the programs are satisfactory.

The scarcity rationale persisted. In *Red Lion v. FCC* (1969), the Supreme Court built upon *NBC* and effectively limited broadcast speech to those with a license to serve public interest:

Because of the scarcity of radio frequencies, the Government is permitted to put restraints on licensees in favor of others whose views should be expressed on this unique medium. But the people as a whole retain their interest in free speech by radio and their collective right to have the medium function consistently with the ends and purposes of the First Amendment. It is the right of the viewers and listeners, not the right of the broadcasters, which is paramount.

Despite the fact that broadcasting became a primary vehicle for otherwise-protected political speech, (1) those broadcasting without a license could be prosecuted as “pirates” and (2) licensees were obligated to follow FCC rules and regulations.

Broadcasters argued in the 1960s that they had been relegated to second-class status with respect

to First Amendment protections. The Radio-Television News Directors Association consistently argued that the chilling effect of, for example, requiring program balance through the Fairness Doctrine was in effective prior restraint. The doctrine required broadcasters to (1) air coverage of controversial issues of public importance and (2) offer significant contrasting viewpoints of these issues. Eventually, the courts concluded that the doctrine had been developed by the FCC in 1949, and even though Congress (though not the president) supported retaining it, the FCC had the legal authority to discontinue it in 1987. Congress twice attempted to reinstate it, but both times President Ronald Reagan and then President George H. W. Bush refused to sign legislation. The change opened radio airwaves to strident political (largely right-wing) advocates, such as Rush Limbaugh. Balance was replaced by advocacy, as the radio marketplace sold swaths of time for those willing to pay to present their views. Despite this, broadcasting remained a licensed medium.

Obscenity and Indecency

While journalism only rarely approaches questions of obscene or indecent content, it does happen. In the *Miller v. California* (1973) case, the Court's decision offered a three-part test to identify obscenity (which is unprotected by the First Amendment) from indecency (which is): (1) whether the average person, applying contemporary community standards, would find the work, taken as a whole, appeals to prurient interests; (2) whether the work depicts or describes, in a patently offensive way, sexual conduct specifically defined by applicable state law; and (3) whether the work, taken as a whole, lacks serious literary, artistic, political, or scientific value. A positive finding on all three points defines the obscene. It falls to juries to decide whether the material appeals to "prurient interests" based upon community standards. Patent offensiveness is a question of specific state law. *Miller* affords protection to sexually oriented material if it has some degree of serious value. Print media have been granted greater freedom to publish sexual content, as they are easiest to keep from children through local zoning regulation.

Within obscenity law, child pornography is a special class. *New York v. Ferber* (1982) provided

a compelling government interest in protecting minors from any form of exploitation. Nevertheless, *Ashcroft v. Free Speech Coalition* (2002) rejected the Child Pornography Prevention Act of 1996 as an unconstitutional burden on free speech.

One of the clearest divisions between speech limited on broadcast channels and that allowed on subscription services (such as cable or DBS channels) and the Internet is indecent material, which the FCC and Congress have agreed to restrict to a "safe harbor" defined as the hours of 10 p.m. to 6 a.m. on radio and television stations.

In *FCC v. Pacifica Foundation* (1978), the Supreme Court upheld the FCC's enforcement of 18 U.S.C. §1464, which prohibits indecency over the air. When a New York City radio station aired comedian George Carlin's monologue that included "seven words one could not say on television," the FCC took note of the violation of its rules. The Carlin monologue, which was reproduced in the appendix of the case, expressed the forbidden words multiple times.

On appeal, the Supreme Court agreed with the FCC that censoring indecency from the air did not run afoul of First Amendment guarantees, as such speech was allowed during late night hours when a child was less likely to be listening. Nevertheless, Justice William Brennan, one of four dissenters in the case and a First Amendment purist, found such FCC regulation to have crossed the line into unconstitutional government censorship of speech.

Justice Brennan accurately predicted the battle lines drawn over the next three decades, as the FCC later challenged some broadcast "shock jock" programming, such as that of Howard Stern and "Bubba the Love Sponge," both of whom would be eventually removed from broadcasting and shifted to subscription satellite radio, which is far less regulated. Eventually, the FCC extended its regulatory sweep to punish "fleeting expletives"—profanity blurted during a live broadcast (though a federal appeals court forced a review by the Supreme Court). Much of the FCC attention to such programs, in the view of many analysts, appeared to be driven by socially conservative activist mass letter and email campaigns that put pressure on the agency to "clean up" the airwaves.

The FCC has long restricted indecent speech to late evening hours "safe harbor" when children are less likely to be present in the audience.

Broadcast indecency, which blurs the definition between indecent and obscene, is defined (as upheld in the *Pacifica* case) as sexual or excretory activities or organs in material that panders or titillates without broader social or political value. Whether something is indecent or obscene is determined by context, however, thus making each situation unique.

The FCC applies a national contemporary community standard for the broadcast medium. Generally, cable and satellite services have been held by the courts to be largely free from indecency regulation and thus have more program freedom than their broadcast brethren because people must choose to subscribe to and pay for the service.

As it had before (with film and then video tape), technology intervened. The Internet offered a global distribution network for media content determined to be obscene under the law to become the first profitable online industry—pornography. In the absence of international obscenity laws, national laws are designed to curb or prohibit the production, distribution, and sale of sexual materials. Current enforcement typically includes attempts to identify sexual predators in the online environment and prosecute them. For example, the U.S. Justice Department in 2006 sought but failed to obtain a judicial order against the search engine Google to turn over records on millions of users' searches as part of a government effort to uphold online obscenity law.

Political Speech

Political speech is at the core meaning of the First Amendment. The theory is that a society needs a free exchange of ideas and an unfettered press in order to make good political decisions elect the best representatives and allow democracy to function. Therefore, political speech has the highest level of protection under American law. In recent years, courts have granted broadening commercial speech (advertising) rights, but these are far less sweeping than judicial deference given to any speech found to have political value. In this context, courts apply a strict scrutiny test to governmental restriction targeted at speech. The burden in these cases falls to government to provide justification for limiting free expression. Even where there is a compelling government interest, such attacks on free speech must

be supported as necessary, and they must be narrowly tailored to advance the interest. Even here, government may not exercise unconstitutional actions. However, restrictions that are found to be content neutral (i.e., not targeted at specific political messages) may find sympathy from the courts.

Repeatedly, American courts have protected political speech as central to democratic freedom and self-government. Legal theorist Thomas Emerson (1970) offered the strongest theoretical arguments for defending a robust set of First Amendment rights: free speech allows for discovery of truth needed for democratic decisions by serving as a check on excessive government power; free speech increases political stability by offering a safety valve to relieve pressure that builds in a society; and it promotes slower and less traumatic social change. Emerson's summary concludes that free speech allows for the fulfillment of individual enrichment, encouragement of the human spirit, and a greater understanding of humanity. In practice, government today is less engaged in playing the role of censor than are global media corporations, which do so through self-censorship within the context of program decision making.

The American Library Association (ALA) links censorship to the degree of intellectual freedom in a society. The American Library Association views censorship of all forms of "expressive materials," such as books, videos, or other art, as taking place when these are "removed or kept from public access." Censorship typically begins with an individual, group, or organization raising public concerns about specific media content. These complaints tend to be made to government officials. Often, the objectionable content has a literary or artistic nature. The National Coalition Against Censorship (NCAC) aligns dozens of groups seeking to "educate our own members and the public at large about the dangers of censorship and how to oppose them."

Libel as Censorship

In *New York Times Co. v. Sullivan* (1964), the court made a landmark decision protecting the media's right to criticize the performance of public officials by requiring any such person to prove "actual malice" on the part of media in the

publication of a negative report about that official. Failing this high bar, negative media comment stands and is protected. In the case, the context of a 1960 advertisement protesting the treatment of civil rights activists was found not to libel an Alabama public safety official who had brought a suit for libel:

Thus, we consider this case against the background of a profound national commitment to the principle that debate on public issues should be uninhibited, robust, and wide-open, and that it may well include vehement, caustic, and sometimes unpleasantly sharp attacks on government and public officials.

The *Sullivan* court went so far as to quote James Madison from *Elliot's Debates on the Federal Constitution* 4 (1876): "Some degree of abuse is inseparable from the proper use of everything, and in no instance is this more true than in that of the press."

In the Internet age, the Telecommunications Act of 1996 and the *Reno v. ACLU* (1997) case have been used to protect Internet service providers as well as websites by treating them as publishers. In *Zeran v. America Online* (1997), a federal court limited liability in a libel case. In *Blumenthal v. Drudge* (1998), America Online was protected against a separate libel suit brought by a former aide of President Bill Clinton (1993–2001) against the online gossip website, the Drudge Report.

Global Internet communication made it more difficult for governments to use censorship, but surveillance and data privacy grew in importance after the Cambridge Analytica and other prominent data breaches. The European Union, as well as California and other large states, have begun to protect data privacy as a human right. In addition, use of biometric data, such as facial identification by Facebook, has been restricted. U.S. law since the late 1990s has emphasized adult freedom of expression, as well as openness to act as publishers. Voices grew in number and strength through the inherent power of social media influence across social networks. Platforms such as Facebook, Instagram (owned by Facebook), and Twitter exercise power through end-user terms of service contract law. Corporations have power to warn users, filter content, and shut accounts. In

this sense, governments may indirectly exercise censorship by threatening and/or persuading social media sites to respond to user behavior for a variety of reasons—cyber bullying, indecent speech, threats, and other rationale. In some cases, threats may rise to the level of criminal charges, but the U.S. Supreme Court has ruled that the state of mind of a user must be considered at trial. The Court also has emphasized that the Internet is our "modern public square," and First Amendment freedom of core political speech must be protected.

Censorship of media messages has been a constant ever since the freedom to publish and speak began broadening several hundred years ago with case law in England through common law evolution and was carried to the colonies and ultimately enshrined in the First Amendment. The Internet is perhaps the most revolutionary development since the invention of the printing press to empower people, especially those outside elite centers of political and economic power, to use free speech and press as a challenge to the status quo. Thus, government censorship activities may be predicted to extend beyond the press to average citizens disseminating media content.

CENTRAL AMERICA AND THE CARIBBEAN

This entry discusses the danger of being a journalist in Central America, challenges of media convergence in the Caribbean, media ownership concentration in Central America, as well as investigative and collaborative initiatives in the region. Issues faced by Central American countries include corruption, migration and poverty, impunity, gangs, and drug trafficking. The Caribbean territories share some of these issues with Central American countries, in different intensities. Some evolved free of civil wars and dictatorships, but many experienced large and conflictive independence

processes from colonial countries. Like their continental neighbors, these territories face social inequality and the impact of increasingly frequent natural disasters, which complexifies the role of a crescent media sector.

This context directly affects news media initiatives, which makes the exercise of journalism in the region challenging in many ways. Despite the challenges, many initiatives flourish, strengthening collaborative, investigative, and independent practices.

Central America is the region that lies between South America and Mexico and covers the isthmus that separates the Pacific Ocean, to the west, from the Caribbean Sea, to the east. It comprises seven countries: Panama, Costa Rica, Nicaragua, Honduras, El Salvador, Guatemala, and Belize. The Caribbean region comprises a group of more than 700 islands, islets, reefs, and cays laying from the Gulf of Mexico and the peninsula of Florida (United States) to the north coast of Venezuela. They are organized into 30 territories including sovereign states, overseas departments, and dependencies. Some classifications include part of the islands in Central America; others include some of the continental countries, including from South America, in the Caribbean. This entry presents a distinction between continental and insular territories as the main division.

Central America: A Dangerous Place to Be a Journalist

Costa Rica ranked the highest of all Latin American countries in the Reporters Without Borders (RSF) Freedom Index of 2019. However, many countries in the region have lost their positions since then, leading RSF to classify Central America as one of the most dangerous places to be a journalist in the world. The working conditions for journalists and the situation of press freedom are complicated because of government censorship, violent conflicts, insufficient infrastructure, and the action of non-state actors, including cyber activists. Civil conflicts in the 20th century left some 200,000 dead in Guatemala, more than 75,000 in El Salvador and 50,000 in Nicaragua. After a decade of pacification in the 1990s, the United Nations Office on Drugs and Crime (UNODC) requalified Central America as the

most violent war-free zone in the world, as it surpassed the number of annual deaths recorded during civil wars. The situation is worse in the countryside, where the complete absence of state protection goes hand in hand with controls imposed by criminal groups. The growing organized crime, including some groups associated with state agents, has become a direct threat to the exercise of civil liberties, including the freedom of expression.

In Honduras, 67 journalists have been killed since 2003, and more than 90% of the cases remain unsolved. The polarization around the deposition of President Manuel Zelaya, in 2009, led to an increase in violence against media workers. In Nicaragua, security forces raided and seized offices of media critical of President Daniel Ortega's regime. Incessant stigmatization, harassment campaigns, death threats, and arbitrary arrest led the country to fall 24 places on the RSF Index in 2019. Some journalists believe that the risks posed by criminal groups make the situation even harder than during the time of civil wars. The different illegal actors involved and their penetration into the structures of the state and society make it difficult to identify potential aggressors and endangered territories. In a poll conducted by María Isabel Sánchez Reyes in 2015, more than half of the 33 journalists interviewed said they felt as threatened by state security forces as by drug traffickers and gang members. Apart from awareness campaigns and public complaints made by civic organizations and unions, neither are there protective mechanisms in place nor journalists trained to work and protect themselves in this kind of violent context.

Additionally, journalists covering political issues in Central America suffer constant retaliation and limitations to their work. A strategy frequently applied by governments in Central America is to use public advertising budgets to reward news media organizations reporting favorably while reducing or suppressing any advertising on opposing media platforms. Access to public information is another currency managed under the same logic. Some journalists also get involved in corrupt schemes with politicians or members of organized crime, due to bad structural conditions and low salaries in the region. These cases are frequently used by politicians to associate crimes against journalism with corruption without proper

investigation. In these countries, harassment and intimidation by politicians, together with armed attacks, corruption and organized crime, can result in self-censorship and exile. One report from the Committee to Protect Journalists (CPJ) from 2014 highlights the consequences of this situation with respect to the access to quality information in countries facing huge societal problems.

The Caribbean region hosts one country in the list of the most censored countries according to CPJ; it is Cuba. Despite moving up three positions in the ranking of press freedom in the 2019 Reporters Without Borders Index, print and broadcast media are still highly controlled by the Cuban one-party regime as of 2021. Improvements stemming from expanded access to digital platforms in the last decade have allowed for some freedom of expression, but Internet connection is still very expensive and the state-owned service provider, ETECSA, can block content, and restrict access to critical initiatives. For instance, several journalists were detained for reporting on the aftermath of hurricanes in 2016 and 2017. In April 2019, Roberto Jesús Quiñones, from the news website CubaNet, was detained and beaten while covering a trial in Guantánamo Municipal Tribunal.

Caribbean: The Challenges of Media Convergence

Since the turn of the 21st century, the countries in the English-speaking Caribbean have increased their number of media outlets as well as their advertising revenues and circulation numbers. This evolution started with deregulation and liberalization policies in the 1980s, which led to privatization of many state-owned broadcasting organizations and to the development of diverse and competitive media markets in these countries. The improvements in the audiovisual sector contributed to a boost in the print sector and coincided with technological evolutions that allowed the emergence of many digital news platforms. Even the economic crisis of 2008, which strongly affected revenues from advertising, was largely compensated by increasing numbers in circulation.

However, the positive results in advertising and circulation raise some concerns. Journalists in the

region indicate that the constitution of a competitive market brought practices that prioritize profits over quality journalism. A poll with 33 journalists from five English-speaking Caribbean countries, conducted from 2005 to 2012 by Juliette Storr, revealed concerns about a preference for sensational approaches and the homogenization of sources and contents, as well as layoffs, high turnover, and replacement of senior reporters by inexperienced ones. They believe deregulation and liberalization turn journalism into a business rather than a public service.

Newspapers were still strong in the Caribbean in the two first decades of the 21st century. Oral tradition and the age of the population are two important factors that keep print media relevant in these territories. Information circulates between literate and illiterate people primarily through interpersonal networks and traditional news outlets. Unequal access to the Internet may also contribute to a preference for printed newspapers. According to Statista, as of January 2020, the Dutch territory of Aruba had the highest Internet penetration rate (97%), and the sovereign state with the highest percentage of citizens online in the region was the Bahamas (85%). On the opposite position, only a third of the population had access to the Internet in Haiti. Cuba (63% penetration) and the Dominican Republic (75% penetration) are the Caribbean countries with the largest numbers of active social media users.

Since the turn of the century, there has been a lot of effort toward media convergence, considering a crescent demand for digital integration coming from young audiences as well as from an already present competition between newspapers, audiovisual outlets, and digital platforms. An opportunity arose to reduce operational costs and diversifying formats. A challenge also arose in terms of training journalists and preserving working conditions and editorial quality in an emergent integration of news companies into business models. It is a matter of debate, how many of the changes are made by journalists and editors, and how many come as an imposition of a globalized industry.

Many media companies in the region enlarged their international operations, counting on the digital evolution to reach the Caribbean diaspora spread all over the world. For instance, the Gleaner Company Limited is the largest media

conglomerate in Jamaica and operates media services also in the United Kingdom, Canada, and the United States, including newspapers, both online and print operations, radio stations, and book and magazine publications.

Journalists in the region also face important barriers to access information. Despite the existence of some laws demanding transparency and accountability, secrecy practices prevail in public institutions and private organizations. As a result, the Caribbean region has one of the highest numbers of lawsuits against journalists and media organizations. Defamation, national security and defense, and secrecy legislation are resources frequently employed by governments to discourage investigative journalism and critical editorial approaches related to public issues and decisions. The Organization of East Caribbean States, whose associate members are Antigua and Barbuda, Dominica, Grenada, Montserrat, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Anguilla, British Virgin Islands, Guadeloupe, and Martinique, has fallen 15 places to the 50th position in the RSF Index 2019, mainly because of editorial censorship. The evaluation took into consideration the poor conditions for the exercise of journalism as well as high levels of interference from political actors over news media outlets. In some countries, authorities monitor even social networks, leading to self-censorship.

Two Faces of Media Ownership Concentration

Some experts believe the structure of the media sector contributes to the vulnerability of journalists in Central America. A special report on threats to press freedom published in 2015 by the International Federation of Journalists Regional Office for Latin America and the Caribbean indicates that the high media concentration seriously affects the free exercise of the profession, subjecting the latter to economic and political agendas. The issue is so striking that some journalists say that if armed conflicts threaten their lives, the emergence of media corporations threatens their ability to do good journalism, because of the network of interests among political, economic, and media powers.

In 2009, the Trust of the Americas and the Instituto Prensa y Sociedad (IPyS) [Press and

Society Institute] published a report about the concentration of media ownership in Central America. Analyzing data from 2004, this report indicated that the media sector in each country was rather small and very concentrated in the capitals. Radio was still the platform with the largest penetration, although it attracted fewer investments. Television was the platform that concentrated more than 50% of all advertising in most of the countries in the region; it was also the one where ownership was more concentrated. Public and state media outlets are scarce and underdeveloped. More recent reports from individual countries suggest that the situation has seen little change afterward.

The IPyS report depicts a historical evolution of the information and communication sector. For many decades, it was concentrated in the hands of the state, which considered news media outlets strategic for the maintenance of authoritarian regimes. Since the 1990s, with the development of democracies in Central America and under the influence of austerity programs, most of the countries of the region adhered to privatization processes, in which the information and communication sector went to private hands, predominantly foreign hands in the telecommunications sector. The report talks about moving from state monopolies to private oligopolies.

One example is the case of the Mexican investor Angel Gonzalez, who became a major force in Central American broadcasting. In addition to owning television channels and radio stations in many countries in the region and beyond, Gonzalez uses his economic and media power to influence editorial lines. Journalists speaking against his initiatives or his friends in the political sphere are frequently dismissed. Aligning himself with powerful political actors, he has ended up controlling the broadcasting system and leaving little room for journalists who wish to develop controversial topics.

Additionally, according to the *Informe Medios Comunitarios y Libertad De Expresión 2017* (Report on Community Media and Freedom of Expression 2017), organized by *Observatorio Latinoamericano de Regulación Medios y Convergencia* (*Observacom*, Latin-American observatory of media regulation and convergence), Central America is the region with the least legal

recognition of community media in Latin America. The situation is aggravated by the use of auction mechanisms for the allocation of concessions in many of its countries and by the criminal prosecution of radio stations operating without authorization, with arrests of radio broadcasters and equipment seizures.

In the Caribbean territories, the 2000s saw a wave of merging operations that raised concerns. The constitution of conglomerates allowed economic scale and competitiveness in the globalized market, but the lack of anti-trust and cross-ownership laws allows multinational companies to operate without restrictions, affecting fair competition and editorial independence in the rather small-scale market of the several territories. The largest media conglomerate in the English-speaking Caribbean is One Caribbean Media. In 2012, it owned newspapers, television and radio stations, and publishing companies in seven Caribbean countries—Antigua, Barbados, Grenada, Guyana, Jamaica, St. Lucia, and Trinidad and Tobago.

Some of the countries display high levels of media ownership concentration individually. In the Bahamas, the Tribune Group Incorporated is the largest media conglomerate. In 2012, it owned five radio stations, an online media news service, and two newspapers. The second largest media conglomerate is the Nassau Guardian Group Ltd., which in 2012 also owned two newspapers, two radio stations, and a television station. Additionally, some media conglomerates include operations in other business sectors, deepening the collusion between economic and media powers. In the Dominican Republic, the historic *Grupo Listín de Comunicaciones* (*Listín* Communication Group) was bought in 2000 by Grupo Intercontinental (Intercontinental Group), a major financial services conglomerate that owned the country's second biggest commercial bank, expanding activities in all media domains.

Investigative and Collaborative Initiatives

The beginning of the 21st century saw the emergence and consolidation of several digital native outlets dedicated to investigative journalism in Central America. They have been innovating formats, business models, and editorial covering

choices, while building a reputation as qualified journalism and shaking established powers in the region.

One of the pioneers is the Salvadoran digital newspaper *El Faro* (The Lighthouse). Created in 1998, it is among the few media outlets in the region that conduct investigative journalism on organized crime activities, corruption issues, daily life violence, and migration in Central America—not without risks. Its reporters are used to all kind of threats. In 2015, after covering a massacre in a countryside village in El Salvador, the journalists reporting the story fled the country with their families, as they received menaces publicly, even in comments on *El Faro*'s Facebook page.

Part of the compensation comes with the repercussions of this kind of piece in the international press, which contributes to the debate around issues both internally and globally. The risk of developing investigative journalism in such a context is partially compensated by international repercussions of pieces related to the issues mentioned. There is interest coming from international outlets that reproduce what is produced in local outlets such as *El Faro*. This international repercussion has an internal benefit. After being depicted outside the country, the topic might get more attention inside the country; journalists reaching international outlets tend to be more respected, and this facilitates their work within the country. The global benefit is to raise debate about transnational topics such as migration and drug trafficking, including a local perspective (local from Central American countries). International press coverage legitimates the national coverage, makes people talk about it, and places the journalist in a better position of requiring information and talking about the topic.

In 2016, a collaboration between *El Faro* and New York Times journalists about gangs in El Salvador led to a frontpage article in the U.S.-based newspaper. Another collaborative editorial project with Univision, in 2017, approached the drama of Central American migrants and refugees. Additionally, international networks of journalism contribute to building legitimacy for the work of journalists. The more the stories get diffused abroad, the more difficult it becomes to accuse the journalists locally of corruption or biased covering.

El Faro combines investigative journalism and development of creative narratives to reach diverse audiences. This approach includes audio-visual storytelling and exploratory quests involving people—including both marginalized and powerful groups—whose stories are being reported. This model inspired many other initiatives all over Latin America. Founded in 2011, *Plaza Pública* (Public Square) inaugurated a new tradition of investigative digital journalism committed to human rights and public interest in Guatemala. Inspired by the notion of the public sphere, from Habermas, the platform focuses on themes that matter to civil society and have been largely neglected by mainstream commercial media. Another Guatemalan initiative is called *Nómada* and emerged in August 2014, anchored in journalistic principles of independence and transparency. This outlet focuses on politics, corruption, urban and rural Guatemalan social issues, identity issues, feminism and sexuality, covering topics, and employing formats that are not frequent in traditional media in the country and the region in general. *Nómada* counts partially on international funders of investigative journalism from around the world. Additionally, events, content services and crowdfunding campaigns, among other activities, provide the outlet with financial independence from traditional advertising models. As with *El Faro*, crowdfunding campaigns for *Nómada*, and other events seek to create a community around the initiatives and build citizen engagement with quality journalism in society.

The evolution of this kind of initiatives is, however, limited by a lack of access to the Internet in most Central American countries. According to Statista, in January 2020, five out of the 10 of the lowest penetration rates in Latin America were registered in Central America. Honduras was at the end of the list with 42%, just after Haiti. *El Faro* has hosted a radio program and podcasts in order to reach the countryside since 2013.

In the Caribbean, increasing access to digital platforms prompted investigative journalism, with important contributions coming from blogs and citizen initiatives that cover issues underrepresented in traditional media. In a country such as Cuba, technological developments open platforms for the expression of independent perspectives. The Global Investigative Journalism Network

highlights the innovative practices of Cuban blogs. Although illegal under the national Constitution, they develop applications to make content available online and offline and to run crowdfunding campaigns that defy the instability of the Internet connection inside Cuba, the internal persecution, and the U.S. blockade against the island. In 2017, *El Estornudo* received the Gabriel García Márquez Journalism Award, and the *Postdata* team was a finalist in the Data Journalism Awards.

In general, these initiatives confront a long tradition of high consumption as well as of imported programming content in mainstream media, consolidated by long-term colonization processes (some still in place), and by the small scale of local productions that increases the attraction of cheaper content ready for broadcasting. The JET FM radio station, operated by Jeffrey Town Farmers' Association, in Jamaica, is one example of a community-based experience that connects content production with local development and social empowerment processes. In a Jamaican urban context, Roots FM radio station plays a similar role, supporting grassroots communities with information regarding educational, work, and human rights issues. Another example is *Toco* FM radio station, the first community radio in Trinidad, launched in 1997. Together with *Tambrin* radio station, in Tobago, it is considered one of the longstanding successful and sustainable cases of associating news and music with local development issues. This kind of experience, flourishing in rural and urban communities in almost all Caribbean territories, goes beyond definitions of journalism practices and inserts them into larger perspectives of social change in the region.

CHECKBOOK JOURNALISM

Checkbook journalism is the label applied when journalists or their news organizations pay for information. Print and television tabloids freely admit they regularly offer cash in exchange for exclusive interviews or for news tips. However, most mainstream news organizations, along with the Society of Professional Journalists (SPJ), condemn paying for interviews, arguing that it undermines journalistic credibility and independence. At the same time, these organizations sometimes pay for the right to use video or photos. They provide substantial consulting fees to former government officials, politicians, lawyers, or others who might provide expertise or commentary. They sometimes pay sources' travel expenses or take sources to lunch or buy them coffee. These practices may be more widely accepted than direct cash payments for interviews, but some critics argue that they, too, have the potential to compromise credibility. And, while probably in the minority, some professional journalists and media scholars suggest that there are times when it may be only fair to compensate private individuals for the value of their information. This entry looks at the history of checkbook journalism in the United States and ethical concerns that have been raised about the practice.

The History of Checkbook Journalism

The outcry over checkbook journalism intensified in the 1980s as 24-hour cable news channels and syndicated television tabloids began to compete with more established news organizations for public attention. Moreover, as video cameras became ever cheaper and more portable, television stations and networks sometimes paid for video taken by individuals who were neither newsroom employees nor traditional freelancers. However, checkbook journalism did not begin with the invention of the camcorder nor has it been exclusively used by tabloids. Mainstream news organizations also have pulled out the checkbook from time to time—whether it was *The New York Times* paying for an exclusive interview with a crew member who survived the Titanic sinking in 1912 or *Life Magazine* paying for interviews with astronauts and their families in the 1960s.

Some of the best-known instances of checkbook journalism occurred in the 1970s in the aftermath of the Watergate investigation that led to the first and only resignation of an American president. Richard Nixon left office in 1974, rather than face impeachment, and was quickly pardoned by his successor, Gerald Ford. British talk show host David Frost, sensing the hunger for answers in the absence of a trial either in the Senate or in the criminal courts, paid the former president \$600,000 in exchange for a series of recorded interviews. The interviews, edited into 49-minute episodes, aired in prime time in the spring of 1977. They would be remembered as the most-watched news interviews in U.S. television history.

None of the three major networks that dominated American television at the time would carry the paid-for Frost-Nixon interviews. So the entrepreneurial Frost sold the interviews station by station in markets across the United States in a barter-syndication deal in which he split advertising minutes with local broadcasters and personally pedaled national spots. There was early skepticism about whether a non-journalist like Frost would or could ask tough questions, even though Nixon's contract obligated him to discuss Watergate. However, combining his team's research with his own considerable on-camera skills as an interviewer, Frost used the power of

the television close-up to give American audiences the closest thing they would ever hear to an apology from the former president—along with such jaw-dropping moments as Nixon's claim that when the president does something, it is not illegal.

Not every attempt to buy Watergate stories was so successful. Before the Frost-Nixon interviews, CBS News had earned intense criticism when it paid H. R. Haldeman, Nixon's former White House chief of staff, \$100,000 for what turned out to be little in the way of useful disclosures from the former advertising executive who had gone to prison for his part in the Watergate cover-up. CBS justified its payments by characterizing the interview as Haldeman's televised "memoirs," a genre for which book publishers traditionally had paid former government officials.

With cameras back in many courtrooms by the 1980s, some of the most controversial instances of checkbook journalism arose from competition in coverage of sensational criminal trials. Among these was the case of O. J. Simpson, former football great turned movie and television celebrity charged with murder in 1994 after the gruesome stabbing of his former wife and her friend. In the early days of the investigation, a tabloid paid the owner of a Los Angeles knife store and one of his employees for an exclusive interview revealing that, prior to the stabbings, they had sold a stiletto to Simpson and sharpened it for him. They said Simpson had paid cash and they had kept no receipt. No murder weapon had been found, so theirs was potentially important testimony, compromised by the deal they had struck with the press.

It has not been only the tabloid press paying substantial sums for sensational crime stories. In 2010, a lawyer representing Casey Anthony, accused of murdering her toddler daughter, revealed that in 2008 ABC News had paid \$200,000 for exclusive rights to Anthony family photos and home videos. ABC denied that the payment had entitled it to exclusive interviews with Anthony, but the SPJ Ethics Committee was skeptical—condemning what it called a growing trend of checkbook journalism by major television networks. ABC had only compounded the problem by failing to disclose the payment for more than 2 years.

Ethical Considerations

Invoking the principle that journalists should “Act Independently,” the SPJ Code of Ethics explicitly rejects checkbook journalism: “Be wary of sources offering information for favors or money; do not pay for access to news” (SPJ, 2014). Whenever journalists pay sources, it undermines the credibility of both the source and the journalist.

There may be instances in which even private individuals have a civic duty to come forward with important information in the public interest. In such cases, doing the right thing should be motivation enough to talk with the press. The private citizen who in 1992 happened to videotape the police beating of Rodney King that led to a national public outcry and criminal charges against multiple Los Angeles police officers sold a local television station the rights to air his video. He later sued for copyright infringement when news organizations around the country rebroadcast the video without his permission. The courts denied the videographer’s copyright claims on the grounds of the overwhelming public importance of the tape. As a legal matter, the right to know took priority over the videographer’s intellectual property rights. And as an ethical matter, some would argue, even a private individual with such important information ought to put the public interest above his own.

Paying for News in the Information Age

However, the SPJ Code of Ethics also exhorts journalists to “Minimize Harm,” reminding them that “private people have a greater right to control information about themselves than public figures and others who seek power, influence or attention” (SPJ, 2014). Federal statutes and the laws of all 50 states give the press and the public the right to access at least some government meetings and documents. However, there is no legal right to access or publish information about the purely private affairs even of elected public officials—and surely not to pry into the personal lives of private individuals.

While journalists provide an essential public service, they are paid by news organizations that, for the most part, operate for profit. There are

times when it may be only fair for news organizations to compensate private individuals for the value of the information they provide. The emergence of social media, whose business models are based on collecting personal data about end users and selling ads based on that data, has raised new questions about who deserves to control and profit from personal information.

In the Information Age, the debate over checkbook journalism may no longer be a simple binary choice of whether or not to pay for news. More complex questions arise. There are certainly instances (as in coverage of criminal trials) in which checkbook journalism has the potential to erode public faith and disrupt due process. However, not every individual with an interesting story to tell is a potential witness in a criminal trial. The debate then shifts to questions of transparency and accountability, of how to decide when it is appropriate to exchange value for value and, even more important, how to disclose and explain a decision to pay for information in a way that allows the public to make informed judgments about credibility, independence, and motivation.

CHINA

As one of the world's oldest civilizations, China has a rich history of media communication. Government news sheets, known as *tipao*, were disseminated among Han Dynasty court officials in the 2nd and 3rd centuries CE and later printed during the Tang Dynasty in the 8th and 9th centuries. As of 2021, journalism in China continues to evolve and adapt, creating a vibrant arc that has captured the attention of media scholars and pundits. This entry discusses the three periods into which Chinese journalism is generally divided—The Party Press (1949–1978), Commercialization and Conglomeration of the Party Press (1978–2003), and Media Convergence and Global Media Expansion of the Party Press (2003 to present). China's journalism offers insights and rationale for its placement in the media landscape.

The Party Press (1949–1978)

The Party press traces its roots to radical journals of the early 20th century. In the years after the fall of China's last ruling dynasty (Qing), the country experienced increasing turmoil, and future leaders of the Chinese Communist Party (CCP) were involved in publishing journals to rally mass opposition to Western and Japanese imperialists and Chinese warlords. Mao Zedong stressed the journalists' role in learning from the masses and highlighted the role it should play to articulate a unified voice of support to resist foreign aggression and promote China's modernization. This was to be achieved through a symbiotic “mass line” model of political communication, where the Party collected the concerns and aspirations of the masses that could be translated into systematic action. In this way, the mass line's continuous circular process not only produced collective knowledge but also raised the masses' consciousness. Thus, when implemented rigorously, the mass line acted as an effective mechanism to encourage popular participation and to provide indispensable fodder to formulate vital policies in which the Party press would propagate. This explains why, until this day, the mainstay of Party news focuses on trends and highlights achievements. As the Party mouthpiece, the Party press is not beholden

to breaking news events but tends toward conclusive and comprehensive analysis, attributed to its mass line communication process.

Despite the criticisms that Party journalism does not allow the masses to engage in policy formulation and that it has no concept of the people's right to know the deliberation process, the press achieved by Mao's mass line principle was successful in organizing both party organs and nonparty journals to target underserved groups such as peasants, youth, women, and workers. This multisectoral, multitiered press system corresponds to the Party-state territorial-administrative divisions of central, provincial, and municipal press as well as newspapers run by women's federations, youth leagues, trade unions, farmers, and other social groups, and it holds tremendous potential in enabling diverse voices to be heard. Even so, critics point out that disastrous incidents such as the Great Leap Forward (1958–1961) and the Cultural Revolution (1966–1976) laid bare defects of a monopoly Party press where state ownership and inadequate institutional mechanisms to ensure public accountability led to detrimental consequences. For this reason, advocates of the normative liberal perspective argue as the “fourth estate,” the press must serve its watchdog role to hold power accountable and consequently, press freedom is mainly defined as freedom from State ownership and control.

However, the Socialist press perspective argues otherwise. From the socialist perspective, state ownership and oversight of the press not only does not undermine, but in fact serves to ensure that press freedom is extended to all the people—as exemplified by its diversity of publications aimed to give voice to the underserved communities, and not just the capitalists who own the press.

Nevertheless, media scholars point out that in the post-Mao era, it was the articulation of the core concept of the “Party principle” and not Mao's “mass line” that was used to justify the Party's domination of the press. Critics argue that unlike Mao's “mass line,” which institutionalized channels to enable bottom-up feedback, the Party principle's top-down measures emphasize the Party's guiding ideology, regulation, and control, leaving little room for bottom-up feedback. Party policymaking remains opaque and centralized; important policies are reported as final decisions, leaving little room for debates.

Commercialization and Conglomeration of the Party Press (1978–2003)

In 1978, Deng Xiaoping's economic reforms opened the door to foreign technology and investment, revamping existing institutions, including news media. Even though this top-down state-initiated media marketization process remained heavily regulated, the power of capital nevertheless increased, creating frictions between the Party-state and the increasingly commercialized Party press.

This tension was exemplified by the reintroduction of media advertising, which quickly became the most important source of income for the newly commercial Party press. The drive to ensure economic independence gave news organizations increased operational autonomy, particularly for the newly launched commercial subsidiaries of provincial-level Party organs. This also meant that the power to influence editorial decisions had, to some extent, been transferred from the central to the local and from the Party-state to advertisers and readers.

As news media became responsible for their own economic survival, they were compelled to diversify content to include cultural news, sports, entertainment, and watchdog reporting to meet reader demands. For example, while Guangdong provincial-level Party organs flagship paper *Southern Daily* maintained their usual fare of government announcements and propaganda, their newly established commercial subsidiaries such as *Southern Weekly* and *Southern Metropolis Daily* focused on social news, current affairs, and entertainment, covering human interest stories from the plights of migrant workers to problems of an aging population and homeowner rights. The early reform years of the 1980s in particular brought commercialization and loosening of restrictions. There were calls for reforms throughout society, including more democracy, press law protections, and even news media freedom. Many Chinese media workers, including those from *People's Daily*, marched publicly in the streets to support reform during the 1989 pro-democracy movement. That movement ended abruptly on June 4 when troops moved in to stop protests in Beijing's most famous public space,

Tiananmen Square. The Tiananmen crackdown reverberated across society, stalling political and economic reform as well as reforms within the news media. Since then, the Party has emphasized that submission by journalists to Party leadership and propaganda discipline must always be the basis when speaking on behalf of the people.

The 1990s became known for the emergence of large media groups as the government began curbing proliferation of media organizations through consolidation and conglomeration. Decentralization and unfettered commercialization in the 1980s had led to a highly fragmented press system that was overextended and lacked economy of scale. Government bureaucracies and non-Party organizations' papers were chipping away the circulation and advertising revenues of Central and Party organ press. The imminent 2001 World Trade Organization accession also called for an overhaul of the domestic media to ensure it would have the financial capability to compete with global media conglomerates. CCP's strategy was to harness the commercial forces to turn Party newspapers into profitable ventures. As such, although press groups are financially independent, they are not independent businesses registered with the government's industry and trade bureau and thus remain under the oversight of the Party's propaganda department.

The commercialization and conglomeration of the Chinese press substantially reshaped power distribution and political relations from the Central government to the local government. As of 2021, regional governments have greater say to defend and expand their local interests as they are responsible for their own news production costs, establishing their own distribution network, and selling their publications on a competitive news market. Meanwhile, China's modernization trajectory was creating ever growing economic and social inequality. Nationwide privatization of state-owned enterprises created a growing unemployed working class and a disintegrated social welfare system. Migrant workers in the millions were coming into the cities to find work. These conditions and the growing endemic local corruption gave rise to China's watchdog, or investigative journalism.

Known in China as *yulun jiandu*, or *supervision by public opinion*, this type of journalism reflects the views of the general Chinese population as a means of monitoring the effectiveness of

Communist Party policies. These watchdog stories reflected social instability that resulted from accelerated market reforms. These included large-scale worker layoffs in money-losing state enterprises, dislocation of farmers, and unfettered taxation abuses by local governments. China's economic reform policies had created tremendous growth—making the nation among the world's fastest growing economies—but they also created tremendous opportunities for corrupt politicians and businesses.

Central Party leaders came to see China's press as an effective, comparatively inexpensive tool to reduce local official corruption by utilizing public opinion to monitor local official power and reflect public debate on China's problems. By doing so, watchdog stories expose government corruption and social ills, vet popular grievances, and create a closer identity between the people and the party. This watchdog function, however, was to be exercised under *yulun daoxiang* or "guidance of public opinion," which meant providing an official framework for controversial topics to "guide" public opinion to fall within the party line. In reality, however, Chinese journalists, particularly those from the commercial press, frequently found ways to challenge, test, and contravene the party's restrictions. One such example was through *yidi jiandu*, or "cross-regional media supervision," where the local press aimed their critical reports at officials in other provinces that did not have direct administrative authority over them.

Due to the development of more complex and demanding news coverage, media outlets began to attract and retain better qualified employees, who now were often expected to have college degrees. Many graduated from one of a growing number of journalism programs at Chinese universities and an increasing number were going overseas to study. The Party press also had more flexibility in who they hired and how, for their commercial subsidiary editions, including whether workers had to be party members. The media began to hire contract reporters "outside the system" or *tizhi-wai*, who had the advantage of not requiring bureaucratic party authorization—with its paper trail of employment history.

The increasingly vibrant commercialized Chinese press became a battleground for ongoing ideological debates about China's modernization

trajectory. The Liberal perspective, generally held by journalists working in the commercialized press, favored China's continuing integration into global capitalism. In contrast, the New Left is highly skeptical of capitalist globalization and the capitalist nature of Western liberal democracy. Concerned with the country's mushrooming social-inequality issues, the New Left sees revitalizing CCP's socialist legacy as a way to hold the Party accountable to its initial promise to build economic equality and advance social justice. These discussions would explode into the forefront of public debates with the rising popularity of the Internet.

Media Convergence and Global Expansion of the Party Press (2003 to present)

After the first 25 years of economic reform, as of 2021, China is addressing various problems and opportunities created by the introduction of market economy to the Party press system. Simultaneously, the rise of the Internet is one of the most important developments during this era and has tremendous social, economic, and political impact on the Party press. China's calibrated and controlled press reform is similarly applied to the development of its Internet. It has invested substantially in its Internet infrastructure and the country's online population has boomed. The number of Internet users in China had reached 854 million netizens by June 2019 according to China Internet Network Information Center (CNNIC) Statistical Report on Internet Development in China. This makes China netizens the world's biggest Internet market, although it represents just 61.2% of the country's population. The number of mobile Internet users is said to have reached 847 million, spurred on by the exponential growth of e-news and a myriad of e-products and services now available via smartphones.

Although Chinese citizens have embraced the Internet since the 1990s, the meteoritic growth and increasing popularity of the Internet, including its various social media platforms such as bulletin board system, blogs, Weibo (microblog), and WeChat since the 2000s meant ordinary people increasingly joined journalists in posting articles, videos, photographs, and other materials online.

The Internet has enabled Chinese consumers to become content producers and to directly participate in public discourse and opinion formation through various online tools. These participatory platforms accommodate the demands of an increasingly stratified and diversified Chinese society. Some media scholars theorize this as a sign of development of civil society in China as the Internet becomes a testing ground for public opinion formation and contestation.

One of the earliest well-known examples of the synergy between the Party press and the Internet to set the agenda for public discourse was the news story of the beating death of migrant worker Sun Zhigang as a result of physical abuse he suffered while in a custody and repatriation center in the southern city of Guangzhou. Sun was a young college graduate who had recently moved to the city to find work but was detained by police when he could not produce his temporary living permit and his ID card. While the story had originated in the print media, the Internet played a crucial role in prompting further public discussions, constitutionality debates among legal scholars, and dissemination of the story online nationwide. As a result, the punitive detention centers were abolished and replaced by service-focused centers to provide assistance to vagrants and beggars with no means of support in cities. The Sun Zhigang case highlighted how the Internet allowed real-time interaction between the commercial Party press, legal experts, and netizens, reaching a wider audience to jointly claim the agenda-setting power. At times, stories generated from Internet postings reemerge on major web portals where they generate more discussions, commentary, and dissemination. Other times, leads are picked up by the local press and further reporting of the story on their online platform reaches a broader national audience through the Internet.

China's Internet has transformed traditional journalistic practices in unprecedented ways, bringing about innovative journalistic practices. Many mainstream investigative journalists have used social media such as microblogging platform Weibo to share their field notes or full versions of their investigative reports that are watered down by their news organization. Their Weibo followers have become invested in their reporting process and experience the challenges journalists face,

which has helped improve their commercial competitiveness and expand the boundaries of reporting. New media technology also enabled netizens to become "citizen journalists," meaning ordinary people can engage in on-the-ground reporting with their mobile phones, particularly during crisis or suddenly breaking news events such as the 2008 Sichuan earthquake and 2011 Wenzhou train collision in the outskirts of Zhejiang Province. The term *online surrounding gaze*, or *wan-gluo weiguan*, is used to describe the potential dimension of public participation and the concentration of public opinion arising from the voluntary engagement of netizens. This online netizen participation and engagement generate synergy between the netizens and the Chinese press. A 2016 study on corruption cases exposed on Sina Weibo shows that ordinary netizens are often the main initiators of corruption exposes online; however, news organizations and online media outlets continue to play the essential role of agenda setting and disseminating the news about these corruption cases. In this way, news media organizations and news workers in particular, continue to play an indispensable role as the voice of the people.

As the general public increasingly turns to the Internet for their news, a serious disjoint between the Party-state agenda and the public agenda has emerged as the official Party organs are becoming increasingly irrelevant to the general public. During a 2007 politburo meeting, President Hu Jintao stated it is not enough for the Party to just *manage* the Internet, but the Party must also seek to actively *use* it. His first major media-related speech delivered at the *People's Daily* and *People's Daily Online* emphasized the need to better utilize the Internet media and commercial subsidiaries of the Party press as resources to reach the public. This strategy is commonly referred to as *grabbing the megaphone*, or *qiang laba* by Chinese journalists, which means the Party press must set the agenda for major breaking stories. This direct response reflects a change in the nature of agenda setting to aggressively covering breaking news in order to stay ahead of the freewheeling commercial press and the Internet to properly channel public opinion, as opposed to setting the agenda merely by control mechanisms such as censorship or news blackouts. A 2005 study on the official Party publication *News Line* urged the online

Party press to analyze the patterns of Internet dissemination, find viable means to guide online commentary, and promote correct online opinion to ensure the Party press maintains the high ground in manufacturing public opinion.

At the same time, the Party-state continues to develop highly sophisticated monitoring and control mechanisms to censor topics that are considered disruptive to social order. It does this by using the latest technology, additional and existing laws and regulations, and new variations of traditional control tactics. The Ministry of Public Security's "Golden Shield Project," sometimes known as the *Great Firewall*, is an extensive communications network and computer information system that operates to block objectionable Internet sites and web feeds and filter unwanted content. The Party-state also enlists nongovernment entities and individuals, such as ISPs and content providers, to help it prevent users from posting items that lead to collective action and accessing sensitive content. In recent years, China has stepped up enforcement of online real name registration, criminalizing Internet rumormongering, and banning cross-regional reporting to rein in journalists and Internet writers.

In this way, communication technologies have brought both challenges and opportunities for the Party press. Media convergence sought to leverage the media industry's commercial and technological advances to ensure state-owned or state-controlled media remain commercially viable and competitive. Traditional party media expanded their communication channels by adopting publishing and broadcasting that fit mobile platforms. As early as 1997, the Central Party press *People's Daily* established the *People's Daily Online*, and later mobile versions in 2007 to target smartphone users, followed by *People's Video* in 2011. *People's Daily* launched its mobile app in 2014 enabling feedback and comments from readers. *China Central Television* (CCTV) launched China's first national Internet TV in 2009 offering video-on-demand services and an online community network. Various press groups located in the wealthy east coast metropolis such as the *Nanfang* Media Group, *Hangzhou Daily Press* Group, and *Shenzhen Press* Group were all restructured to become "all-media information providers." President Xi Jinping promoted media convergence as a

national media strategy to occupy the public opinion battlefield and to deepen press reform and transformation. As such, only the Party-controlled press groups can provide news content across the different range of media platforms. Nonstate Internet companies, which are dominated by private capital, such as Baidu, Alibaba, Tencent, and Sina, are not licensed to carry original news reporting on current affairs, although this does not stop some of them from doing their own reporting on entertainment or nonsensitive social news.

China's domestic media convergence development parallels Chinese media's global expansion. The "going global" policy was a top agenda item since the 2008 Olympics as the state media expanded worldwide to promote China's soft power and boost its global influence. The embarrassing images revealed in Western media's coverage of protests and conflicts encountered during the Beijing Olympic torch relay prompted an ideological shift among senior Chinese officials, who became painfully aware that China's voice and cultural influence were far from having a global presence the way its economy has. The barrage of negative foreign press reporting reinforced the notion that unfair anti-China bias in Western media persisted. In response, President Xi emphasized the need for Chinese media to take China's voice into the world and present Chinese perspectives on both Chinese and world affairs to a global audience.

In a letter sent to CCTV rebranded as *China Global Television Network* (CGTN) in its 2016 relaunch, Xi urged the Party press to portray a three-dimensional and colorful China to the world, and to showcase China as a responsible international player and a builder of world peace. As of 2018, CGTN broadcasts in more than 100 countries—reaching 30 million homes in the United States alone. It is a multi-language, multi-platform media group consisting of six television channels, including a 24-hour English-language news channel, a video content provider, and a digital media division, with broadcasting centers located in Beijing, Washington, Nairobi, and London as well as other overseas-affiliated institutions. *Xinhua News Agency* now has more than 170 bureaus and delivers its news across the world in at least eight languages, all seeking to present an international vision

with a China perspective. The Chinese government sees the internationalization of Chinese media as crucial to its ability to tell the Chinese story well, to winning hearts and minds abroad, and to serving as a counterweight to unflattering Western media narratives of China and its global ambitions. Though its effectiveness remains to be seen, “going global” is nevertheless at the forefront of an ambitious multilingual overseas expansion as of 2021, and a closer inspection would suggest that China’s Party press continues to seek to broaden the terms of debate in international communication.

China’s press system is embedded within the Party-state, and the CCP continues to pursue a socialist orientation in its press reforms and restructuring process. Over the past 40 years, journalism in China has been guided by a two-pronged rationale of Party principle and market logic. The CCP has nurtured its Party press into market-oriented media conglomerates by selectively liberalizing certain sectors for private and foreign capital. Commercialization of the news media has played a significant role in diversifying the press landscape in China, but regardless of four decades of controlled reform resulting in decentralization, diversification, and increased editorial autonomy within the newsroom, the Chinese press continues to exercise oversight in the name of the people. As such, positive reporting, adherence to the Party line, and an emphasis on social responsibility are the mainstay of today’s Chinese state model of journalistic professionalism. China’s media convergence strategy seeks to maintain the Party press’ commanding heights in public opinion formation, and it sees its “going global” policy as an essential part of China’s drive to reshape world communications and reach a point where China can tell the story of its developmental path toward socialist rejuvenation story in its own terms.

CHINESE TELEVISION

Holding the largest audience in the world, Chinese television has a significant impact on the Chinese society. Chinese television was built in the 1930s on the broadcasting system from the Chinese civil war and was established in 1949 when the People's Republic of China was founded. Media do not stand alone from politics, economics, culture, and society in China. This applies to Chinese television. Chinese television has been evolving with the political, economic, and social revolutions in China since the reform and opening policy launched by Deng Xiaoping in 1978. This entry discusses the development of Chinese television from political, economic, and cultural perspectives and its impact on Chinese society in general.

The Founding of Chinese Television

Established in 1949, when the People's Republic of China was founded, the Central People's Broadcasting Station (CPBS) was developed from Yanan Xinhua Radio, a radio station that had been managed by the Chinese Communist Party since 1940. CPBS was the foundation of Beijing Television, the state network, which was started on May 1, 1958. The national network changed its name to China Central Television (CCTV) in 1978.

In China, the Department of Propaganda of the Chinese Communist Party, the State Council Information Office, and the State Administration of Press, Publications, Radio, Film, and Television (SAPPRFT) were once in charge of the television system. However, since 2018, the newly established National Radio and Television Administration (NRTA) replaced SAPPRFT to closely oversee the Chinese television industry.

As the opening policy prioritized China's economic growth over ideology, the national network (CCTV) shifted its role from the primary

mouthpiece of the party to service and consumer-oriented information provider. These roles are reflected in the changes of ownership structures, business models, and program formats in the national television industry.

One Ownership, Dual Operation Patterns

As a centralized system, Chinese television consists of television stations at the national, provincial, and municipal levels, as well as some closed-circuit community systems. With the marketization of the Chinese television industry, it has evolved into a system with One Ownership—Two Operation Patterns in which politics and market coexist or cooperate. In some cases, commercial interests were found to actively align their own interests to those of the government for the purpose of official profiteering, and commercialization actually worked to enhance propaganda.

The state-owned media capitals achieved rapid growth and dominance through the process of market-oriented reform. For example, in addition to serving as a political apparatus of the Party State, CCTV conducts a massive range of commercial businesses and activities. The CCTV-owned commercial entity, China International Television Corporation, has a complete range of subsidiaries and regular businesses, including notably a theme park in Jiangsu Province known as *Wuxi Movie TV Production Base*. China Global Television Network (formerly CCTV International), launched in 2016, is available in five languages in more than 170 countries in the world. CGTV seeks to bring a Chinese perspective to global news and enhance the global image of China in the world.

Advertising-Supported Business Model

Since the launch of the opening-up policy in 1978, Chinese television relies less and less on governmental funding and more on revenues from advertising while fulfilling its dual political and economic roles.

Since 1979, when advertising came back to life in China, it has experienced rapid and continued growth. Its annual business volume rose at an average rate of more than 40% between 1981 and 1995. Its business volume further increased to

27.3 billion yuan (around \$3.3 billion) in 1997. At the same time, competitions in the media industry have been increasing. To increase its competitiveness, a self-funding structure was introduced into the Chinese television system in 1995. Internal changes in China's television industry have shaped this system's structure into the new millennium. However, after two decades of rapid growth, the advertising revenue started to decline. The annual television advertising revenue in China has decreased from 111.93 billion yuan (around \$18.5 billion) in 2013 to 91.29 billion yuan (around \$12.9 billion) in 2019.

The advertising-supported business model transformed Chinese television from a propaganda tool to a consumer goods display window. Consumer-centered or service-oriented programs became popular. More innovative television programs adapted from Western formats getting close to people's lives—focusing on new consumption trends and lifestyles—were created.

New Formats of Television Programs

The new dynamics of television reform are reflected in policies of decentralization and changing regulation, prompting greater autonomy for television stations. The popularity of television news magazines, talk shows, and documentary television programs in the 1990s reflected the increased autonomy of Chinese television.

CCTV launched news magazines such as *Oriental Horizon*, talk show programs such as *Tell It Like It Is*, and documentary programs such as *Focus Interviews* and *News Probe*. These particular programs were highlights of the transition. The news magazine format differs from traditional news programs in their length and flexibility and their use of a more personalized style, combined with changes of pace and a wider range of faces and voices presented. The television talk show is a creation of 20th-century broadcasting. The hybrid forms of the talk show format originally emerged out of two central traditions: news and entertainment. Over time, the hybrid forms developed with mixed news, public affairs, and entertainment.

News documentaries embrace a live coverage style and in-depth investigations. For example, the goal of *Focus Interviews* and *News Probe*, in particular, was to establish a public sphere on Chinese

television by exposing social scandals, disclosing truths behind certain news events, and promoting social equality and justice. Journalists assume a multiplicity of roles in these programs: an advocate of state objectives, a voice of victims of power abuse and consumer fraud, and a social commentator, condemning what they consider unhealthy social trends and upholding social morality.

In addition to news and public affairs, television provides a wide variety of entertainment and diversion. However, entertainment programming in China used to consist primarily of feature films because of the lack of independent economic interests under the planned economy. The notion that television programs could be made primarily to entertain the masses did not develop until the late 1980s. With market reform, advertising was introduced, and Chinese television transformed from a state-subsidized propaganda operation to an entertainment-oriented mass medium with both propaganda and commercial objectives. Capitalized television companies were able to contribute to financing the content production of the broadcaster as well as to its other core activities. Marketized and partially privatized independent and quasi-independent producers flourished in the late 1990s and produce an increasing share of entertainment programming. CCTV's launch of a regular magazine program, *Life (Shenghuo)*, focusing on new consumption trends and lifestyle in China in 1996, epitomized this change. The Chinese are simply bombarded with entertainment on TV—game shows, competition shows, and celebrity shows. From 2002 to 2013, the State Administration of Radio, Film, and Television, the former regulatory body of SAPPRFT, issued a series of regulatory rules in a Clean Up the Screen campaign.

Digitalization

As noted, as of 2021, Chinese television has the largest audience in the world. It is worth adding that 96% of the potential Chinese audience, equivalent to 566 million people, watched the Spring Festival Eve Variety Show (CCTV) in 1986. However, the audience is transferring from traditional television to online videos due to the growth and widening availability of the Internet. The Chinese Internet has ranked first in the world in terms

of users since 2008, and it has seen rapid and intense expansion. According to the China Internet Network Information Center, an administrative agency responsible for Internet affairs under the Ministry of Industry and Information Technology, as of June 30, 2019, 854 million people in China were Internet users, and 99.1% of them, 847 million, accessed the Internet via a mobile network.

Chinese audiences' consumption behavior is also evolving. Based on the 2019 Global Digital suite of reports from We Are Social and Hootsuite, China has 1.007 billion users of social media and mobile social media. On average, Chinese users spend nearly 6 hours accessing the Internet daily and approximately 2 hours each day on social media. Additionally, short video content is a popular and effective trend used in digital marketing strategies.

The evolution of the Chinese television industry has accelerated due to the rapid expansion of digitalization. Internet, television, and telecom are continuing their amalgamation. New players such as Youku, Tudou, Sohu, Baidu, iQiyi, LeTV, BestTV, PPS, and PPTV are emerging in the Chinese television market. Chinese television broadcasts online and appeals to audience's migration to smartphones, tablets, and web-based applications. To face the challenge of this shift, CCTV launched the China Network Television (CNTV), a Chinese national web-based TV broadcaster, on December 28, 2009. CNTV is affiliated with CCTV and administered by the NRTA. According to the China Media Group, a total of 1.23 billion viewers from China and overseas watched the 2020 Spring Festival gala show, which was broadcast live on television and also screened live online using various digital platforms. With the rise of alternative media channels, audiences' changing viewing behaviors and preferences, and content and privacy protection on the Internet, Chinese television faces new challenges from social media, digitalization, and the globalization of its international counterparts, as well as its peculiar dual tasks for political and economic interests within China.

CIRCULATION

Within the context of journalism, the term *circulation* has traditionally referred to the number of printed newspaper copies issued by a specific news publisher. As such, it was an important measure both for the sale of advertising and for social impact. In addition to a material process of dissemination, such as the paperboys' rounds and the single-issue sales at the news agent, the term thus arguably also carried undertones related to content becoming socially significant through circulation. Linked to that, another and related measure

was also important, namely that of readership. Circulation numbers were for the most part of the 20th century the main so-called currency connecting news publishers and advertisers. In relation to this, the formation of the Audit Bureau of Circulation in the United States and Canada in 1914 was pivotal—as publishers prior to that were more *lenient* or *sloppy* with their circulation numbers. Around this time, the United States also made its full transition into a consumer society, which—along with other developments—boosted not only the number of newspaper titles but also their circulation, which made the market much more competitive. The *Daily News* (New York), for instance, started in 1919 and had after its first year a circulation of more than 100,000 and, by 1925, more than 1 million. It reached its peak in 1947 with 2.4 million daily copies; in 2018, its circulation of print copies had fallen to approximately 200,000, whereas its digital products reached 23 million people. While the total number of circulated newspapers in the United States peaked in the 1980s, the example of the *Daily News* illustrates both the overall decline in circulation and the overall shift in how print news reaches its audiences.

Thus, while the circulation of news in a digital news landscape still refers to the material dissemination and the social significance of content, this has become part of much more complicated processes in terms of movement, measurement, control, and meaning, and this has important implications for both the economic and social aspects of news circulation. This entry consequently highlights some of the most important and interrelated technological, economic, and social aspects of the overall changes in how news is circulated digitally.

The Technological: Unbundling and Connectivity

In the predigital news landscape, news institutions were defined by their materiality of production and distribution. A newspaper was a newspaper because the news was distributed on paper, and a radio news broadcast was precisely that because it was produced for and distributed over the airwaves to a specific material device called a *radio*. The circulation of printed journalism was thus largely bound by the material container of distribution, the newspaper, or the magazine. People

either got the whole thing or nothing—unless, of course, a neighbor came with a newspaper clipping and/or told someone about an article she had read in the newspaper or if one happened to find parts of a newspaper under other circumstances, such as in a café. Given this mode of distribution, maps of newspaper circulation were often closely related to the material infrastructures of roads and other means of transportation. This often meant that the density of circulation fell the farther one moved from a center, often the politically and/or economically important part of a given metropolitan area.

The internet disrupted that in a number of ways. As of 2021, news is also made available through a range of different digital devices connected via an infrastructure through which physical distances and location can be constituted in different ways—such as the global audience of *The New York Times*, the hyper-local news sites that cater to specific neighborhoods or spread-out audiences of specialized business news (e.g., that related to shipping). Still, however, the circulation of news constituting such audiences relies on a material infrastructure of cables, buildings, masts, servers, and consumer devices. Another important development also related to materiality is the process of unbundling, through which entities of content formerly held together by the physical container of distribution, the newspaper, can circulate independently. News articles, columns, letters to the editor, (classified) advertisements, and other types of content also circulate through new and complex trajectories in the digital landscape and such trajectories, more often than not, traverse various social media platforms. As newspapers used to be able to control at least the immediate context in which news circulated, the unbundling process has had implications for the ways in which journalistic content acquires social significance. As newspapers used to rely on the ability to bundle journalistic productions with commercial content, the process of unbundling has had significant consequences for the funding of journalism.

The Economic: Measurements, Control, and Values

The first type of commercial content to move away from newspapers were classified ads, which relocated to sites such as Craigslist in the mid- to

late 1990s—around the same time as the MP3 file started the unbundling process in the music industry, which had relied on the LP and later the CD as its main containers of distribution or circulation. A key reason for classified ads relocating to independent digital platforms was that these offered a more efficient (and cheaper) way of connecting content with appropriate audiences, that is, audiences who were potentially interested in buying what was advertised. It is, generally speaking, the ability of connective platforms on the internet (e.g., Facebook, Google) to make a much more precise match between specific content and relevant audiences. Thus, while most journalism publishers have aimed at relatively broadly defined audiences, for example, politically interested citizens within a given community (e.g., a city), social media can carve out much more specific audience constellations not necessarily related to geographical location and combine these with relevant commercial content. The traditional mode of circulating news, the newspaper, and later the news website thus cannot compete with the efficiency with which social media platforms and other internet services can connect users with commercial content. The news industry has consequently lost an important part of its predigital source of income.

What remains, broadly speaking, are different subscription models. In relation to this, circulation has taken on a new meaning in the sense that a significant amount of journalism content circulates freely on social media platforms in the hope that it may refer users to the publishers' websites, which is only one of the ways in which journalistic content is made available and circulated. The internet is thus full of free samples of journalistic work—some only in parts, others as full productions. As a substantial amount of people mainly or only encounter news through social media sites, publishers feel they need to be there for the sake of visibility, that is, to be where the audiences are, which may or may not convert some into subscribers. In general, however, it has proven difficult for publishers to monetize the circulation of their content on social media. An important element of this is related to the fact that the circulation has become a much more complex process in and out of various platforms. Thus, while circulation remains a measure of value, there is no standard currently through which circulation, and

thus audiences, can be traded as was the case in the predigital system. Another aspect of this is a lack of transparency in the sense that a lot of the data through which circulation can be measured is not necessarily available to news publishers; and, if available, this is in a form determined by the owners of the data. Adding to this lack of transparency is the emergence of automated trading through which content and audiences are linked on a variety of platforms. Compared to a predigital situation where many publishers dealt directly with advertisers, such automatic auctions are rather black-boxed processes. A final aspect is that the measures of circulation and the readership of news have coalesced as digital readership leaves traces of actual encounters between audiences and various forms of content. Readership is thus no longer measured by sampling based on social science methods.

While this on one hand allows automation and personalization—for commercial and/or for diversity/democracy reasons—it also means that audience metrics are much more immediate and detailed, which means that they are used in many newsrooms to determine editorial decisions. In general, one can say that the digital circulation of journalism has brought editorial processes and the market into much closer contact. While some have seen this as a welcome change in how journalism relates to its audiences, it has also raised concerns about journalism's ability to fulfill its obligations to democracy.

The Social: The Merging of Circulation and Consumption

Journalism has always been dependent on its social resonance (i.e., that the news was or became socially significant). News thus depended on being retold, shared, and talked about. A direct following of the unbundling discussed earlier is that people often do not meet news through the particular professional filter constituted by the modern newspaper, which—largely for reasons linked to news criteria—featured the most important stories on the front, after which contents dwindled in their perceived social importance with sports, comics, and crosswords appearing toward the back. When news items are circulated independently through various connective platforms, this happens through what may be termed a social

and/or algorithmic filtering, which does not take place according to journalistic values. Thus, while the construction of social significance related to the circulation of journalism still takes place offline, this is also something that has become increasingly mediated.

The two meanings of circulation, that is, the dissemination of certain containers of meaning, newspapers or the digital object holding an article, and the social processes through which meaning is constituted have, broadly speaking, shifted positions in terms of importance. While circulation in the newspaper landscape mainly referred to *physical dissemination* and *implied social significance*, the order in the digital landscape is almost turned around. Here, circulation is mainly about the social, the interactions, the likes, and the comments, while the actual processes of moving objects through the underlying digital infrastructure have become less focused on. This is partly because news is not disseminated in the old sense but rather simply made available on a website—no trucks or paperboys are needed. News is, however, still disseminated in email newsletters and, to some degree, through broadcasting. Another reason for such processes (i.e., the ways through which certain content appears in some contexts and not in others) not being the focus of so much attention is that they have become partly or almost fully invisible as they happen out of sight through combinations of user data and differently programmed algorithms. The dissemination of news, or a significant part of it, is thus partly out of the hands of the news publishers.

Thus, while one can argue that circulation in the sense of social significance has gained in importance over physical dissemination, one could also say that these two processes have coalesced, that is, that digital circulation is both a material process of dissemination of digital objects and a process of making sense of these objects. Put differently, circulation is at one and the same time circulation and consumption, or circulation happens *through* the consumption of and/or interaction with news. This was to some extent also the case with the newspaper, which—as a mobile object—was passed around among family members, neighbors, and colleagues. And, of course, such processes are still taking place. An

important distinction, however, is that while the postpublication circulation in the analog landscape was fully social, that is, not directly influenced by institutional interest (apart perhaps from the availability of newspapers in cafés and library reading rooms), the processes in the digital landscape are also programmed and thus based on commercial logics that transcend the social and which, in addition, most often are not very transparent.

A like or a comment on a news story in social media thus simultaneously disseminates the news item in various directions, partly based on this particular interaction and partly based on its prior trajectories. This happens in ways that are not fully obvious. One can, of course, observe the results of algorithmic orderings and, through this, try to decipher how underlying criteria are weighed. One can say, however, that the news item as a digital object continuously accumulates social interaction as metadata. These data play into the processes determining where the object appears next. The circulation of journalism is thus increasingly something that happens after publication and/or dissemination—what used to be called *the circulation of news*.

Obviously, news still needs to be made available or circulated before it can be recirculated. But, while journalists in the old media landscape could work in somewhat isolation from its postpublication circulation—apart from letters to the editors, chats in a bar, or published comments from competing publications—this is no longer entirely possible. As a journalistic institution, and as a journalist, it is thus increasingly important to think about circulation not only as a physical process through which content is made available and/or disseminated but also as the ensuing processes through which news may become socially significant. And while the news industry's ability to make money used to be linked directly to circulation in a physical sense—the number of newspapers sold—the industry is, as of 2021, struggling also to monetize postpublication circulation. The irony here is while certain aspects of the social significance of news circulation arguably have grown, such as the ways in which journalistic content is part of the glue that binds communities together, this has not been befitting news publishers.

Highly Intertwined Processes

The technological, the economic, and the social aspects of the digital circulation of news have become increasingly intertwined and thus can only be separated analytically—and even that is difficult. This means that fully understanding such processes from both a practical and an academic perspective requires the coming together of types of knowledge hitherto kept more separate. While the practicalities of circulation used to be dealt with in relative isolation from the production of news content, editors and journalists are increasingly faced with issues of circulation in their daily routines. And while journalism scholars interested in the social significance of news could assume somewhat uniform meetings between texts and audiences, they are now confronted with a complex landscape of highly diversified mediations of news, each of which has come about for a variety of reasons and thus potentially produce very diverse meanings. Understanding such processes necessitates much more than the ability to analyze texts and interview their real or intended recipients. Thus, moving forward, when consumption and circulation coalesce, an adequate understanding must combine knowledge about technology, economics, and social processes.

CITIZEN JOURNALISM

Citizen journalism is a term used to refer to the contributions of individuals not employed by news organizations to the reporting, analysis, and dissemination of information of public interest. The term came into wide use in the early 2000s, when the prominence and frequency of contributions by ordinary people to news reporting garnered public attention and prompted academic inquiry.

While citizens—a term used here loosely to mean nonprofessionals, rather than people possessing a particular legal status relative to a nation-state—had long contributed to journalism both directly, through letters to the editor, as sources for reporters, and in other ways, and indirectly through the choices they made as media consumers, the spread of new technologies in the late 1990s and early 2000s enabled many more to contribute more easily to news content. Those contributions took many forms, ranging from pictures or videos recorded by witnesses of disasters or incidents of things like police violence, to bloggers maintaining a regular update of local news, to crowdsourced efforts organized by professional journalists. This entry discusses the history of citizen journalism, terminology associated with it,

and the relationship between citizen journalism and professional journalism.

History

Citizens had been involved in journalism in various ways since long before the interest in what came to be called *citizen journalism*. Before the existence of a profession of journalism, most publishers of newspapers did not engage in the kind of fact-based reporting that characterizes professional journalism today. At the same time, citizens and activists have a long history of creating media that might be called *alternative media* but in many ways resembles activities labeled as *citizen journalism* today. Local newsletters and other nonprofessional information-gathering and sharing could have rightly been called *citizen journalism*. The professionalization of the press, and the creation of journalism schools and professional societies that took place in the early 20th century led to a distinction between professional journalism practiced by journalists working for certain kinds of publications and amateur activities or things that were deemed not to qualify as journalism, including advertising and public relations. Much of this effort at distinguishing professional journalism from other kinds of information was done by professional journalists who sought to set their work apart; these efforts are described as boundary work.

Professional journalism had established a strong understanding of the work that they do, adopted ethics codes, and set themselves as gatekeepers of public information by the end of the 20th century. While scholars and critics may have raised concerns about the legitimacy of those gatekeepers, ethical lapses by journalists, and other issues, the idea of a professional journalist had been well-established. However, many of the claims to authority over information were based on access to technology and control of the means to distribute information. To print a newspaper required a printing press and the means to arrange, print, and distribute papers. Radio and television journalists had even more control over the dissemination of content through those media, which required licenses, aside from the extremely expensive technology that was needed to record and broadcast information.

Those conditions began to change with several advancements in technology that were happening at the same time. The widespread adoption of the internet gave every user access to tools to disseminate written information with relative ease, and even pictures and video. Advances in camera and video technology made those tools more affordable and improved the quality of images that amateurs could capture. The integration of cameras into cell phones and the widespread adoption of phones as well as increasing connectivity of those phones to the internet and data services took these possibilities a step further. When many people began carrying in their pocket tools to capture and share pictures, text, and video, it created the opportunity for *accidental* citizen journalists who happened to witness an event of wider importance and then used those tools to report it. At the same time, the introduction of blogging platforms and other WYSIWYG (“what you see is what you get”) sites made it possible for internet users who did not have coding skills to create and post content online more quickly and easily, and without creating and paying for their own domain names. This kind of expansion of the number of people who could contribute to news and information led to declarations that everyone could be a journalist.

The earliest examples of the kinds of activities that drove interest in citizen journalism in the 2000s were a mix of the organized actions and one-time individual efforts that would come to characterize citizen journalism, as well as confusion about the term, over the following decades. Activists at the 1999 World Trade Organization meetings in Seattle were disappointed in the legacy media coverage of protests and launched the Indy Media Center to generate their own version of events. Other instances of citizens witnessing newsworthy events and capturing them included photographs and video of the World Trade Center attacks on September 11, 2001, the December 2004 tsunami in Southeast Asia, and the London Tube bombing in 2005. In disasters or events of that kind, people who are already on the scene are able to provide photos, videos, and personal accounts before professional journalists even arrive. By the time of the London Tube bombing in 2005, professional journalists had begun to recognize the potential for citizen journalists to

contribute to reporting, and the BBC received 1,000 pictures, 20 amateur videos, 4,000 text messages, and 20,000 emails from people sharing their experiences of the event.

One of the most prominent examples of citizen journalism predated cell phones with cameras: George Holliday, a Los Angeles man who in 1991 looked out his window and saw what looked like four Los Angeles Police Department officers beating a man, took out his VHS video recorder and began filming and gave the video to his local broadcast news station. The footage was aired on broadcast news stations in Los Angeles and led to a public outcry. The four officers involved in the beating of Rodney King were indicted, but eventually acquitted, a result that sparked protests in part because the video had been widely seen by the public.

The prominence of this early example of a citizen witness contributing to a story of public interest established a pattern and a dynamic in the public imagination that has been replicated many times over. Videos of police shooting unarmed victims were recorded by citizens in many other high-profile cases. The fatal shooting of Oscar Grant by a Bay Area Rapid Transit officer on a train platform in 2009 was one of the most notable examples of this. At least half a dozen people on the crowded train recorded the shooting from different angles, and the videos were shared on YouTube and broadcast on television news. Among many other examples, the aftermath of the police shooting of Philando Castile during a traffic stop in 2016 was recorded and shared by his girlfriend as she sat next to him in the driver's seat of their car, and the choking of Eric Garner by police in 2014 was recorded by a bystander on their cell phone.

Some sites attempted to harness the efforts of citizen journalists, creating sites whose information content was entirely or mostly created by contributions from users. The South Korean site OhmyNews was launched in 2000 as a site to accept, publish, and edit stories submitted by readers. The site's motto, "Every Citizen is a Reporter" was representative of the attitude of many citizen journalism sites. In 2006, the American cable news network CNN created an area on the CNN website called *iReport* that accepted citizen journalism submissions and even

provided a vetting process for some stories. Many local and community-run news sites were launched on the basis of citizen contributors or began inviting stories from citizen journalists as a way to increase content and include more voices.

Public, and even academic, interest in citizen journalism was either subsumed or overwhelmed by interest in social networking sites and social media in the 2010s. Many of the capabilities that had been extended to more of the public by the internet and the adoption of smartphones were also available on social media and were made even more simple. Creating a profile on the most popular social media sites, especially Facebook, was even easier than creating a blog and required less effort to reach an audience; the network of friends on the site provided an automatic audience for content that blogging sites could not. Posting content was equally easy, or even more so. Many of the possibilities for democratization of information that enthusiasts of citizen journalism had touted were seen as even more likely on social media. Twitter was celebrated for its role in empowering citizens to organize protests and share information about protests and social movements, particularly during the Arab Spring and later in the case of the Black Lives Matter and #MeToo movements to create awareness about, respectively, police and vigilante shootings of Black people and about sexual harassment and sexual assault.

Social media sites have become a source of news and information for many people in the United States and around the world. On social media news feeds, links to news stories produced by professional journalists appear alongside posts or commentary created by friends and acquaintances or just other users, some of it related to public information, and some of it disinformation or misinformation. It is unclear, however, how many social media users are practicing citizen journalism or consider themselves to be citizen journalists or whether that term has relevance in social media. One marker of the transition from citizen journalism to social media was the shuttering of CNN's *iReport*, which was replaced only by a hashtag (#ireport) with which users can mark stories for attention by CNN's *iReport* editor.

Terminology

It is important to note that the term *citizen journalism* has been used to refer to several different activities, and the way it is used has sometimes made it unclear what distinguishes it from other forms of participation in journalism by the audience, including contributions to activist newspapers and neighborhood newsletters or crowdsourced reporting. Participatory journalism, in which citizens are encouraged to contribute to projects, is quite distinct from the random acts of citizen journalism that happen as a result of a witness catching something newsworthy. Participatory journalism projects are organized either by professional journalists or others acting as gatekeepers or coordinators who invite members of the audience to contribute to the reporting or fact-checking or construction of a report.

Examples of participatory journalism include *The Guardian* (UK)'s crowdsourcing effort in which journalists posted hundreds of thousands of documents on their site and asked readers to help sort through them, and Talking Points Memo's posting of Department of Justice documents related to the politically motivated firing of lawyers. In these cases, citizens are involved in the reporting process, but control over the selection of stories and ultimately the editing and framing of the story remains in the hands of professional journalists. Participatory journalism could be considered a kind of citizen journalism but is distinct from the reporting of citizens who act autonomously.

Public journalism, or civic journalism, similarly maintains journalists as gatekeepers, moderators, or editors of the process but involves citizens more actively in the identification of stories that journalists will report on. Public journalism involves more reimagining of the role of professional journalists rather than giving citizens more of a role in reporting or spreading their own information. Advocates for the adoption of public journalism suggested that professional journalists should act more as interested advocates for the improvement of society, organizing town halls and focus groups to identify stories of interest to the public. This would not qualify as citizen journalism, despite its value to the public and its basis in civic life.

Crowdsourcing and user-generated content are other terms that might apply to journalism or

news and information but are not exclusively applicable to journalism. Crowdsourcing refers to leveraging the power of a large group of users to complete tasks. It can be utilized in participatory journalism projects. User-generated content is a broad term that describes all content created by users of social media and any other online sites. Citizen journalism could be considered to be one of the categories of information created under the umbrella of user-generated or user-created content, but as a whole, user-generated content is not necessarily newsworthy or informational in nature. Two less commonly used terms, *guerrilla journalism* and *street journalism*, more closely resemble several of those notable examples of amateurs in the street attempting to gather and share information in their neighborhoods and cities and would certainly fit under the umbrella of citizen journalism.

Finally, there is the problematic nature of the term *citizen* itself because of its implications about a particular status relative to a nation-state. Besides the fact that not all people sharing newsworthy information online are legal citizens of the country where they live, in a global media context online, it is not especially relevant whether an individual is a legal citizen of any nation-state. The term *amateur journalist* is similarly problematic, for different reasons. The term *netizen*, coined by Michael Hauben in 1997 and commonly used in English-language media in China, may be more appropriate, but it is not widely used in the rest of the world. *User* as in user-created content or social media user does not provide enough information about the way the person sharing the information differs from a professional journalist; all professional journalists are also users of the media they produce and consume.

Citizen Journalism and Professional Journalism

The relationship between citizen journalists and professional journalists has been fraught, varied, and inconsistent. There is a degree of ambivalence evident in studies of practitioners on both sides of the divide. On the one hand, professional journalists have often sought to distance themselves from citizen journalists, diminishing the credibility, legitimacy, and professionalism of citizen

journalists, and suggesting that the lack of editorial oversight, accountability, and ethics codes makes citizen journalism unreliable. On the other, many professional news organizations have invited and encouraged contributions from citizens. Almost all permit some level of contribution by nonprofessionals, for example, allowing readers to comment on news stories.

Some professional journalists responded to the citizen journalism movement by pointing out the failings of citizen journalism. They pointed to cases such as false tweets about the death of Steve Jobs that caused a drop in Apple stock as evidence that citizen journalists were unreliable and even dangerous. There were some who questioned the quality of the information and the ethical standards of citizen journalists, while others expressed more concern that citizen journalists could not be relied upon to regularly show up at city council meetings and do the work necessary to keep their fellow citizens involved. There were a few professional journalists who celebrated or sought out these kinds of contributions, but they were not common.

One aspect of the challenging relationship between professional and citizen journalism is financial. Critics have pointed out that citizen journalism-produced content is free, but that means the people who create the content are sometimes exploited by sites that profit from advertising shown alongside citizen journalism-produced content. On social media, this dynamic is even stronger. At the same time, this content that is effectively *free* to the audience competes for attention and advertising revenue with legacy media, which is relatively expensive to produce. Professionally produced content is also used, whether linked, cited, or reappropriated by the audience, with no compensation for the original creator of the information. Professional journalists' articles cost some amount of money to produce but then can be used by citizen journalists to create content that is free. This not only undermines the revenue of the legacy media but also contributes to the general public's sense that information is, or should be, free. This is especially problematic as advertising revenue has been depleted over the last few decades, forcing several daily newspapers to close or move to online-only publication.

Some scholars argue that the use of the term *citizen journalism* to refer to contributions by individuals who are not employed by legacy news media organizations sets up a dichotomy that is not particularly helpful and relies on outdated distinctions that are irrelevant in a digital media world. It might also be viewed as granting more authority or legitimacy to professional journalists and the information they produce. While it could rightly be argued that professional journalists are held accountable for their content and adhere to ethics codes and are subject to oversight by editors and fact-checkers, it is overly simplistic and unhelpful to assume all the content they produce is automatically superior to that produced by citizen journalists.

Some scholars have suggested new ways to conceptualize the process of newsmaking and the contributions by various actors in the system. Axel Bruns in 2008 coined the term *produsage* to describe the user-led process of creating content online and detailed the ways the process of information produsage differs from more traditional models of information production, including open participation, ad hoc meritocracy, and the idea of *unfinished product*, meaning that the content that comes out of produsage is never finished, but always subject to further revision and development. Sue Robinson (2011) described the participatory creation of online news as "journalism as process," an ongoing effort to create and shape news that begins with a report published by a professional journalist and continues online through the audience response, criticism, and the addition of further information or context. This view positions professional journalists not as the ultimate authorities on news and information, but as fact-gatherers and fact-checkers who present their work for analysis and dissemination by an active audience. Whether the members of that audience should be considered or called *citizen journalists* is perhaps not as important as the levels of media literacy they have and the effectiveness of their participation.

Proponents of citizen journalism argued that the practice would result in the production of news and information that was more representative of the broader public and would make more salient issues and voices that had been ignored or underreported by the legacy media. Others praised

the more active involvement of citizens in journalism as good in and of itself. While skeptics pointed out that participation in citizen journalism and other categories of user-generated content is not even, and those who are already on the other side of the digital divide are further marginalized in participatory information environments, it is nonetheless true that citizen journalism allowed more people to be involved in the selection, analysis, and dissemination of newsworthy information than traditional or legacy media. As technology and information media continue to evolve, citizen journalism may become more relevant again as a way to conceptualize the powerful role every individual plays in shaping information or may fade completely as the understanding of journalism and newsworthy information changes and the distinctions among information-creators require new definitions and conceptualizations.

CIVIC JOURNALISM

The journalistic concept of "civic" (or "public") journalism is multifaceted. It simultaneously represents (1) an argument about the role and responsibility of journalism in a democratic society, (2) a set of practices that have been tried in actual newsroom settings, and (3) a movement of individuals and institutions concerned about strengthening journalism's contribution to public life. Following this tripartite distinction, this entry outlines public journalism's basic argument, describes how public journalism is practiced, and considers the individuals and institutions most responsible for its development as a journalistic reform movement.

Public journalism's broader journalistic significance lies not only in having inspired hundreds of newsroom experiments in the United States and elsewhere but also in having prompted much debate among scholars and journalists alike about journalism's fundamental mission. Indeed, public journalism's challenges to mainstream journalism continue to reverberate throughout the profession, notably in discussions about the need for a more citizen-oriented form of journalism.

Basic Argument

Central to public journalism is the underlying argument that journalism and democracy are intrinsically linked, if not mutually dependent. While scholars and journalists acknowledge that the practice of journalism depends on certain democratic protections, most notably freedom from government intervention, they maintain that democracy depends upon journalism that is committed to promoting active citizen participation in democratic processes. Mainstream journalism's failure to encourage citizen participation,

advocates argue, has contributed to widespread citizen withdrawal from voting as well as declining civic participation in community affairs. It also has contributed to declining public interest in, and perceived relevance of, political journalism, as evidenced by declining newspaper readership. Put differently, advocates perceive contemporary society as being split by two widening (though not yet irreversible) gaps: between citizens and government and between news organizations and their audiences. To help reduce those gaps, advocates argue that journalists should inspire increased civic commitment to, and active participation in, democratic processes.

To further such democratic ideals, advocates argue that journalists must change the ways in which they have perceived the public and their own role in public life. Instead of seeing the public as passive spectators who only seek news to be entertained, or even as consumers who watch or read news to learn about government officials, experts, and other elite actors, journalists should perceive the public as engaged citizens who are concerned about active democratic participation. Implicit in this argument is the claim that mainstream journalism's tendency to focus election reporting on campaign-managed events, candidate strategies and image management techniques, horse race polls, or scandal coverage positions the public as mere spectators to a political spectacle. At best, mainstream journalism's efforts to inform the public about actions by the political elite suggest that the public need not be actively involved.

Second, and equally important, advocates argue that journalists need to reconceptualize their own role in public life. Instead of perceiving themselves as disinterested or neutral observers who occupy a privileged position detached from other citizens, journalists should be political actors or fair-minded participants who care about whether public life goes well. Implicit in this argument is the claim that journalism's virtually exclusive focus on the perspective of elite actors has distanced news people from concerns of ordinary citizens.

While public journalism is a relatively recent notion (scholarly and practical writing on the topic date to the early 1990s), its basic argument has deep historical roots. It emerged as a salient topic in a famous debate about the role and responsibility of journalism in a democratic society between journalist Walter Lippmann and philosopher John

Dewey in the 1920s. Public journalism's underpinnings can also be traced back to the reports of the Hutchins' Commission on Freedom of the Press in the late 1940s as well as to several theoretical and empirical works on deliberative democracy a half century later. Aside from these influences, an immediate historical "cause" of public journalism was the much-criticized news coverage of the 1988 U.S. presidential election between the senior George Bush and Michael Dukakis. While the news coverage focused overwhelmingly on the candidates' personalities, strategies and tactics, and horse race polls, the candidates themselves used simplistic image management techniques to appeal to voters, as exemplified by television advertisements featuring Bush visiting flag factories to show his patriotism and Dukakis climbing aboard a tank to show his tough stance on defense policy. Following the election, scholars and journalists alike, many of whom subsequently became advocates of public journalism, called for radical changes to election reporting, notably a move away from candidate strategies and tactics to a focus on substantive policy issues of concern to voters.

Practical Manifestations

Although much has been said in favor of public journalism, the notion is defined more clearly by practice. In contrast to its advocates' rather general pronouncements about what public journalism should be, many journalists have engaged in practices clearly different from those of mainstream journalism.

Public journalism is best understood as a series of experiments that emerged within the mainstream U.S. news media in the late 1980s and early 1990s. Since 1988, when the first public journalism initiative was launched by the Columbus, Georgia, *Ledger-Enquirer*, more than 600 such initiatives have been carried out across the United States and elsewhere. Newspapers have conducted most initiatives—more than 300 dailies, or about one-fifth of all daily newspapers in the United States, have been involved with one or more public journalism initiatives. Similarly, while most of these initiatives have been carried out by individual newspapers, more than 160 (about one-quarter of all initiatives) have included partnerships among newspapers, television, and radio stations.

While public journalism initiatives exhibit different characteristics, these initiatives can be grouped into three categories: (1) elections, (2) special reporting projects, and (3) efforts to make public journalism an integral part of routine journalism practices. During local and national elections, news organizations practicing public journalism have made efforts to focus their reporting on problems of concern to voters rather than on candidate agendas. This has included identifying voter concerns through telephone surveys, in-depth interviews, and focus group discussions; elaborating on the opinions of voters and how they differ from those of candidates; soliciting voter questions to candidates and publicizing candidates' answers; facilitating social interaction among voters and candidates in the form of town hall meetings; and reporting the outcomes of those voter-candidate encounters.

Although election initiatives were an early and visible example of public journalism, they account for only about 10% of the effort to date. Most initiatives have focused special reporting on problems of community concern. Since the early 1990s, news organizations practicing public journalism have engaged in a wide variety of reporting on such problems as racism, educational inequality, and poverty. As with election initiatives, news organizations have used various information gathering methods to identify problems of concern. They have reported on those problems from the perspective of residents rather than government officials and other elite actors, offered residents opportunities to articulate their opinions, elaborated on what residents can do to address given problems, and helped organize roundtable discussions, community forums, and local civic organizations.

Aside from such project-based initiatives, news organizations have also sought to make public journalism an integral part of their routine practice. Some news organizations have restructured newsrooms from conventional beat systems to focus instead on geographic- or topic-based teams. Other news organizations have met with residents on a regular basis to discuss which problems they would like to see covered, report on those problems, and encourage residents to evaluate their coverage.

Sources of Support

Several individuals and institutions have helped ensure that public journalism has been one of the best organized social movements inside American journalism. Public journalism efforts can be traced to 1987 when James Batten, then-CEO of Knight-Ridder (purchased by McClatchy in 2006), instituted a company-wide initiative known as "Community Connectedness," to strengthen the relationship between its newspapers and their local communities. When Batten learned of the Columbus, Georgia, *Ledger-Enquirer's* efforts to involve local residents more actively in community affairs through its "Columbus Beyond 2000" initiative, he appointed the *Ledger-Enquirer's* then-editor Jack Swift "Editor-of-the-Year." Knight-Ridder owned many of public journalism's earliest practitioners, including the *Akron Beacon Journal*, the *Charlotte Observer*, the *Columbia, South Carolina, State*, and *The Wichita Eagle*.

As he was being lauded, Swift contacted the Kettering Foundation, which works to strengthen democracy in the United States and elsewhere. Kettering introduced him to Professor Jay Rosen of New York University. Rosen and the Kettering Foundation played key roles in the development of public journalism as a journalistic reform movement. Aside from influencing the nascent movement with his writing, Rosen helped establish (with a grant from the Knight Foundation) the Project on Public Life and the Press at New York University. Led by Rosen and Lisa Austin, a former journalist from *The Wichita Eagle*, the project operated from 1993 to 1997, documenting early experiments in public journalism. Since the early 1990s, the Kettering Foundation has helped support public journalism by publishing books and awarding fellowships to scholars and journalists from around the world interested in learning more about the movement.

In 1993, the Project on Public Life and the Press was joined by the Pew Center for Civic Journalism (funded by the Pew Charitable Trusts) to strengthen public life in the United States. The Pew Center for Civic Journalism emerged as the most important institutional vehicle for the public journalism movement with a decade-long initiative set in motion by Ed Foully, a nationally renowned former CBS producer and its first

president, and Jan Schaffer, a Pulitzer Prize-winning editor from the *Philadelphia Inquirer* who became president when Ed Fouhy stepped down in 1998. From 1993 to 2003, the center supported the movement by organizing numerous workshops for editors and reporters. At the same time, it funded more than 120 newsroom experiments in public journalism and publicized the most innovative of those experiments through its “James K. Batten Awards for Excellence in Civic Journalism.”

Moreover, the Pew Center for Civic Journalism complemented the work of the Project on Public Life and the Press by reaching out to commercial broadcasters, including funding numerous multiple media partnerships among press and broadcasters, and with workshops for news directors, producers, and reporters at National Public Radio and the Public Broadcasting Service. Finally, the Pew Center for Civic Journalism was an early supporter of the Civic Journalism Interest Group (formed in 1994 and renamed the Civic and Citizen Journalism Interest Group in 2006) of the Association for Education in Journalism and Mass Communication, the premier scholarly journalism association in the United States. This interest group remains one of the most important sites for journalism scholars, educators, and practicing journalists to assess the theory, practice, and teaching of public journalism.

After the Pew Center for Civic Journalism closed in 2003, the Public Journalism Network, a global professional association of scholars and journalists committed to public journalism, continued much of its work. The network cosponsored various workshops in collaboration with the Civic and Citizen Journalism Interest Group, produced publications on the theory and practice of public journalism, served as a forum for the sharing of curricular and instructional innovations in the teaching of public journalism, and maintained a weblog with continuously updated information about public journalism initiatives around the world.

CIVIL UNREST, COVERAGE OF

Since 2010, there has been a global rise in protest activity. From the Arab Spring to the #MeToo movement to Black Lives Matter protests, bouts of civil unrest are occurring more frequently and with more widespread participation. Born from grievances, inequalities, and social discord, protest and contentious politics are viewed as outside institutionalized forms of politics, despite their First Amendment protection in the United States. While participation in civil unrest—whether through on-the-ground demonstrations or online activism via social media—is on the rise worldwide, most of what people know about protest activity stems from the way events are represented in the media.

This entry first discusses factors that influence news coverage of civil unrest, the importance and impact of that coverage, and some common narratives and devices used in protest coverage. It then looks at differences in how the news media cover different types of protest movements and the consequences of those differences. Finally, the entry discusses how the use of social media has influenced protests and protest coverage.

Before the rise of social media in the early 2000s, the public's familiarity with protests and social movements was primarily limited to mediated exposure determined by what the mainstream media considered newsworthy. Today, though, the ubiquity of social media has expanded protesters' reach, exposing ordinary users to first-hand accounts from protesters at the center of the unrest. Importantly, our perceptions of social movements and protests, and our willingness to support or even actively participate in such actions, are interwoven with the way civil unrest is represented in the media.

Behind most civil unrest is a broader movement that addresses social injustices or grievances that affect a sector of society. Protesters and dissenters fall under the same First Amendment protections as the press. Like elected politicians and appointed political actors, the people behind social movements are legitimate actors in politics, and they often work to raise awareness and influence public opinion and policy. For social movements, civic and political support is required to advance their agendas and causes. Without the support of the people and the electorate, political and policy changes are difficult. Media coverage is a crucial component of advocacy and helps movements gain exposure and opportunities to signal the tenets of their grievances and demands.

However, movements often struggle to attract mainstream news coverage without some kind of newsworthy event. For journalists, the day-to-day operations of social movements usually do not have obvious news value in the way that crime, conflicts, and other dramatic events do. So, if social movements want to get the media's attention in order to get their message out to the public, they must engage in dramatic actions that involve a large number of people or create some kind of disturbance or emotional appeal, such as mass demonstrations, sit-ins, or vigils. These events fulfill many of the news values needed to grab the attention of journalists and editors, and as a result, social movements get press coverage.

However, getting the media's attention is a double-edged sword. When movements can get coverage, the press's reliance on traditional norms, values, and routines often ends up working against the movement. Mainstream news coverage tends to follow a pattern that delegitimizes, criminalizes, and

trivializes protesters by emphasizing superficial or sensational aspects of a movement at the expense of the movement's underlying demands and grievances. Journalists pay significant attention to protesters' emotions, crowd size, and the novelty of protester actions. For some protests, especially those that challenge the ever-shifting tenets of the status quo, news coverage highlights violence, disruption to society, confrontation with police, and the oddity of protesters.

Protesters' voices also often are lost in news coverage. Because of reporting norms, official sources typically are granted more credibility and afforded more space than protesters and movement leaders. Police reports, official government officials, and politicians thus get the upper hand of the narrative, and their message is therefore given more legitimacy than that of the protesters. Further, because journalists are accustomed to relying on spokespeople to give them official statements, they often assign authority to a particular protest organizer as a movement's leader, which can contribute to fissions within that movement. All the while, the grievances and agendas of the social movement and the protesters are marginalized, deflating the legitimacy and signaling capacity of the movement. Negative, demonizing, and delegitimizing coverage can depress movement progress, hinder public support, and thereby help maintain the status quo. This pattern is described as the protest paradigm and undermines the substance and issues that underlie civil unrest.

Common Press Narratives and Devices

Media framing refers to the way journalists routinely emphasize certain aspects of a story over other aspects. In many ways, these frames and the patterns in which they appear are products of the news routines and values that drive the journalism profession. In the context of civil unrest and protests, media frames serve to delegitimize or legitimize the social movement behind the collective action effort. Key delegitimizing frames include the riot, confrontation, and spectacle frames. The riot frame is characterized by an overemphasis on the protests' disruption of society. The riot frame includes devious behavior, violent activity, and looting, as well as the nuisance of protesters and their disruption of everyday life for citizens

and bystanders who are potentially inconvenienced by the protests. The riot frame also positions protests as a threat to democracy rather than an essential part of the political process.

The confrontation frame emphasizes the protesters as combative and engaging in conflict with another protest or entity. The press usually evokes the confrontation frame by focusing on “clashes” between protesters and police. However, the confrontation frame also includes narratives of conflicts between protesters and the opposition or counter-protesters. Like the riot frame, the confrontation frame emphasizes protesters’ actions over the substance of their agenda.

The spectacle frame is another delegitimizing frame that focuses on sensational rather than substantive aspects of protester activity. In many cases, this emphasizes the circus-like, spectacular tactics and behaviors that are ultimately employed to attract attention. These tactics include provocative dress, dramatic signs, or unusual or odd behavior. In the 2020 civil rights protests in the United States that followed the death of George Floyd in Minneapolis, Minnesota, coverage of protesters in the nude fell within the spectacle frame. The spectacle frame also includes an emphasis on superficial involvement by celebrities.

The key legitimizing frame used to understand press contribution to the protest paradigm is the debate frame. The debate frame centers on the protesters’ demands and rationale for protesting. It situates protesters in the context of the grievances that sparked the protest and discusses the goals, agendas, and progression of the cause behind the protests. The debate frame serves to place the substance of the movement (rather than its actions alone) into the public discourse. This frame should not be read as one that supports social movements or protesters’ actions, but as a frame that acknowledges protest as a valid, legitimate, and valuable part of the political and democratic process.

Specific devices drive each of these paradigmatic frames, which in turn can have varying impacts on audiences. Terms such as “riot,” “mayhem,” and “chaos”—words used uncommonly in other contexts—are powerful and can falsely assign blame to the protesters themselves for the consequences of protesting and unrest. Coverage

also often underemphasizes police behavior during protests—if it is even mentioned at all. The lack of attention paid to police actions makes other common phrases problematic, such as “clash.” Headlines like “police and protesters clash” with articles that de-emphasize the role of the police also delegitimize coverage. Likewise, use of the passive voice to describe police actions against protesters (i.e., “protesters were hit with tear gas”) and active voice to describe protesters’ actions against police (i.e., “protesters threw bottles”) also serves to delegitimize protesters by blaming them for their actions as well as the police’s actions.

Front page photographs can also drive specific frames and have lasting impacts on how news audiences remember and understand protest events. Images of fires, vandalism, and smoke from overnight protests often appear more frequently than images of peaceful protests, again creating sensational and superficial understandings of what the protest looked like.

Differences in Protest Coverage

The protest paradigm and these negative patterns of media coverage are most easily identifiable and stable among movements that radically challenge the status quo. Although the parameters of what is (and is not) the status quo can fluctuate, in the context of societal power relations, some of the most consistent factors of the status quo include white supremacy, patriarchy, and ableism.

Anti-Racism Protests

The patterns of the protest paradigm have long played out in coverage of anti-racism protests. News media coverage of the 1960s U.S. civil rights movement marginalized Black protest through both demonizing coverage and indifference. Journalists were accused of instigating violence and bombarding national audiences with riot coverage, while also failing to cover Black communities in other contexts. When Martin Luther King, Jr. was murdered, protests—and police backlash against protesters—were seen around the nation, thanks in part to the growth of television. In an effort to better understand what led to this moment, President Lyndon B. Johnson created the

National Advisory Commission on Civil Disorders. The final report of the commission, known as the Kerner Commission for its chairman, Illinois Gov. Otto Kerner, found that the media played a significant role in creating and maintaining racial divides that contributed to the unrest. The report concluded that coverage saw Black people and communities through a white gaze that reinforced negative stereotypes and ignored essential issues.

The same pattern of negative coverage identified by the Kerner Commission continued well into the 21st century when it comes to media portrayals of modern anti-Black racism movements, such as Black Lives Matter. For example, mainstream coverage of the protests that followed the death of Michael Brown in Ferguson, Mo., was dominated by demonizing and marginalizing coverage. Looking back on their coverage, even some journalists have admitted that their stories falsely made it sound like all of Missouri was burning in a race riot.

Importantly, racism against Indigenous peoples and Indigenous rights movements are rarely covered in the mainstream press, pushing their issues out of the spotlight and stifling the potential for the general public to better understand the issues their communities face. National coverage of the protests against the Dakota Access pipeline beginning in 2016 generally fit into the protest paradigm and was primarily demonizing and delegitimizing, rarely including the voices, demands, and grievances of the protesters or the Indigenous community.

Feminist and Sexuality/ Gender-Related Movements

Feminist movements around the world are typically considered nonthreatening; women's voices struggle to make headlines unless they engage in dramatic acts, but that leads to coverage that can mock the movement's goals. After the 2016 inauguration of U.S. President Donald Trump, the 2017 Women's March was a transnational effort to advocate for women's rights. The coverage touted the massive crowds as peaceful and positive, elevating and legitimizing the effort. Still, some news stories focused on spectacular elements—such as knitted pink caps—more than they did protesters' goals.

Coverage patterns of some LGBTQ protests and demonstrations also tend to be relatively legitimizing, though the sensationalism that accompanies the spectacle frame appears frequently. Further, the movement is mostly absent from coverage outside of Pride marches. Protests that consider intersectional perspectives, like the #sayhername protests that took place in 2020 to commemorate Black women who had been killed or injured by police, also struggle to get frequent and recurrent coverage.

Immigration Rights

Also starting in 2017, the Trump administration's changes and proposed changes to immigration policies, such as building a wall on the border with Mexico, prompted a wave of immigrant rights protests. Historically, immigration protest coverage often has included demonizing frames that made protesters seem unpatriotic or anti-American, thereby delegitimizing their demands. Importantly, demands have gone underreported in the past.

Status Quo Protectors

Attempts to protect the status quo can also lead to civil unrest. Pro-white supremacy protests and anti-feminist protests are particularly active in this regard. For example, though initial coverage can deceptively look to fulfill a liberal agenda, several research inquiries have shown that fundamentalist and evangelical movements are treated favorably in the mainstream media. Extremely conservative movements also receive more legitimizing coverage, a pattern that has been identified globally. In this scenario, once protesters are able to formulate clear grievances and demands, the press legitimized their efforts. Importantly, news organizations that take clear political stances often are seen as adversaries to conservative movements. But journalism industry norms, routines, and the commitment to objectivity eventually lead to more legitimizing coverage than other protests are afforded.

Consequences of Coverage Differences

Importantly, the status quo shifts, and over time, so do coverage patterns. Reinvigorations of social movements that advocate for human rights,

women's rights, racial justice, environmental justice, and political reform appear more frequently on the front pages now, and protests have become more normal in the news cycle and in the minds of the public. Differences in press coverage across protest type contribute to what is known as a hierarchy of social struggle, where press narratives prioritize and legitimize some issues more than others. In the United States, anti-racism protests seem to regularly fall to the bottom of that hierarchy, where news coverage emphasizes significantly more the actions of protesters than the substance of the movements for racial equality. This low position in the hierarchy of social struggle not only stifles social progress for some movements, but it can also create divisions between movements and hinder moments of solidarity and intersectional considerations, further contributing to the slow progression of multidimensional social issues.

Non-Mainstream Media

When it comes to legitimizing coverage of civil unrest, alternatives to the mainstream, such as activist, community, and grassroots media, tend to unravel the protest paradigm. News coverage from various outlet types that deviate from the designation of the mainstream—like emerging news organizations that exist online, or alternative and ethnic media—typically cover social injustices, civil unrest, and collective action more frequently and sympathetically. A study of coverage of the Arab Spring showed citizen journalist efforts adhered less to the paradigm than did those of *The New York Times*. For coverage of Black Lives Matter protests, alternative media outlets, as well as digital-native outlets, also tended to publish more legitimizing coverage on social media than traditional mainstream media. Advocacy media and social justice journalism prioritize the voices of advocates, activists, and affected communities. In addition, coverage often elevates the importance of the substance of a movement, provides nuance, and discusses ideas and solutions for problem-solving and social progress.

Civil Unrest in the Age of Social Media

Since the 2010s, it has become hard to imagine a protest without social media. Although the label

“Twitter revolution” that was applied to protests during the 2010-2011 Arab Spring has come to be seen as hyperbole, researchers acknowledge that social media, alongside traditional media, are now integral spaces for broadcasting social grievances, generating unrest, and aiding social movements.

Twitter, in particular, has become a medium for many movements to mobilize supporters and create a sense of collective identity. Like many social media platforms, Twitter is free. Conversations can be linked through hashtags; mobilization information can be connected with communities around the world. More generally, social media have given ordinary users some of the power once limited to mainstream media.

The insertion of news consumers into news production processes contributes to social movement actors' ability to usurp some of the mainstream media's power. Everyday citizens also have a say in what news gets circulated, and social media affords a space for digital audiences to engage in the distribution of protest and civil unrest coverage. Users play an important part in dissemination of protest news. It can be assumed that personal values and interests, as well as the political stances of social media users, could influence how they choose to share or engage with different types of protest news.

Through likes, shares, comments, and other forms of engagement, social media users have the power to disrupt the distribution of news stories that follow the negative, formulaic pattern of coverage that delegitimizes protesters and their causes. In several instances, social media users have amplified more positive coverage of protests than the protest paradigm would predict in some modern protests. Such was the case in protests in Ayotzinapa, Mexico, that followed weeks of demonstrations against government impunity after the disappearance of 43 students. Social media audiences amplified legitimizing coverage by sharing and engaging with stories across multiple platforms. In fact, Twitter users across the globe have been found to engage with protest news stories containing the legitimizing debate frame more than with stories using the delegitimizing frames characteristic of the protest paradigm. Ultimately, the spread of legitimizing coverage helps the public sympathize and support civil unrest and disruptive efforts to right injustices.

Users' ability to validate protest coverage via their "liking" and "sharing" behavior has potentially significant consequences for social movements, as social media interactions not only shine the spotlight on movements and their messages but also can potentially help sway public opinion to view a movement more positively. However, not every topic benefits from user engagement. News stories on social media about the Women's March, anti-Trump protests, and immigration protests received more positive coverage and more social media circulation than did stories about anti-racism protests such as Black Lives Matter. In other words, even as social media overall lessened the power of the paradigm, that did not hold true for all protests.

Unlike journalists, social media users are not bound by any professional norms of objectivity. As such, any user disruption of the paradigm must be critically questioned for its potential to also contribute to social media silos, thus limiting the ability of news about some protests—namely anti-racism ones—to gain visibility, broaden their reach, and attract support from new publics. It will, however, be important for researchers to revisit hierarchies of coverage on social media in light of the Black Lives Matter protests that swept the United States after police killed George Floyd in 2020, as this was a moment that could test the boundaries of the paradigm through traditional and social media venues.

In addition, social media users are not interacting with protest coverage in a vacuum. While overall, their engagement decisions might interfere with the protest paradigm, it's important to recognize that societal norms still are at play in which protest news stories are shared and liked more often. The focus, geographic region, and language of a media outlet, alongside the geographic region and topic of a protest, all make a significant difference in adherence to the paradigm and/or social media engagement. When journalists discuss protests and movements on social media, their coverage also tends to deviate more from the patterns produced by mainstream press coverage. However, even these patterns suggest journalists continue to marginalize protesters. Research has indicated that protest news on social media merely reproduces episodic coverage in traditional mainstream media.

Journalists and their media organizations continue to play fundamental roles in protest coverage, even on social media. Just because coverage is on social media, this does not mean it is inherently different than what is in traditional media. Further, as we consider social media to be an actor in social movement processes, we also cannot ignore the role of algorithms and other affordances of the platforms controlled by capitalist companies not originally designed with social progress in mind.

Social media enables movements to broadcast their messages, gain visibility, and signal strength to others. Social media activism campaigns can bring attention and even legitimacy to movements that otherwise might be misunderstood or ignored. Social media have changed the communicating capacity, and organizing strategies for movements, facilitating mobilization across time and space. Movement hashtags (e.g., #BringBackOurGirls, #MeToo, #NoBanNoWall, #BlackLivesMatter) are now popular organizing mechanisms that afford activists the opportunity to connect with others and form digital communities.

Some scholars criticize social media campaigns designed around the use of a certain hashtag or changing of profile pictures, for encouraging "slacktivism," or online, performative gestures unaccompanied by real-world actions or tangible effect. However, others contend that not only does digital activism allow citizens to create their own coverage, it also can help reshape media representations and public perceptions. Peer-to-peer communication tends to prompt higher levels of trust than blanket messages from news media. As such, social media have allowed protesters to take control of their messages, bypassing the traditional gatekeepers of mainstream news media that tend to negatively portray their causes. Twitter, in particular, has been found to be useful among marginalized groups for strengthening collective identities, creating solidarity, and countering negative representations in the press and popular culture, thus operating as a counter-hegemonic networked public. For all their positive contributions to identity and mobilization, social media might, in fact, undercut a protest movement, as algorithms privilege viral and spectacular content, users' participatory media-making can reinforce stereotypes, and accusations of terms of service violations routinely

result in activist accounts and content being taken down.

CLASSIFIED ADVERTISING

Since the mid-1990s, the term *classified advertising* has expanded from those relatively short messages merely appearing as print ads to more elaborate types of advertising in various periodicals, as well as on the Internet and cable television. As newspaper classifieds have notably declined, those on electronic media continue to expand.

Classified advertisements have proved to be a boon for consumers and newspapers for hundreds of years. They have proved to be a useful resource across demographic and other boundaries. Today, these ads of the people are “classified” into different categories, ranging from different jobs available, apartment rentals, and even matrimonial propositions.

Characteristically, the text of classified advertisements is set in uniform type size and style, usually without illustration. The three major headings are Employment, Real Estate, and Automotive, although there are many additional categories. Classified advertising is usually located in its own separate section of a publication and has its own rate card. It is responsible for a major portion of most publishers’ revenue. Rates are based on the amount of space (words or lines of copy) and the

length of time the ad will run. The longer the run, the cheaper the per diem rate will be.

Quite simply, print advertising is divided into two basic categories, classified and display advertising.

Development

The term *classified* emerged in the 19th-century newspapers because it generally grouped together small ads within the publication under headings classifying the product or service being offered. Thus, ads were grouped into distinct categories in one section of the newspaper, distinguished from the larger illustrated “display ads.” The latter, interspersed with editorial content, were generally placed by businesses or individuals engaged in at least some moderate-sized enterprises.

There were subtle changes in style over the years. While “want ads” became a category by 1835–1836, led by the *New York Morning Herald* in 1848, the practice of placing a small illustration cut in the top left corner of ads as a categorizing tool was discarded in favor of classifieds with the first line set in small capital letters. The only difference for the next century was that only the first or index word was capitalized, for example, “HOUSE for Sale.”

Gilbert Gundersen, in *The Story of Classified Ads*, notes that by the 1920s, one could see readers turn to the back pages of a newspaper, preferring to peruse the classified section before reading through the headlines of the day. For the man out of work, the most vital section of the paper was found in the “Help Wanted” classifieds.

During World War II, help-wanted advertising increased dramatically as men left jobs to enter the armed forces. This left a tremendous number of jobs that needed to be filled. During July 1943, for instance, the *Chicago Tribune* noted that such ads had swelled its classified section to the point where 51% of the newsprint consumed that month was devoted to classified ads. Because of the war, newsprint was at a premium; yet the Chicago newspaper wished to maintain its dominance as a classified medium. The solution combined switching to a nine-column format and using smaller type. This actually increased the average number of revenue lines per column by 20%.

The author of a leading advertising textbook in 1950, Otto Kleppner (*Advertising Procedure*), articulated the vital importance of classifieds in media culture of the day. Classifieds are closely read, he argued, for the person who looks at them is already interested in the product or service they advertise. Classified advertising remained of major importance to newspapers into the early 1960s, though it was only of occasional interest to national advertisers. More interest had developed in classified display ads: more white space, larger typefaces, illustrations, and, by the 1990s, color.

National outlets for classifieds appeared, starting in 1982 with *USA Today*, the first nationally produced general daily newspaper. In August 2008, the newspaper’s “Marketplace Today” contained such classified categories as Business Opportunities, Investment Property, and Health/Fitness. “Real Estate Marketplace” consisted most of classified display ads in such categories as Prefab Homes, Land, Time-Share, and Condos.

Other prominent newspapers included classifieds in their national editions. In one representative 2008 issue of *The New York Times*, for example, a typical one-half page section was devoted to “National Classified Advertising,” most of which were real estate ads, categorized according to state, city, or even county. Most referred to locations in the New York metropolitan region. In the same month, *The Wall Street Journal* included a page of mostly classified display ads fit under the heading of “Waterfront Properties,” with subheadings in various states.

Emerging Technologies

Well into the 1990s, most people turned to print ads when looking for a job, apartment rental, or real estate. Yet the Internet classified market had emerged to change that situation by 2000, and more newspapers were beginning to appear on the World Wide Web, either charging readers for the extra service or including it as a bonus to advertisers. Print classifieds offered very limited information, while the web could provide enhanced descriptions as well as digital media, including video and audio, as well as the “search and find” feature.

The initial competition for classified advertising had come from online services that introduced

two concepts to the world of classifieds: aggregation and vertical sites. New web competitors offered vertical services—a single category of classified advertising such as jobs—with the benefit of compiling classified advertising from numerous markets. Prospective job seekers, particularly those looking to relocate from other areas, now could look at a single site and see employment opportunities anywhere in the country (or internationally) without seeking out-of-town newspapers.

There is a notable blurring between print and broadcast media, as increasingly local newspapers are turning to broadcast quality video reports on their web locations. It may be getting to the point where there may be no such thing as a print media outlet, broadcast media outlet, or a web media outlet. All will become multimedia outlets.

Sam Diaz, staff writer for *The Washington Post*, wrote in the August 31, 2007, issue that before the advent of the Internet, a classified ad for Andrew Davis's 2001 Mitsubishi Montero SUV might have been limited to two lines of descriptive shorthand: A/C, pwr pkg, 6cyl AT, 2wd, \$9k firm. Today, in ads on the Internet, Davis can post pictures of his car in an off-road setting and sharing such details as when the timing belt and water pump were last replaced. He can include a link to a feature article about his car's model in *Popular Mechanics*. All this was posted free in classified ads on Craigslist and other networking sites. He also paid for an ad in *The Washington Post*, a bundled deal that also put his listing on Cars.com and other websites. His approach of putting his vehicle in front of as many potential buyers as possible illustrates how dynamic the process of classified advertising has become.

Changing Revenue Streams

Once a steady source of revenue, classified advertising dropped between 14 and 20% between 2007 and 2008 at some larger newspaper chains. This drop was notable in once-lucrative segments such as automotive, real estate, and employment ads. This drop eclipsed that experienced even during the Great Depression of the 1930s, and this is largely due to fundamental newspaper challenges. Circulation is declining as readers move online and advertisers chase them, looking for more

targeted and measurable ad outlets. There are also cyclical issues: the economic and real estate downturn in 2007 to 2008 hurt advertising badly, particularly the national, retail, and classified ads that newspapers depend on. As one example, a yield of \$12.1 million for classified advertising at the venerable *Milwaukee Journal Sentinel* (both print and online) represented a decrease of about 22% for the first quarter of 2008. This was the 11th consecutive quarterly decrease in the paper's classified advertising.

Internet advertising presents a contrasting picture. By mid-2007, online traffic to classified ad sites had grown 23%, to more than 46 million unique visitors, up from about 37 million a year earlier. Walmart, the world's largest retailer, launched a classified advertising website, a move to open a broader range of shopping to its Internet customers.

Yet not all the print news is bad. Newspapers serving smaller suburban communities are faring much better than their counterparts in large metropolitan areas. Total ad revenues for community papers experienced a relatively modest decline of 2.4% in 2008 from the previous year. Community papers provide hyperlocal news and advertising that no other medium can effectively provide. Their unique local product contrasts with national and international news delivered by bigger papers. Yet the very definition of the local audience is expected to change constantly. Many are as apt to check out ads in *USA Today* (in print and online) or other websites when looking to change jobs, as they are to turn to local publications.

The classified market has become increasingly fragmented as a growing number of companies search for ways to convert offline newspaper ads into a web format. Two primary online approaches are emerging. One is simply to shift traditional classifieds to the web, aggregating ads to a single site. The other involves distributing those aggregated ads over as many websites as possible.

Many in the newspaper industry blame Craigslist, the seventh most popular website in the United States, for the downturn of their classified advertising business. A no-frills, ad-free, user-sensitive site, Craigslist has generated more than 600 million free classified listings. But companies are trying to do things online that lead to offline transactions, and because ultimately transactions

resulting from classified advertising will involve offline interaction, local papers say they will remain key players, even as classifieds find more venues online.

The Yellow Pages

The very first time the term *yellow pages* was used was in 1881. It is alleged that a printer working on a regular telephone directory ran out of white paper and used yellow paper instead. Then in 1886, Reuben H. Donnelley produced the first Yellow Pages directory in Chicago, featuring business names and phone numbers, categorized by the types of products and services provided.

While the term *classified advertising* may not bring the Yellow Pages to mind, they are one of the primary examples of this ad form. The Yellow Pages' history goes back to 1864, when Richard Robert Donnelley established a small printing plant in Chicago. In 1874, his company, R.R. Donnelley and Sons, developed and printed the *Chicago City Directory*, the first listing of companies and their addresses, which has evolved into what today is known as the telephone directory. In early 1886, the Chicago Directory Company began publishing a phone directory three times a year for the Chicago Telephone Company. That event is generally acknowledged as the birth of the classified telephone directory advertising industry—the Yellow Pages. The Yellow Pages continue to be an incredibly efficient advertising medium.

With the explosion of classified advertising on the Internet, the Yellow Pages have suffered the same problems as newspapers. And, like many newspapers, directory publishers are competing by setting up their own online sites. In the future of classified ads, newspaper publishers understand that their classified advertising businesses will be fundamentally different in the future. Joint efforts go beyond a newspaper posting local help-wanted ads on its own website. CareerBuilder, for example, is a jointly administered site on which Knight Ridder and Tribune Company combine their recruitment ads; the site has national reach and enough traffic to compete with the two leading job-posting sites, Monster.com and HotJobs.com. The CareerBuilder site, in turn, can give employers access to individual markets through participating newspapers' print want ads.

In recent years, as customers migrated to the web, the telephone directory business followed, hoping that the Internet would save it. The strategy has not panned out. The audience for online Yellow Pages remains relatively small, and the glut of online directory services competing for the advertiser dollars of local businesses means that there is no authoritative site for advertisers. Between 2005 and 2008, Yellow Pages publishers made concerted efforts to reinvent themselves, launching numerous digital offerings for advertisers. The 2008 economic downturn compounded the situation. In 2009, print and online ad spending on Yellow Pages is expected to plummet 6.3%, more than double the rate of decline projected for broadcast television, noted by John Janedis, a Wachovia analyst. It is anticipated that from 2008 to 2012, ad spending will fall 39% in print directories alone. This is the steepest projected decline across all local media categories, according to media research firm Borrell Associates. Finally, the publishers have been facing considerable debt, posing the real prospects of extinction.

It is crucial for local newspapers to protect their recruitment-ad turf against the national—in fact, borderless—online sites. Classified advertising has generated up to 40% of a daily newspaper's revenue, and job recruitment advertising accounts for 44% of total classifieds, or about 18% of total ad revenue. Newspapers are fighting back by bundling their want ads into websites with a national reach, which puts them in a better position to compete against the giants of online media.

Even the Newspaper Association of America is linking member newspapers via a site called *Bona Fide Classified*, which provides access to those papers' online classifieds. It allows users the opportunity to search over 1,100 individual newspapers' classified sections. The *Daily News* in Bowling Green, Kentucky, is one of the first newspapers to chart the "mash-up" concept with classified ads. With a daily circulation of 21,000-plus, the newspaper is combining data from Google Maps and yard sale ads from its classified section. The result is an online map that pinpoints the exact location of the sales.

While their form changes, classified ads are alive and well and will continue to attract readers. Although still dominated by the daily newspaper, they are extending their reach and function into

other media, especially the web. Classified advertising is transitioning from its primary print format and embracing the opportunities offered by the Internet not only to expand the methods of ad presentation—through multimedia tools, user interactivity, hyperlinks, multiple images, and searchability—but also to adapt to the possibilities of a worldwide marketplace.

CLICKBAIT

Clickbait is a late 20th-century term that broadly refers to two converging practices in headline construction. One is rooted in news routines: the urge to present a development in clearer, more compelling terms than it would appear with the qualifications and hedges of a full text. The second, rooted in marketing, reflects the interaction of news and technology: the withholding of information (on promise of its imminent appearance) to draw the audience farther into a page or website. These practices have been brought together by the structural transition in commercial journalism from a

mass market model to a more itemized structure in which the individual article itself can become the measured unit of value, and “native” advertising, often harder to distinguish from news than traditional print advertising, becomes the preferred choice of advertisers. The increasing use of social media platforms to access and share news underscores the significance of click baiting to professional concerns about instant gratification at the expense of public interest. The bait might be used not just to move the reader around within a platform but to move the reader from one platform to another, in which standard credibility cues of familiarity or timeliness might be supplanted by personalized cues or simply done away with altogether. This entry traces the development of the practices described above with an eye on their role as a converged economic function. The entry considers how and under what circumstances click baiting affects audiences and where it might stand on the often transitory list of abstractive processes such as headlines as they have evolved over time and among news cultures. Clickbait is also discussed as an ideological practice and as a form, or carrier, of fake news.

Clickbait Defined

Clickbait, at its simplest, is a trail that is meant to be followed. Many definitions also suggest that the bait promises higher quality than the content delivers or takes the reader to appealing content unrelated to the context in which the link appears: the topic-adjacent stories about movies or food that might appear on a news website when a winter storm is expected. As a marketing/advertising tactic, clickbait capitalizes on the narrative gap created between an enticing headline and an unknown text. Information is rationed out to bring the audience along, often following techniques familiar in U.S. news practice from the mid-20th century: the use of nonspecified pronouns (He thought A, but B), posing questions that are answered in the text (Does A support B?), or ending a headline after a subordinate clause (But when they . . .). Thus, some scholarly definitions restrict click baiting to cases in which a headline or link depends semantically on information from the main text to be understood. Other approaches associate clickbait with the related

practice of aggregation or to an emphasis on “soft news” or feature topics, though click baiting is frequent in hard news as well.

Many features of clickbait are familiar because the challenge of abstraction—the need to reduce an event in size while fitting it into a narrative structure—has long been familiar to journalism. The 2-hour meeting or sporting contest produces a sequential flow of events that must be organized, reduced, and shaped into a coherent whole, then summarized in even fewer words as a headline. Qualifications and hedges, essential in the course of the event itself, are discarded as the sequence becomes a narrative. This corner-cutting might yield a story that is tauter than an earlier text—panicked shots fired by a frightened woman at her attacker become “neatly aimed bullets” by the trial—or a headline that is brighter than the story, without presumptively counting as fakery; absent the ability to prove a negative or see the future, the event might indeed have been as exciting as promised. One form of this practice is known as hedge deletion: assertions become more authoritative by shedding qualifiers such as “expected to” or “as many as,” and this loss is more common as they move farther from the event in time and distance. Rearranging evidence for storytelling purposes is also not novel; it can be dated to the early days of news photography in the 19th century and continued into the new century with innovations such as the *composograph*, which combined actual images into real or fanciful scenes (recently deceased celebrities being greeted in heaven, for example).

Such narrative techniques became associated with the marketing model that enabled mass-circulation newspapers. As distinct from online or broadcast models, paid content has been consumed (for the advertiser’s purpose) with a subscription to the paper or the sale of a single copy. Information is not withheld because of an economic need to draw the reader farther in; those enticements are there to complete the sale in the first place. Some professional concerns about the impact of clickbait, then, reflect longstanding questions about how either the selection of events (gatekeeping) or the nature of the events (framing) is prone to being drawn away from a public service ideal toward sensationalism or prurience.

Clickbait is also enabled by the further abstraction inherent in the headline: the event that became a 500-word narrative now becomes an eight-word summary, underscoring clickbait’s connection to the more established traditions of tabloidization. Tabloid headlines are meant to be sharper and livelier, more prone to invitation and less to hedging, than those of the “quality” press. The traditional headline mission described in journalism textbooks is to attract the reader through inclusion: an emphasis on key words or topics that might underscore a personal connection. Because the metered model of funding is rewarded when the reader lingers on a page or advances to another one, clickbait can attract readers through exclusion: information withheld until the reader advances, the second of the practices described earlier.

Information withholding has usually been more evident in commercially supported broadcast journalism because support is structured differently; where the newspaper buyer paid for the advertising up front, the listener/viewer must linger into the next segment before the ads there can work their magic. Hence the clichés of local television news: “Will it rain on your parade? Back with the weather after this.” The convergence of news media has brought such habits closer together; while journalistic output has always been subject to assessment by more or less crude metrics, the ability to monitor individual stories, and the paths by which audiences arrive at and leave them, has aligned written journalism more closely with the era of the set-top box that recorded TV viewing habits. The collapse of mass-market funding models and the rise of native advertising, which blurs the once rigidly enforced visual distinctions between news content and paid content, has heightened concerns about convergence and focused attention on what clickbait does.

Media Effects

Clickbait is also a style independent of metering considerations, as shown by the appearance of its lexical (“you won’t believe . . .”) and syntactic (associations of verb tense with timeliness) signals in media such as print, where clicks provide no benefit. Similar stylistic features have come and gone in media practice before; the “verb-first”

headline (an active clause with elided subject: “Nab 3 In Heist”), once prominent in U.S. journalism, has largely disappeared. Because click baiting occurs across many sectors of U.S. media, from partisan aggregators to public radio, and because of its association with radical changes to the economic model of journalism, click baiting raises questions about cognitive and affective outcomes: to simplify several theories at once, both what media do to people and what people do to media.

Journalists and audiences, in effect, train each other on new habits of consumption; the informational graphic quickly became fashionable after the debut of *USA Today* in the 1980s, but early “videotex” services fell by the way. The permanence or persistence of clickbait-era media effects, then, should be considered as tentative as similar findings were during the evolution of media theories in the 20th century. What an established audience finds unprofessional and careless might seem like best practice to an audience native to the digital milieu. How such an outcome interacts with other aspects of consumption or practice to address perceptions of credibility or quality, or how information is interpreted, synthesized, and retained, has been a matter of growing interest, but such patterns should not be expected to be permanent.

Given its roots in the sensationalism and extreme abbreviation associated with tabloids, click baiting has been examined for its impact on emotional arousal. Clickbait headlines have been found to resemble tabloid headlines in stimulating emotional arousal, with that arousal also associated with intent to click and read. Click baiting has also been associated with more consistent recognition of a news article’s “main point” in some presentation conditions, perhaps reflecting emotional arousal or the extra work involved in closing the headline-text gap, but does not appear to have an independent effect on memory for details of a news presentation.

Effects of click baiting on attitudes toward news and its producers interact with such factors as age, acculturation, and levels of editing quality; the relationship between click baiting and credibility seems to be related to whether audiences are socialized to accept traditional headlines as the norm. Click baiting has also been associated with lower perceptions of quality under some circumstances and with sometimes counterintuitive effects

on perceptions of value in others. While click baiting might be distasteful to parts of the audience, research to date does not clearly set its impact apart from other innovations in news practice.

Clickbait as an Ideological Practice

Like many other news practices, clickbait is also a site of ideological practice, at least as a potential carrier of ideology. This does not mean clickbait is by definition a form of fake news, but because it is indifferent to the traditional tight factual connection of headline to text—clickbait’s job is done when the reader clicks through to the text, whether the headline accurately represents the text or not—it is a potential carrier for disinformation and misinformation.

Several attributes of clickbait could contribute to lowering the barriers that audiences might normally have in place against faulty information. Accessed from social media, an article might lack familiar indications of its origin; traditionally vetted news might be indistinguishable from the product of partisan aggregators, and parody might be indistinguishable from news. Similarly, changes in how headline stylings address past events can ease the passage of older news—Twitter messages from 3 months earlier, or a ruling from a previous election cycle—into the stream of current events. The visual grammar of an established news organization’s presentation had traditionally kept such barriers higher, but the indistinguishability of linked headlines from each other and the closer resemblance of native advertising to the news product have posed questions that are yet to be fully explored.

The practice of withholding information that is promised on the click-through can also enable an innocuous procedural article—a study supporting earlier findings about combating a pandemic, for example—to promise on the homepage an outcome more ideologically in tune for a partisan audience: “New study debunks this belief” makes clear that something is debunked but is vague about which beliefs are confirmed or rejected. Again, though, while such concerns might be heightened by the growing prominence of partisan news sites, conclusions that click baiting is more harmful than other trends in news practice remain tentative.

As with other stylistic features, clickbait's permanence is difficult to forecast, but its interactions with established media effects and theories amid the economic upheaval of the 21st century underscore its relevance as a topic for study.

CLIPPING SERVICES

Press clipping services monitor media for content of interest to their clients. They scan through newspapers, magazines, and electronic media, select

pertinent items, and then package ("clip") them for easy perusal. The industry's name derives from the traditional practice of clipping items with a pair of scissors from the newspaper for safekeeping. Modern-day services track not only newspapers but also nearly every print, broadcast, cable, and web-based information outlet, running the spectrum from network news broadcasts to teenagers' blogs.

Development

Clipping services have their origins in the expanding media environments of late-nineteenth-century cities. As the number of newspaper titles grew, editions multiplied, and issues expanded in length, a handful of entrepreneurs independently hit on the idea of a press monitoring service. Henry Romeike started the earliest clipping (or cutting) service in London in 1881 and quickly expanded its operations to New York, Paris, and Berlin. Romeike relocated to the United States in 1886 to take charge of his New York office, servicing a roster of entertainers, politicians, industrialists, and socialites eager to keep track of their press coverage. Frank Burrelle, an attorney who had represented mining companies and other clients grappling with image problems, started a similar operation with wife, Nellie, after detecting a demand for such a service among businessmen. Robert Luce, a Boston reporter and later U.S. congressman, started his service at roughly the same time. Burrelle's, Romeike, Luce, and National Press Intelligence took the national lead during the first decades of the twentieth century, while dozens of smaller companies carved out local markets.

Clipping services used industrialized reading operations to provide clients with a steady stream of articles snipped from newspapers and magazines across the country. The thousands of daily, weekly, and monthly periodicals the services subscribed to were reviewed by large staffs of mostly female readers. Each reader, guided by thousands of keywords committed to memory, scanned papers page by page, marking articles of interest. Marked papers were then turned over to razor-wielding clippers, usually men, who sliced out the items and glued them onto color-coded slips. A third group of workers sorted, packaged, and mailed off the clipped stories to clients. Services were paid a fixed retainer fee and collected a few cents per clipping.

Expansion

The clipping services have since the 1960s steadily expanded their operations beyond print media monitoring. Burrelle's began offering local media directories, inventorying all of the newspapers, magazines, and broadcast outlets in a state or region in 1960. In the 1970s, the company started monitoring radio and television transcripts. Shortly after, VCR technology made it feasible for services to record, edit, and package broadcast news clips.

Throughout its history, the industry has often been derided as a service for self-absorbed celebrities. Admonitions against "reading your own press clippings" even entered the vernacular as a warning to those in danger of becoming too entranced by their public persona. But this image of a frivolous, vanity service has always been a mischaracterization that overlooks the important social, political, and economic work carried out by the industry. From their start, clipping services sold themselves to politicians, businesses, and other powerful interests as a form of surveillance. Romeike's client list counted leading merchants, manufacturers, and political leaders along with actors and entertainers. Burrelle boasted in a 1905 interview of being able to provide the name of every new amputee in the United States to a client who manufactured artificial limbs. Throughout most of the twentieth century, developers and engineering firms relied on clippings to monitor public budgets, new zoning ordinances, and myriad other concerns to guide their marketing plans. Advertisers used the service to keep an eye on competitor's campaigns. Public relations offices relied heavily on clippings to detect threats to their clients' images and gauge their own success in garnering coverage. The U.S. Department of Defense created its own clipping service to publish a daily journal of cuttings, *The Early Bird*, which became a reading staple among inside-the-beltway power players. In this sense, the press clipping can best be understood as a control technology developed for transforming raw information into social power.

The clipping services' fortunes have been tied since the 1970s to three interrelated developments—heightened corporate sensitivity to image issues, a higher premium placed on market data, and advances in information technology. While

public relations had for decades been central to business strategy, many industries responded to what they deemed an antibusiness climate in the early 1970s, marked by mobilization among environmental, consumer-rights, and corporate-watchdog groups, by dramatically strengthening their image-control efforts. Media monitoring thus became a more crucial activity as businesses built public relations campaigns to deflect the criticisms mounting before them. At the same time, new communication technologies—satellites, data-transmission links, and computer networks—both accelerated the speed of business transactions and drew regional markets across the globe into closer relations. Media surveillance took on added value in this environment as businesses were faced with the problem of sorting through haystacks of information in search of the needles that could give them a competitive edge.

Technology and the Clipping Industry

Automation and new information technologies enabled the clipping industry to meet and, in turn, stoke this heightened demand. Through the 1960s, press clippers had operated in much the same manner they had six decades prior. But beginning in the 1970s, companies turned to computers to streamline their processes and offer new services. Monitors hooked up to mainframes replaced bulky keyword volumes. Workers coded stories onto computer punch cards to offer efficient storage, faster retrieval options, and powerful new forms of data analysis. New business machines allowed clippers to cut their delivery times as well. Burrelle's, for example, trimmed weeks off the industry standard by offering overnight turnaround via fax machine by the mid-1980s. By the early 1990s, services were developing search programs to crawl databases and World Wide Web pages for items of interest.

The press clipping industry has undergone dramatic changes since the early 1990s. The leading firms in the industry merged to form BurrellesLuce in 2003. At the same time, many new companies sprang up to capitalize on sophisticated search technologies and the explosion of web content. Automated searches offer clients access to rumors and breaking news by continuously crawling through webpages, online transcripts, blogs, chat

rooms, social-networking sites, and video clips. Along with expanding their reach, web technologies have dramatically changed the way clipping services package and deliver their findings. Rather than mailing or faxing clips, companies offer online portals through which clients can retrieve, organize, and analyze them. And web applications offer near real-time alert services. Critical Mention, a company with a niche specialty in television news, boasts the ability to alert clients within a minute from the time a clip aired. In terms of print media, the services have supplanted many of their readers and clippers with electronic scanners as both a laborsaving device and means of building larger, more searchable archives. Burrelles, for instance, still produces paper slips, but these are now printed versions of scans rather than physical cuttings from publications. In addition to the publication and date included on the slips of old, the scans include information ranging from copyright notices to thumbnail-sized images of the source page.

The innovations that have allowed clipping services to exponentially expand their reach and cut their delivery time have had a paradoxical impact on the industry. The same technologies have largely democratized, in the form of popular search engines, the industry's basic service—surveillance of a media universe too big for any one person to keep track of. Influenced by the fortunes the magazine and cable television industries found in audience fragmentation, media research labs experimented with ways of creating electronic newspapers that were narrowly tailored to reflect the interests of individual readers. Knight-Ridder fittingly called its early 1990s prototype—a mobile, tablet-sized computer—the *Daily Me*. While the *Daily Me* never made it to the mass market, Yahoo and Google popularized the basic concept through their news crawling capabilities. Both portals offer individualized news pages gleaned from thousands of international media outlets according to the interests indicated in the user's profile. A hypothetical reader in Seattle interested in Pennsylvania politics, deforestation in the Amazon, and the British soccer club Arsenal can open her web browser every morning to a page made up entirely of clippings on those topics. RSS feeds piped in through Google's ready-made templates can feed readers the news that most interests them as it is posted.

As the lines between clipping services and popular technologies have blurred, the former have looked to value-added services as a means of distinguishing themselves. In 2010, BurrellesLuce introduced a media outreach, monitoring, and analytics service portal, and in 2012, it acquired the U.S. print monitoring operations of Cision, becoming the only media monitoring service to provide print coverage. In 2019, BurrellesLuce rebranded as Burrelles and launched a significantly expanded portfolio of products and services.

Others look to social science as a means of setting themselves apart. Dow Jones, for example, promotes its subtle understanding of how new ideas diffuse through media networks. And just as its antecedents offered to read through the mountains of metropolitan dailies a century ago, Burrelles now offers “editors” that comb through the thousands of hits returned by search engines. The clipping services thus continue to rely on the strategy that has been at their core since the industry's inception—the willingness to read the news in its entirety, no matter how tedious a chore that may be.

CNN

CNN was a big gamble when Ted Turner started the first *superstation*. The network was—and as of 2021 still is—headquartered in Atlanta, Georgia. What made it *super* was the acquisition of satellite time that had been allocated to ABC. This allowed his Cable News Network to be seen anywhere in the world. CNN proved itself over a few high-profile stories that were reported in depth and in both live and recorded formats. CNN was the first network or channel to switch from terrestrial to satellite dissemination and to a 24-hour news cycle. With the advent of the global Internet, almost any station can now stream its programs over the Internet but that was not the case in the 1970s when CNN grew from a small television station to being the progenitor of all the contemporary 24-hour news cycles for each of the networks and all of the local and regional providers. This entry examines the prelaunch and launch of CNN, its early programming, and the development of the network over time. The entry also discusses the network within the context of bias and fake news.

Prelaunch

CNN, or the Cable News Network, started in 1970 when Turner bought a small Atlanta television station. Over the next 10 years, Turner amassed both enough capital and knowledge to turn his Atlanta station into WTBS, the Turner Broadcasting System. In 1976, Turner bought the Atlanta Braves and kept ownership for 10 years. Turner was not a complete unknown during the decade leading to the launch of CNN, but many thought of him as the *scrappy* outsider whose yacht *Courageous* won the Americas Cup yacht race in 1977, beating the Australian entry to the race. Turner was not without his critics, however. The owner of FOX News, Australian media mogul Rupert Murdoch had a lengthy dispute with Turner and CNN. The feud with Murdoch started in 1983 over a disputed incident of one boat interfering with another during a race.

The Americas Cup win and the purchase of the Braves were indicative of Turner's ambitions. Turner pioneered the creation of the *superstation* model, finding a home on many cable television

menus and shifting from terrestrial to satellite delivery of program content. Turner—and TBS—finally bought the Satellite News Channel from ABC in 1983. This gave Turner more control of programming and removed his chief competition—ABC News—at the same time. Turner dropped \$20M into the creation of CNN, along with 25 other original members who each dropped \$20M. A good part of this capital went into the creation of a state-of-the-art news center in Atlanta, and by 1980, CNN was set to rewrite the way broadcast news was done.

Launch

At 5:00 p.m. on Sunday, June 1, 1980, the first 24-hour news service went on the cable. Up to this point, there had been a local *news cycle* that showcased morning and evening newscasts plus a late evening broadcast. The news cycles were important to broadcast journalists. A regular cycle of local, national, and international stories allowed reporters, editors, and news directors to perform their due diligence, checking sources, to present late-breaking stories, and simply to take a breath before a story hit the air. The possibility of filling out a story was all but lost. With 24-hour news and informational programming, all news was breaking news. There was little or no time to take a beat to consider the impact of how a story was visually and textually presented. As news management became aware of news and information as profit centers, more money was spent on more elaborate sets and lighting as well as better studio cameras and more high-profile journalists. More minutes of ads consumed a standard half-hour newscast. With a 24-hour cycle of news and interview shows, the number of commercial minutes available also grew. Not surprisingly, other news outlets followed CNN to their own 24-hour program of news. But CNN was the first to attempt this, and the look and feel of broadcast news had changed.

Early Programming

A few early programs on CNN established the network as a leading source of interviews as well as breaking news content. With Larry King's *Crossfire* and Lou Dobbs' *Moneysline*, the network gained some journalistic credibility. The early

years of programming spoke to the unique nature of programming for a 24/7 news and information source. Some of the early programs included:

- *Both Sides with Jesse Jackson* (1992–2000),
- *CNN Daybreak* (1980–2005),
- *CNN Live Today* (2001–2006),
- *Connie Chung Tonight* (2002–2003),
- *Crossfire* (1982–2005 and 2013–2014),
- *Freeman Reports* (1980–1985),
- *Larry King Live* (1985–2010),
- *Late Edition with Wolf Blitzer* (1993–2009),
- *Lou Dobbs Tonight* (1980–2009),
- *Paula Zahn Now* (2003–2007),
- *Sports Tonight* (1980–2001),
- *Style with Elsa Klensch* (1980–2000), and
- *Wolf Blitzer Reports* (2001–2005).

There was widespread hope at CNN that the 2012 election would bring people back to CNN. The reelection campaign for President Obama promised to be hard-fought and would likely draw younger voters to the polls and to the various networks they would watch for continuing news coverage of the campaigns and the election. While ratings did go up, the looked-for younger voters did not materialize as had been hoped.

CNN Grows Up

The first newscast on the newly christened network was anchored by husband and wife anchor team Dave Walker and Lois Hart and featured an interview with President Jimmy Carter by Daniel Schorr. Other networks were watching closely. The early iteration of CNN drew critique from the more established channels and networks, which at times called CNN the *Chicken Noodle Network*. CNN in its early phase had a viewing area that covered about 2 million people, and for a few years, it was steadily increasing its number of viewers. As of 2021, CNN is seen by more than 150 million people around the globe. Two important stories helped CNN get some serious street credibility: they were the first on the scene in the 1986 Challenger disaster, and for their live coverage of the 1991 Gulf War which found Bernard Shaw, John Holliman, and Peter Arnett covering the story from the balcony of their Baghdad hotel

room. Arnett was the last reporter to leave Baghdad as the Gulf War heated up and demonstrated that CNN was establishing some important credibility as a source for journalism without political leanings. With a slogan of *fair and balanced*, CNN was shaping its role as an unbiased source of news and information. But it was never enough on its own to overtake either FOX News or MSNBC.

Contemporary Programming

Other contemporary shows and news anchors include John King (*Inside Politics*), Fredricka Whitfield (*CNN Newsroom—Atlanta*), Ana Cabrera (*CNN Newsroom—New York*), Fareed Zakaria (*Fareed Zakaria GPS*), and *The Lead with Jake Tapper*.

CNN has managed to keep producing news, as well as non-news programming, about many current topics of wide interest. Some of those have included:

- *Anderson Cooper 360*,
- *Anthony Bourdain: Parts Unknown* (2013),
- *Chasing Life with Dr. Sanjay Gupta* (2019),
- *The Hunt with John Walsh* (2014),
- *The Kennedys* (2018),
- *CNN Heroes* (2007),
- *Pope: The Most Powerful Man in History* (2018),
- *Prime Time with Chris Cuomo*,
- *The Movies* (2019),
- *This is Life with Lisa Ling* (2014), and
- *United Shades of America* (2016).

CNN has also produced original series such as *The five decades that shaped America* (*The 2000s*, *The Nineties*, *The Eighties*, *The Seventies*, *The Sixties*), *1968: The Year that Changed America* (2018), *The History of Comedy* (2017), and the *Race for the White House* (2016).

During the middle years of programming, CNN and FOX News were both having some lean years. The former head of NBC, Jeff Zucker, was hired to run CNN Worldwide. FOX News and MSNBC continued to attract more and more viewers until CNN became stabilized in third place by the end of the decade. Ten quarters in a row of falling viewer ratings solidified CNN in third place behind both FOX News and MSNBC. In large part, this was due to the work of Roger Ailes, the

former FOX News chief, who tapped into the mood of the country and designed FOX News to meet that mood. The 2016 election results forced CNN to reexamine its large-scale coverage of President Trump's campaign, effectively squeezing out other candidates' voices, becoming a real discussion of the CNN Effect: What happens when constant news coverage of a single significant event can have an impact on policy and political decision-making.

The CNN Effect

Largely regarded to be a generic term, the CNN Effect is one way to look at and understand the exploding news climate of the 1970s, 1980s, and 1990s. A 24-hour live news capability let CNN cover stories as early as the Vietnam war, but the impact of unending storytelling became apparent during Operation Desert Storm in the early 1990s. Images of starvation and war compelled the United States to withdraw from Somalia after images of dead American Rangers being dragged through the streets of Mogadishu were shown repeatedly on CNN and elsewhere. The CNN Effect, then, applies to any time media coverage of an event leads to foreign policy decisions. While not confined to just one network or other media outlet, it was the impact of breaking news, presented both live and repeatedly throughout the day and night by CNN that led to the naming of this effect. The term *CNN Effect* may have become generic over the years; it is now assumed that the presentation of graphic images do have a cumulative impact on policy, but not enough by themselves to change foreign or domestic politics or decision-making.

Bias

The powers that program and manage the three major 24-hour cable news channels talk about how unbiased they are in their pursuit of good stories, stories that might be managed to meet varying philosophical guidelines. The first to do this was the first of three to appear on the world stage: CNN. Claims of biased content have not stood up to scrutiny. The strong suit for any of the cable news networks is their ability to go *live* when situations call for it. CNN was the first to

utilize this ability, and over the years, CNN has been seen as less biased than MSNBC on the left and FOX on the right. But research has shown that viewers want journalism that takes a stand on issues, consistently ranking FOX as most watched, followed by MSNBC, and the lowest ranking usually given to CNN. The national network news is seen to be more illustrative than the cable network newscasts. FOX was seen as a right-wing palliative to the news being presented on CNN. In later years, though, FOX became the channel to beat, overtaking both CNN and MSNBC for network cable news dominance. Late in the 1990s, CNN and MSNBC hoped to gain viewers, but neither of them came close to the ratings of FOX News.

Fake News

The polarization of news consumers, urged on by an administration that has found voice by calling news on CNN (and elsewhere) as being *fake*, can be seen in many public meetings and press conferences. This is not to say that the term is new; it is not. It has been around in some form for many years. *Fake news* has a different connotation than *misleading news* or *false news*. Just using the term *fake* carries meaning. But it is CNN that garners the most vitriol during press briefings and question-and-answer sessions with the administration. The term panders to the already conservative right and most heavily in the nation's midsection. The words used have a down-home clarity that is easy to understand, coupled with deeply held beliefs. This is known as *confirmation bias*, in which information is sought that confirms one's own already held positions or beliefs and downplays or even ignores any information that runs counter to those beliefs. Every time a president or other leader says those words, especially coupled with a dismissive tone, the bias becomes stronger. While MSNBC and the FOX Network seem more comfortable in their own liberal or conservative *skins*, respectively, CNN tries to strike a more objective stance.

CNN at 40

Looking back from 40 years of CNN, contributions have been made by people with a vision and the wherewithal to make those visions come true: Ted Turner at CNN, Jeff Zucker at MSNBC (and

later at CNN), Roger Ailes and Rupert Murdoch at FOX.

Ted Turner is no longer the driving force who created and sustained the channel through 40 years of programming, high ratings and low, personality-driven and data-driven. That mantle passed a while ago to Jeff Zucker who still has control at the channel and all of its many iterations. It was Zucker who recognized that programming should be entertaining as well as informative.

Zucker's life has revolved around his two careers: 25 years at NBC Universal and the 6 years he has spent running CNN Worldwide. The most notable feature of his career at CNN is the development of digital outlets. Zucker manages to keep his hands in the game, overseeing CNN International, HLN, Turner Sports, and the CNN television network, and this list does not even include Zucker's 25-year career at NBC.

Beyond 40

As CNN begins its next 40 years, it remains to be seen whether the network can survive in the scramble for more viewers, while remaining true to its past history. Whether it is Ted Turner or Jeff Zucker at CNN (after a quarter century at the helm of MSNBC), the future of 24-hour news channels is facing 24-hour news from a number of sources that may fragment an already fragmented market. Two technological advances may have impacts on news production: the proliferation of social media platforms and subscription television that promises to (and has already started to) develop paywalls for consumers who have cut the cable yet still want access to premium news and information programming. This is the environment that all cable providers may have to navigate.

Even though CNN is criticized for privileging entertainment news over breaking hard news, CNN and all its iterations around the globe reflect the mission of the network to provide objective coverage of the world. CNN was sold to WarnerMedia and its parent company, AT&T, and the sale was upheld by the federal courts in 2018.

COLLABORATIVE JOURNALISM

For journalism in general, but for local news and information providers in particular, the decade from 2010 to 2020 was one of resource scarcity, uncertainty, and rapid technological development. In democracies around the world, consolidation and cost cutting resulted in dramatic losses for journalism outlets in all but the largest cities. Within this context, many surviving outlets have turned to collaborative journalism as a way to share data and stretch limited resources while also providing what are often more comprehensive stories to bigger audiences. And, as many have realized, the digital age has created technological affordances that make collaboration easier than ever before. This entry defines collaborative journalism and discusses its history and reasons for its growth. It then looks at the different models of collaborative journalism, the promise of the approach, and some of the challenges it poses for news organizations.

Defining Collaborative Journalism

Collaborative journalism is a cooperative arrangement (formal or informal) between two or more news and information organizations, which aims to supplement each organization's resources and maximize the impact of the content produced. Collaborative journalism is not to be confused with "citizen-," "participatory-," "engaged-," "public-," or other types of journalism that solicit information from the public or consider interaction with the public a cornerstone practice (though an engagement element may be part of a collaborative project). While collaborative journalism is

most commonly thought of as being situated in newsrooms and news and information organizations that belong to the journalism field or the field of professional media more broadly, some collaborations involve other information-producing organizations such as civic groups, libraries, arts and culture organizations, and city halls.

History

In some sense, all journalism is collaborative; there is usually at least a reporter and an editor, and perhaps a photographer, videographer, or visual data person. Moreover, collaboration among reporters or between newsrooms has been practiced in different forms for more than 100 years. One of the earliest journalism collaborations was among the U.S. newsrooms that made up *the wires* in the mid-19th century; in 1846, six New York daily newspapers joined to form the Associated Press. Historians report that those outlets cooperated in gathering news and splitting the expenses of doing so.

In the 20th century, especially after the advent of the penny papers, competition between outlets was the norm. Yet, even during the height of profitability in the late 20th century, when competition, not collaboration, was the most salient relationship between newsrooms, it was common practice for journalists on the same beat to collaborate by sharing notes, swapping tips, and in general helping each other out. Formal collaboration during that period was most common within an organization rather than between. For example, Cable News Network (CNN) was formed in 1980 and codified intranewsroom sharing—between the national headquarters and its television news affiliates—with CNN Newsource in 1988.

Gannett's USA Today Network, which gathers content from local newsrooms across the country for packaging in the national edition, was rebooted in 2015 to take advantage of the latest technology for sharing content. There was also sharing between smaller newsrooms and organizations; New California Media (later called *New America Media*) began developing collaborative reporting projects in the late 1990s as a way to combine the strengths of ethnic media with those of mainstream journalism. At the local level, newspaper

chains have been *collaborating* for decades; small suburban weeklies share content with the large metro paper and vice versa.

However, there is a qualitative difference in the consciousness and intentionality with which collaborations are now being undertaken. The attention from outside philanthropic organizations, and their money, makes a difference. One major difference in the structure of contemporary collaborations is the presence of a dedicated manager; this person's main job is to run the collaboration, which includes communicating with the various partners, meeting deadlines, mediating disagreements, and identifying efficiencies.

The most recent, most intentional phase of collaborative journalism began in the mid-2000s, when publishers, journalism scholars, and foundations began to look at the opportunities made possible by digital networking. In 2009, an organization called *J-Lab* fostered nine newsroom collaborations, funded by the Knight Foundation. In 2012, University of California-Berkeley's Investigative Reporting Program and PBS MediaShift cosponsored an event on the practice, saying that collaboration was increasingly important to the long-term survival of news organizations. In 2014, Pew Research Center declared it to be "a new era of interest" in journalism partnerships, as they called them. (Research on the topic has called collaborative journalism by several names, including "convergence," "networked journalism," and "news sharing.")

Also, in 2009, the U.S. Corporation for Public Broadcasting (CPB) began funding journalistic collaborations; as of 2020, CPB had put more than \$39 million into 40 local and regional partnerships. The Center for Cooperative Media, based in New Jersey, in 2018 began tracking collaborative journalism projects in the United States and around the world in an online database; the total as of 2020 was 303.

Why Collaborative Journalism Now?

The digital and economic upheavals that begat contemporary collaborative journalism form one reason why many of the most zealous collaborators are young, at digital-native outlets or from outside of the journalism profession. In other

words, practicing successful collaborative journalism very often requires a break with past practices and mindsets. Yet, legacy journalists and organizations are also increasingly participating in and seeing the benefits of collaboration, having experienced the same environments and constraints that smaller newsrooms have.

Investigative, or accountability, journalism is also increasingly practiced through collaborations; perhaps the most famous collaboration, The Panama Papers, was an investigative story that uncovered a global web of financial malfeasance and had a massive impact around the world. Investigative stories are particularly well-suited to collaboration because they require the greatest amount of resources and to have impact often need the expanded reach that collaboration provides.

Likewise, at least in this relatively early phase of contemporary collaborative journalism, nonprofit or community-supported outlets are the most likely to be involved in ongoing collaborative relationships, perhaps because of the millions of dollars from government and philanthropic organizations that have gone into starting collaborations (which usually only fund public and not-for-profit media). Yet, close observers also think that there are other reasons, having to do with economic constraints and the cultural makeup of these outlets; for example, all public broadcast outlets rely for a large amount of their funding on audience revenue, which instills a community orientation.

The trend toward collaborative journalism signifies deeper structural changes in the field of journalism, driven by the ability to connect digitally and the intense economic pressure that the loss of advertising dollars to platforms has engendered. Collaborative journalism is now being practiced

on a scale that constitutes a revolution in journalism. The many trials and errors during the growth of the practice in the 2010s have generated cooperative efforts that have stood the test of time and are showing the way for others. While lessons are still being learned, collaborative journalism has evolved from experiment to common practice.

Six Models of Collaborative Journalism

There are two main elements by which collaborations are organized: duration of time and degree of integration among partner organizations. As both of these increase, the level of commitment required to make the collaboration work also increases. On the *x-axis* are two variations in the *duration* of collaborations: one-time, or finite, projects and ongoing or open-ended collaborations. On the *y-axis* is the *level of integration* of participating organizations: at the lowest level of integration, organizations create content independently and share it; at the next level, they work together to create content; finally, they share resources at the organizational level, indicating the highest level of integration. Although the resulting combinations are fairly distinct, projects can fall into more than one category. Moreover, it is not uncommon for a collaboration to begin as one model but evolve into a different model, usually from finite to ongoing and at a higher level of integration.

Table 1 shows the six models that result from combining the five iterations of the two key variables identified as well as an example or examples of each. Other variables not included in the matrix but which figure in to many collaborations include: the formality of the arrangement (i.e., whether

Table 1 Models of Collaborative Journalism

	<i>One-time/finite</i>	<i>Ongoing/open-ended</i>
Partners create content separately and share it	Temporary and separate	Ongoing and separate
Partners work together to create content	Temporary and cocreating	Ongoing and cocreating
Partners share content/data/resources at the organizational level	Temporary and integrated	Ongoing and integrated

Source: Library of Congress

there is a contract); whether the subject of the collaboration is one topic, or spans many issues; and whether there is a community engagement element.

The Temporary and Separate Model

In temporary and separate projects, participants create content separately and generally have the greatest level of editorial independence, even when working within preestablished guidelines. The content may be aggregated for presentation in one place (e.g., the project's website) or may be presented in several different places (on partners' different platforms or across media). Some projects that fall under this model use a decentralized approach to coordination, which allows them to avoid the problem of competing organizational cultures and priorities. Others have guidelines for what should be produced by participating organizations. Those projects where decisions are not made in advance about who will produce which content tend to be less successful.

The Temporary and Cocreating Model

Temporary and cocreating projects are one-time or finite projects where participants work together to create content. These are necessarily closer and more coordinated than projects in which participants produce content separately. When partners work together to create content, there is potential for conflicting priorities at different newsrooms to affect the collaboration. However, creating content together for a finite project allows organizations to create a product that is greater than what could be created alone, while mitigating the need for partners to coordinate long term. As seems to be the case with finite projects, examples of this model tend to be investigative or accountability reporting pieces.

The Temporary and Integrated Model

The temporary and integrated model highlights finite projects in which participating organizations share data and/or other resources at the level of the organization. This model represents the greatest level of integration for finite projects;

when partners share resources at the level of the organization, they coordinate closely and have regular contact for the duration of the project. Perhaps the best example of this type of collaboration to date is the Panama Papers, where participating organizations all had access to the same data and proprietary software, working together to sort through it, but wrote different stories that were unique to the outlet that produced them, and published on many different sites.

The Ongoing and Separate Model

In the ongoing and separate model, partners create content separately and share it. Journalistic collaborations based on this model include some of the oldest-known collaborations—the early arrangements used by the wire services fall into this category, for example. It's also the model that best characterizes contemporary sharing arrangements by big news corporations such as Gannett's USA Today Network and CNN Newsource. But smaller news organizations—down to hyperlocal online outlets—are also starting to form lasting collaborative relationships. Stories are produced separately, within the editorial and economic structures of individual organizations, but collaborative benefits are realized through cross-sharing and greater impact when topics are simultaneously addressed by multiple outlets.

The Ongoing and Cocreating Model

In this model, partners are involved in an ongoing collaboration where they work together to create content. This means that organizations are more integrated than when they create content separately and share it; usually, there are regular editorial meetings or calls, and there is often a person who oversees the collaboration and regularly communicates with the various organizations involved.

In this model, even if content originates with an individual reporter or station, it will often be worked on and added to by the other collaboration partners. Shared resources like an active project editor or audio from a weekly call with a Congress member mean that partners are working together closely to produce stories on a regular basis. Projects falling into this category have

usually figured out the balance between what is needed and what can be offered and are aided in general by the benefit of addressing similar or overlapping audiences.

The Ongoing and Integrated Model

Projects fitting this model are ongoing collaborations where partners are integrated at the level of the organization. This model is not (yet) very common—but it is an innovative way to address the challenges of the local media landscape. Of those that do exist, several are made up of local outlets that operate independently but are completely integrated for their back-office services such as logistics around accounting, funding, engineering, and membership.

Ongoing and integrated partnerships usually have multiple components that make it work: trust between general managers, news directors, editors, and reporters based on years of working together; sharing a region with similar audiences and contexts; and sharing a need for resources or products that they could not meet on their own.

Collaborative Journalism: Promise and Challenges

In a news and information climate that is at once saturated, yet in many cases starving for resources, collaboration between information providers has become more and more common. From the perspective of many of the players involved—publishers, foundations that support journalism, and communities hungry for quality content—greater journalistic collaboration is a promising trend. However, there are also barriers and resistance; while smaller publishers see many benefits, larger news organizations can be more hesitant. Likewise, it takes a fair amount of heavy lifting up front, and no small amount of trust and goodwill, to keep successful collaborations going.

Because collaborative journalism is still a nascent practice, and a relatively new area for scholars who study journalism, the dividing line between *good* collaboration and *bad* is not yet clearly drawn. Agreed-upon definitions, once they are formed, will allow critics, philanthropists, and practitioners to see clearly when a

collaboration is for the betterment of the communities being served.

COLUMN-WRITING

For much of the 20th century, American newspaper columnists offered readers an extraordinary range of content, especially on public affairs and special interest topics, and in local columns written for the hometown audience. Humor, general interest, and special topics columnists regularly contributed to the growing daily newspaper in the late 19th and early 20th centuries. Increasingly, columnists began to strike a more serious political tone, so that beginning in the 1930s, the American newspaper reader witnessed an explosion of syndicated columnists who offered reporting, interpretation, or commentary on the news, often from Washington, DC, or New York City.

Columnists filled a unique role in the American newspaper. Columnists added a voice to what could otherwise be a collection of lifeless facts. The art of column-writing humanized and enriched the paper, and as papers became more commercial and more corporatized, columnists were thought to help the paper appeal to a mass market audience, whether in a one-newspaper town or in the head-to-head competition once seen in major metropolitan centers. Columnists flourished in the 20th century, especially with the rise of the syndicated columnist in the 1930s. As of 2020, the big-name columnists associated with distributors such as the Washington Post Writers Group and the New York Times Syndicate continued offering high-profile and high-quality opinion pieces. But in the first two decades of the century, newspaper employment declined sharply and many columnists, especially on the local stage, quietly left the field. Political elites and politically engaged readers closely followed the nation's top columnists. Syndicated special interest columnists writing about

health, finance, and a host of reader-focused topics also thrived during much of the 20th century, as did gossip columnists. Up until the early 2000s, most papers of any size also boasted at least one local columnist who offered a familiar voice on life and culture in the immediate area. At many smaller papers, however, the local columnist often was among the early casualties of the sharp decline in newspaper employment after the 2007–2009 recession. This entry discusses the origins of the columnist in American newspapers, newspapers' use of syndicated and local columnists, and the decline of columnists as a result of cutbacks in newspaper employment.

Origins of the Columnist

Columnists have a long history in American newspaper journalism, with some historians placing the origins in colonial newspapers. Certainly, the papers of the Early Republic and the early 19th century contained items that might be considered a prototype of the modern column—politically oriented items appearing regularly and written in a recognizable style with a point of view. The columnist as a journalist distinct from a reporter or editorial writer had its origins in the development of the commercial press and the division of labor that evolved during the last half of the 19th century. Metropolitan papers in New York, Boston, Philadelphia, Detroit, and elsewhere began to carry regularly appearing columns signed by a familiar name and written with a personal touch. Sam G. Riley, in his 1998 book *The American Newspaper Columnist*, noted that the earliest columnists included women writers, literary figures, and humorists.

Columnists found a home in a newspaper that was increasingly compartmentalized and market-driven. Newspapers in the late 19th century were greatly expanding the breadth and volume of content to include sections for women, sports, finance, and comics while at the same time drawing more rigid boundaries between news and editorial opinion. Nineteenth-century columnists were known for their voice, often a folksy style, for humor and clever observations and for their poetry or literary talents. Although journalism was primarily a male occupation, women writers, such as Sara Parton, a feminist who wrote a satirical column from New

York in the third quarter of the century under the name Fanny Fern, were recruited to appeal to the urban housekeeper/consumer. Political topics largely remained in the purview of the editor or editorial opinion writer.

The Rise of the Syndicated Political Columnist

By the 1920s, however, the political columnist was on the rise, although the humorist, such as Will Rogers, and general interest columnist such as O. O. McIntyre, who wrote features from New York throughout the 1920s and 1930s and was syndicated in more than 500 newspapers, remained popular. Franklin P. Adams wrote his column, "The Conning Tower," using contributions from readers, for New York papers for more than two decades, beginning in 1914. The growth of the political columnist in part sprang from the birth of the op-ed page at the *New York Evening World* in 1921. Editor Herbert Bayard Swope reasoned that readers would be interested in well-written columns on the arts, and especially, on political issues of the day. He created a home by clearing the page opposite the paper's own daily editorials. Among the early recruits for this endeavor was Heywood Broun, a former sportswriter. Broun would eventually lose his job at the *World*, in part for his columns on the murder conviction of the anarchists Nicola Sacco and Bartolomeo Vanzetti in 1927. After landing at the *New York Telegram* as a syndicated columnist, Broun went on to found the American Newspaper Guild. He was not alone, of course. Other early 20th century columnists who offered regular commentary on public affairs included Mark Sullivan, David Lawrence, and beginning in 1931, Walter Lippmann who for nearly 40 years would be considered the dean of newspaper columnists.

Reasons for Success

Spurred on by the successes of the pioneers, numerous syndicated columnists appeared in the early 1930s. Not all wrote exclusively on political topics. Gossip columnist Walter Winchell began a column in the *New York Mirror* in 1929 and also appeared on radio and eventually television. Hedda Hopper, who was active in the blacklisting

of actors and writers in the anti-Communist post-war years, wrote a Hollywood gossip column for three decades beginning in the mid-1930s. Still, interpreting events for readers, and commentary on the news, especially out of Washington and about the programs that were part of President Franklin D. Roosevelt's New Deal, was the dominant trend among columnists. The rise of syndicated political columnists can be traced to several developments within the newspaper industry. First, editors and publishers recognized a significant public interest in news of the day, especially in understanding the roots of the Great Depression and in the greater role of the federal government in their daily lives. In addition, the newspaper was facing competition from radio and the immediacy and emotion of broadcasting. Second, economy-minded publishers understood that a well-written and relatively inexpensive column from a syndicated voice was far cheaper than sending their own reporter to Washington or hiring a correspondent. Syndication rates were such that a small paper in Pennsylvania might be able to run a major Washington columnist in the early 1940s for as little as \$5 per week, and even the major metros might spend only \$35 per week to have access to an 800-word column five or six times a week. Rates were such that papers could afford to oversubscribe and pick from the best available. Third, the newspaper industry was under pressure to include more interpretive reporting. Academics and professional press critics argued that the so-called objective news style of the day, where stories were dependent on events and the sources who commented on them, was inadequate to explain the complexity of modern life to the average newspaper reader. The columnist was charged with interpreting the facts for readers. Finally, the newspaper was becoming less a personal instrument and more of a mass market business, with a goal of reaching the largest audience possible by finding a middle path. Publishers understood that having liberal and conservative voices within the paper might attract a broader readership and might be useful in insulating themselves from charges of political bias in the paper. Publishers could also claim they were not responsible for unpopular syndicated columns. Still, despite their vaunted independence, columnists had to please the head office. Indeed, Dorothy Thompson, who

wrote of foreign affairs and had a popular nonpolitical column in *Ladies Home Journal*, and the fire-breathing anti-New Deal columnist Westbrook Pegler were among those who lost their jobs in conflicts with their home papers.

Syndication

By the end of the 1930s, hundreds of columnists were syndicated with the Post-Hall Syndicate, King Features, United Feature Syndicate, and others. Columnists might appear in 200 papers with a total combined circulation of 6–10 million. The columnists Drew Pearson and Robert Allen, authors of the “Washington Merry-Go-Round,” were said to appear in 12 million papers, which would have been almost one third of total daily circulation of all papers in the United States. Some relied more on reporting than commentary, some offered an interpretation of why something happened or what it meant, and others just repackaged facts to fit a point of view. Not all columnists were journalists. Among the more popular in the 1930s was First Lady Eleanor Roosevelt, whose syndicated “My Day” column appeared from 1936 to 1962. Columnists could be handsomely rewarded for their work, with reported income from columns, books, lectures, and radio commentary in the late 1930s topping \$50,000 annually, which in 2020 would have a buying power of about \$1 million.

By 1940, the national, syndicated, politically oriented columnist had become as much of a fixture in the daily newspaper as the comics, and they generally were allotted more space than the local editorial writers. Although critics derided the growing presence of syndicated columnists in local papers, editors at smaller papers argued that they could not keep up with national and world affairs and defended the columnist as a valuable addition to the paper. The development of hostilities in Europe and elsewhere in the years leading up to World War II, and the heated debate in the United States about American involvement in the war, only heightened the appeal of columnists such as Anne O'Hare McCormick, who wrote about world affairs. Some columnists went to cover the war firsthand. Raymond Clapper, a highly respected newspaper columnist and radio commentator, lost his life when his plane crashed in the Marshall

Islands in February 1944. The celebrated columnist Ernie Pyle, the voice of the foot soldier, was killed when his plane was attacked approaching a Pacific island war zone in April 1945.

Influence of the Columnist

It is not clear how much influence the columnists had over the general public, but they were closely watched by opinion leaders and politicians. According to survey research conducted in the 1940s, a majority of readers did not follow the great political columnists of the day. Pearson, Roosevelt, and Pegler were among the most read columnists, but even they were passed over by many readers. Lippmann, the great sage of the era, was not writing for the average reader. Lippmann wrote for, and wanted to be read by, elites. His prestige was based on who read his “Today and Tomorrow” column, not based on how many read it. With the onset of the Cold War after the end of World War II, columnists wrote more often about geopolitical affairs. In the mid-1950s, columnists Joseph and Stewart Alsop were among the early voices for American involvement in Vietnam to contain the threat of Communism after the fall of the French at Dien Bien Phu. But others, such as Lippmann and publisher/editor John S. Knight, whose “Editor’s Notebook” was carried in all the Knight papers, were early opponents of the war in Southeast Asia. By the mid-1960s, Joseph Alsop and Lippmann offered readers, including President Lyndon Johnson, sharply contrasting views on whether to increase a military presence or withdraw from Vietnam. National columnists based at *The New York Times*, *The Washington Post*, and elsewhere thrived during the last half of the 20th century, and if anything, their stature grew, as James Reston, William Safire, David Broder, and many others were showcased in daily papers. In the *Columbia Journalism Review* in 1966, media observer Ben Bagdikian described the prominence of the columnist in American newspapers under the title “The Golden Age of Oracles.”

Local Columnists

At the same time, most local papers of any size had at least one columnist who contributed regularly scheduled general interest or local feature columns.

These columnists were thought to give the dry news pages some personality, and they were chosen not only for their reporting and writing abilities but also for their keen sense of place. Indeed, even midsized daily papers in the later years of the 20th century might have two columnists who would write and appear in metro sections on alternating days. Most of these columnists were not syndicated, and if they were, they might have a regional distribution, but not a national one, and their primary audience was the hometown reader. Columnists wrote about more than political news, of course. Columns on sports had their own following and appeal. Sylvia Porter offered financial advice from the late 1930s, at a time when the field was still dominated by men, to the early 1990s. Erma Bombeck wrote “At Wit’s End,” a widely syndicated humor column, for more than 20 years, beginning in the mid-1960s. Jane Brody began writing a personal health column for *The New York Times* in the mid-1970s. And many syndicated writers, such as the *Boston Globe*’s Ellen Goodman or Leonard Pitts of the *Miami Herald*, offered opinion on a wide variety of topics at the end of the 20th century. Columnist Mike Royko worked from his home base in the Chicago papers, and though he often wrote about the city, he was syndicated in more than 500 papers across the country when he died in 1997.

The Decline of the Columnist

In the first two decades of the 21st century, the local newspaper columnist, as well as those self-syndicated, fell on hard times. The newspaper industry radically contracted after the recession of 2007–2009. Circulation, which had been on a slow downward trajectory since the middle of the 1960s, dropped from more than 50 million on weekdays in 2007 to an estimated 28 million in 2018, according to data compiled by the Pew Research Center. Year-over-year declines in advertising revenue were even more staggering, as volume went from more than \$45 billion to just \$14 billion during the same period. At the same time, newspapers across the country gave in to the push or led the charge to offer content for free on the paper’s website. Especially in the second decade of the 21st century, local general interest columnists were victims of cost-cutting measures as

newsroom employment in newspapers dropped from nearly 74,000 in 2007 to fewer than 40,000 in the late teens. Some columnists were reassigned to traditional news work or left the paper altogether, in some cases with a buyout and retirement package. Those who thought of themselves as columnists, as represented by membership in the National Society of Newspaper Columnists, increased between 2000 and 2020. However, by then, membership included a growing number of writers working exclusively online.

COMCAST

Comcast Corporation is a global media and technology company with its main headquarters in Philadelphia and corporate offices in New York and London. It is a vertically integrated conglomerate with operations and subsidiary companies spanning across industries and roles in the production, distribution, and exhibition of news, entertainment, and information. It provides cable television and telecommunications services to residential and business customers. It operates cable- and satellite-delivered television networks and online video streaming applications for national and regional markets. It runs broadcast TV networks and stations. It produces and distributes filmed entertainment in the United States and abroad. And it owns or manages entertainment venues, including theme parks and sports stadiums.

Most of Comcast's business is in the United States, where it is the largest provider of both pay-TV and Internet services. The company's international footprint has expanded in recent years, first with its purchase of NBCUniversal (NBCU) in 2009, and again in 2018 with its acquisition of Sky, a leading European provider of many of the same services and products Comcast offers in the United States. This entry provides an overview of Comcast and details on its main business segments. It then discusses the NBCUniversal News Group, Comcast's growth through acquisitions, and controversies involving the company.

Among Comcast's holdings most immediately relevant to journalism are the NBC and Telemundo broadcast networks (and their owned-and-operated local stations); the MSNBC, CNBC, and E! cable networks; and the NBC Sports Group, which includes nationally distributed channels (NBCSN and Golf Channel), a cluster of regional sports channels available to subscribers of local cable systems, and ownership stakes in the MLB and NHL networks. Comcast also has substantial equity investments in digital media and news companies BuzzFeed and Vox Media. Since 2017, BuzzFeed and Vox Media have been among the many news organizations experiencing labor turbulence; both have made large cuts to editorial staff and conceded to successful unionization campaigns by news workers.

Major sources of revenue for Comcast come from subscriptions to Internet, pay-TV, and other telecommunications services; advertising sales on broadcast and cable television; distribution and licensing of television programming and motion pictures; and fees from the carriage and retransmission consent agreements negotiated between pay-TV providers and Comcast's cable networks and broadcast stations. In 2019, Comcast reported \$108.9 billion in revenue and more than \$13 billion in net income. That year, the company spent \$6.1 billion to advertise its own products and services in the United States, more than any advertiser except Amazon. Because U.S. firms can deduct advertising expenditures from their federal tax bills, Comcast enjoys a government subsidy on this large outlay while also benefiting from the stimulus these subsidies provide for the advertisers who patronize Comcast's media businesses. Brenton Malin (2020) calls this "America's hidden public media system" and lists Comcast among its top beneficiaries.

Ralph Roberts and his associates founded the company now known as *Comcast* in 1963 when they bought a cable system with 1,200 subscribers in Tupelo, Mississippi. Comcast expanded over the following decades by purchasing competing cable TV providers. When Brian Roberts, the founder's son, took over as president of the publicly traded company in 1990, Comcast had more than 2 million subscribers. Following its acquisition of AT&T Broadband (formerly *Tele-Communications Inc.*) in 2001–2002, Comcast became the largest U.S. cable operator, with more than 22 million subscribers. As of 2020, it ranks 28th on *Fortune* magazine's list of the top 500 public companies, as measured by revenue. Brian Roberts, now Comcast's chairman and chief executive officer, controls special Class B "super-voting" stock that gives him unimpeachable power over company decisions. Roberts's salary in 2019 was more than \$36 million and his net worth is reportedly \$1.8 billion.

Business Segments

Comcast's operations are divided into three main business segments: Cable Communications, NBCU, and Sky. The company also launched in 2020 a new video streaming service called *Peacock*, one of several related initiatives.

Cable Communications

First and foremost, Comcast is a cable and telecommunications company, delivering high-speed Internet, multichannel television, and other services to subscribers' homes and offices. Since 2010 Comcast has bundled residential products under the brand name *Xfinity*. At the end of 2019, Comcast reported 31.5 million customer relationships, and it led all its domestic competitors in providing Internet services (19.1% market share, 26.4 million residential customers) and cable TV (21.7% market share, 20.3 million residential customers). Cable Communications contributed 52% of Comcast's revenue in 2019, with a high operating margin of 40.1%.

As pay-TV subscriptions have been declining in the United States as customers replace costly cable packages with cheaper and more flexible Internet-delivered video-on-demand services, Comcast has made high-speed Internet the engine of its growth. In fact, the migration to online video streaming increases the demand for broadband Internet, and cable operators remain the predominant option for most homes in the United States to access download speeds sufficient for watching video content at a quality comparable to other modes of transmission. Losses in video customers and rising programming costs have been offset by growth in broadband subscriptions and price increases passed on to customers. The Cable Communications segment is also involved in selling advertisements on Comcast properties and providing advertising and marketing services (e.g., technology platforms and data analytics for behavioral targeting) to other companies.

NBCU

NBCU is an international producer and distributor of news and entertainment. It is subdivided into four units. The Cable Networks unit comprises 12 nationally available pay-TV channels, a collection of regional sports and news networks, and digital properties, such as websites hosting video programming. More than half of its national cable networks are available in at least 80 million U.S. homes, including MSNBC and CNBC.

The Broadcast Television unit includes the NBC and Telemundo networks and their owned-and-operated stations. NBC distributes news and entertainment across more than 200 affiliated stations. It owns 11 of those stations, including in eight of the country's 10 largest markets, such as New York (WNBC), Los Angeles (KNBC), Chicago (WMAQ), Philadelphia (WCAU), and Dallas-Fort Worth (KXAS). Telemundo produces, acquires, and distributes Spanish-language programming domestically across a network of 30 owned stations and more than 60 affiliates as well as for international markets.

The Filmed Entertainment unit is involved in making and marketing motion pictures under brand names such as Universal Pictures, DreamWorks Animation, and Focus Features. These films are exhibited in theaters, in retail stores and kiosks, and by multichannel video providers, including the company's own operations. Filmed Entertainment also includes Fandango, which functions primarily as an online retail vendor of movie theater tickets, but also houses related businesses, such as Rotten Tomatoes, an aggregator of film reviews.

NBCU's Theme Parks unit runs recreation destinations in the United States and abroad. These parks license intellectual property from Universal Studios to design attractions and sell merchandise based on the company's popular movie franchises and brands.

Sky

Sky is a media conglomerate operating in the United Kingdom, Ireland, Germany, Austria, Switzerland, and Italy. It provides subscription to multichannel video services, mostly delivered by direct-to-home satellite. Among the channels available on these services are a handful of the company's own news, entertainment, and sports channels. The company provides Internet connectivity to customers in the United Kingdom and Ireland. Like Comcast's Cable Communications segment, Sky also sells advertisements and ad targeting and analytics services.

New Video Services

Just since 2020, Comcast has either purchased or initiated several new Internet-delivered video

services that complement or substitute for traditional cable television offerings. Peacock is a streaming video service supported financially by advertising and subscription revenues. The initiative takes advantage of the content assets belonging to the business segments listed above, including NBCU's news and sports programming, as well as the cable segment's existing customer relationships. Peacock was first made available for free to some Comcast Xfinity subscribers in the spring of 2020. Reportedly 15 million users had signed up for Peacock by September 2020.

In February 2020, Comcast announced its acquisition of Xumo, an advertiser-supported streaming service that gives users free access to live and on-demand content organized in categories such as news, sports, and fashion. At the time of the purchase, the service claimed to have 10 million monthly users. Later, in July, Comcast completed its purchase of the streaming and video rental service Vudu from Walmart. Vudu, now part of the Fandango subsidiary, features a large catalog of new and old movies and television shows that can be bought, rented, or watched free with ads.

NBCUniversal News Group

NBCUniversal News Group is the company's news division. Organized under this name in 2012, it comprises NBC News, CNBC, and MSNBC. NBC's news programming has a storied history beyond its ownership by Comcast. The *NBC Nightly News* has been on the air since 1970. The weekly news and interview show, *Meet the Press*, is the longest-running program on U.S. television. The *Today* show pioneered the morning news and talk show format, beginning in 1952. Longtime cohost Matt Lauer was fired from *Today* in 2017 due to allegations of workplace harassment and sexual assault.

Despite reports that the organization had tolerated complaints about Lauer's misconduct for years, *Today* remains popular with advertisers. *Today*, like other network morning news programs, is a financial tentpole for the entire news division. As *Today* and MSNBC's *Morning Joe* lose viewers to other platforms and information sources, these morning shows have tended toward more hard news coverage and more diverse

formats for engaging audiences, such as social media and satellite radio.

Acquisitions

Comcast's position as the top cable operator in the United States has come largely through mergers and acquisitions, including deals with Westinghouse's Group W Cable (1986), Storer Communications (1988), E.W. Scripps (1995), Jones Intercable (1998), Lenfest (2000), and AT&T Broadband (2001–2002).

Comcast has also bought its way into the programming business. Its best-known move was buying NBCU. The deal was announced in 2009, approved by the Federal Communications Commission (FCC) in 2011, and completed in 2013. By absorbing one of the world's largest entertainment companies, Comcast gained control over a trove of content assets to bolster its cable service offerings, including new channels and more movies and TV series to exhibit via pay-per-view rentals and video-on-demand. The deals faced vocal opposition from critics who worried that this vertical integration of programming and distribution would allow Comcast to disadvantage competitors and customers in both business areas. Observers also feared that Comcast could leverage its role as an Internet service provider to give preferential treatment to NBC-related content. Despite these concerns, the deal was approved, with Comcast agreeing to concessions intended to preserve competition and extend Internet access to underserved communities.

Comcast made another big splash in 2018 by acquiring Sky. As Comcast's U.S.-based pay-TV business was losing customers, the Sky deal brought the company 24 million new subscribers in Europe, more than doubling its global video customers. Sky is also an entertainment and news conglomerate. It owns channels and programming assets delivered to customers through its own pay-TV services or via licensing agreements with other video providers. Sky mirrors Comcast as a vertically integrated media giant; the acquisition both extends Comcast's business internationally and offers potential opportunities to take advantage of the complementary programming and distribution properties held under single ownership.

Comcast's record of acquisitions also includes well-publicized failures. It made an uninvited and unsuccessful bid to purchase Walt Disney in 2004. Disney rejected the \$54 billion takeover. In 2014, Comcast reached an agreement to buy Time Warner Cable, the second largest cable operator in the United States. After skidding out in a legal morass stemming from antitrust concerns, the deal was abandoned in 2015. Comcast clashed again with Disney in 2017–2018 in a contentious bidding war to buy 21st Century Fox, another massive media conglomerate. After Disney and Fox reached a merger agreement, Comcast topped Disney's \$52.4 billion stock offer with a \$65 billion cash bid, only to be outmaneuvered when Disney sweetened its first bid by more than \$18 billion.

Controversies

Antitrust

Comcast faces little or no competition in many of the markets where it offers cable television and Internet services. This has raised concerns about monopoly (the power to dictate terms of sale) and monopsony (the power to dictate terms of purchase). Where subscribers lack the option of switching to a competing provider, Comcast can set the prices and quality of its services, respectively, above and below competitive levels. This also presents problems for the distributors of news and entertainment. Cable news channels, for example, generate revenue by selling advertising and by collecting carriage fees from the video providers exhibiting these channels, usually on a per-subscriber basis. Both revenue streams depend on the number of consumers accessing a channel, and therefore, it is important for cable channels to make carriage agreements with large cable operators. With more than 20 million subscribers and a monopoly franchise over cable services in many regions, Comcast often has leverage over programmers in these negotiations. This power extends to Internet-delivered services needing to reach customers. For example, in 2014, Netflix agreed to pay Comcast for direct interconnection into its networks to ensure the former would be accessible to and properly functional for Comcast customers.

Comcast has also been accused of using its ownership of programming assets to disadvantage

other pay-TV providers. By denying other pay-TV providers access to the popular channels or programs they need to attract subscribers, or by allowing access on unfavorable terms, Comcast may be able to improve its competitive landscape. Comcast's power is especially acute where its regional sports networks have exclusive rights to distribute professional sports games in those markets. Most famously, in its hometown of Philadelphia, where it owns the Flyers NHL team and the building they play in, the local sports network is not carried by satellite TV providers, like DirecTV.

Cable distributors are required by law to give satellite providers fair access to programming; for years, Comcast successfully denied satellite companies the opportunity to carry its Philadelphia sports network by exploiting a technical loophole in the 1992 Cable Television Consumer Protection and Competition Act. The loophole was closed in 2010, but the channel remains unavailable to satellite customers. This means that city residents wishing to watch their home teams have no choice but to subscribe to Comcast. Industry analysts believe this strategy has depressed satellite subscriptions in Philadelphia, to Comcast's benefit.

Net Neutrality

Net neutrality is the principle that Internet service providers should treat all traffic equally. As both an ISP and a major owner of news, entertainment, and sports content, Comcast could be inclined to prioritize traffic that benefits its businesses and to discriminate against competitors' sites or network uses that conflict with Comcast's interests. Even before acquiring NBCU, Comcast was found to be interfering with customers' usage of peer-to-peer file sharing. From 2010 onward, Comcast has been an active opponent of U.S. efforts to create net neutrality laws, typically citing its need and responsibility to manage its network resources and warning that these rules would force the company to curtail investments in infrastructure and service improvements. Comcast claims that it does not engage in any blocking, throttling, or prioritization of sites and traffic, while critics maintain that its capacity and incentive to do so remains, checked only by net neutrality rules.

Politics and Lobbying

Comcast's main enterprises are in industries or sectors that are highly sensitive to the form and extent of government regulation, including telecommunications and broadcasting. Comcast consistently ranks among the top annual spenders on political lobbying in the United States, particularly in years when the government is considering important policy decisions. Comcast's interests are also represented by the NCTA—The Internet & Television Association, another of the country's biggest lobbyists, where Comcast executives have occupied prominent positions. Brian Roberts served multiple terms as chairman of the NCTA board of directors (1995–1996 and 2005–2007); Dave Watson, the CEO of Comcast's Cable segment, holds that chair in 2020.

Comcast also leverages personal and professional relationships to influence policy-making and regulation. The company employs former members of Congress and former regulators from the agencies that oversee industries where Comcast participates. In one notorious example, just months after the FCC approved the Comcast-NBCU merger, commissioner Meredith Attwell Baker left the FCC to become NBCU's senior vice president of government affairs. She was hired to the role by Kyle E. McSlarrow, a former deputy secretary of the U.S. Department of Energy and NCTA president. Comcast's top management maintained close relationships with President Barack Obama. Roberts was a member of the President's Council on Jobs and Competitiveness, and senior vice president David Cohen was one of the biggest fundraisers for Obama's 2012 reelection campaign.

COMICS

Comics, also known as *comic strips*, *funnies*, *printed cartoon art*, or *comic art*, have been a key element of the newspaper business since the end of the 19th century. They were an important reason for the economic success of many newspapers entering the modern age, a socialization device for both newspaper reading and social mores, an economic and cultural force outside of the newspaper industry, and viewed as a way to attract and maintain a youth readership. The future of the comics in the digital era, similar to the future of the newspaper medium, is unclear.

Comics through the 20th century were a key part of the fabric of American culture and everyday life. Newspaper editors historically faced a serious dilemma when dropping or adding a strip, given the loyalty readers felt—and expressed—toward particular comics. Many Sunday family rituals involved reading the color comics section, and exposure to daily comics characters had an enduring effect on successive generations of fans. Major character and plot developments, including character deaths (Mary Gold in *The Gumps* or the family dog Farley in *For Better or For Worse*), weddings (Dick Tracy to Tess Trueheart), and trauma (B.D.'s loss of a leg in the Iraq War in *Doonesbury*), often spark deep emotional reactions in readers. Comic-strip characters and phrases have transcended the medium to the point where their comic-strip origin is not universally known. Characters such as Buster Brown, Little Orphan Annie, Popeye, and Charlie Brown,

although beginning as comic strips, are perhaps better known for their cultural presence in other forms (in the aforementioned cases, as a shoe brand, Broadway musical, and film/TV characters, respectively). Moreover, comic strips have popularized, if not wholly created, familiar words and phrases in the American lexicon such as “keeping up with the Joneses,” jeep, Sadie Hawkins Day, security blanket, hot dog, and baloney.

After reviewing the origins of comics, this entry discusses various comics genres and styles as well as the association between comics and media syndicates. The entry also discusses comics as social–political commentary. The entry ends with a review of the scholarship on comics and at a look at future challenges.

Origins

No single creator invented the newspaper comic strip. The use of illustrations combined with words, sequential panels, color, and regularly occurring characters appeared in European and U.S. publications through much of the 1800s. Nevertheless, many comics historians attribute at least the popularization and commercial viability of these graphic and narrative characteristics to *Hogan’s Alley* (later featuring and known as *The Yellow Kid*), created by Richard F. Outcault and first appearing in Joseph Pulitzer’s *New York World* in 1895 (see Figure 1). Also subsequently published in William Randolph Hearst’s *New York Journal*, the character became a national sensation through heavy licensing activity (such as appearances in advertising and on Broadway) and the national distribution of Hearst’s Sunday humor section. Other developments soon followed as comics grew, including daily publication and national syndication. The latter allowed newspapers that could not afford their own printing technology or artistic talent to offer comics to their readers as well as give comics characters and trademarks national exposure.

The *Yellow Kid* and other early examples of groundbreaking comics (*The Katzenjammer Kids*, *Happy Hooligan*, *Mutt and Jeff*, *The Gumps*) developed and illustrated the symbiotic relationship between comics and newspapers. On one hand, as a part of the newspaper that overtly emphasized entertainment rather than hard-news

journalism, comic strips became an important booster of newspaper circulation and one way that children were first exposed to the medium. On the other hand, newspapers served not only as the primary revenue source for comics, at least at first, but also as a popularizer and promoter for character licensing and merchandising, a trend that became more dominant later.

Genres and Styles

Several different types of comics were found in newspapers, although some genres became more prominent during different eras. Gag strips focus on a punch line or humorous situation each day,

with characters changing little over the years. Continuity strips often follow plotlines or evolving character developments over weeks, months, or even longer. In some cases, characters aged in real time, like the early example of *Gasoline Alley* or later in *For Better or For Worse* (see Figure 2). Continuity strips tend to involve more serious topics (e.g., adventure or domestic relationship oriented); however, hybrid strips like *Funky Winkerbean* include characteristics of both gag and continuity. Within each of these two major genres, there are several subgenres, such as family, adventure, sports, workplace, kid, and talking-animal strips. Likewise, drawing style can vary from the detailed (*Little Nemo in Slumberland*) to the simple (*The Far Side*) to the realistic (*Prince Valiant*) and to the cartoony or stylized (*Dilbert*). Some strips, like *Liberty Meadows* with its mix of realistic humans and funny animals, blended different styles.

One historical trend is a shift away from adventure and serious continuity-oriented strips

and toward gag strips, perhaps the result of television's quicker pace, which the syndicates may believe have shortened the patience of readers, and the rise of graphic novels, in which long-form narratives are now commonly found. Similarly, simplified drawing style, as exemplified by Charles Schulz's *Peanuts*, is much more dominant than the previous illustrator styles of such strips as *Buck Rogers* or *Tarzan*, a result of the shrinking newspaper space devoted to comics and increased emphasis on licensing activity that rewards characters easily transformed into toys or other media.

Syndication and Licensing

The linkage of comic strips to syndication companies affected the reach and the form of comic strips. Although syndicates allow for national exposure and can greatly enhance the income of comic strip creators, the gatekeeping power of syndicates may also have encouraged a "mainstreaming" of issues and perspectives to create a "lowest common denominator" appeal and avoid offending publishers, editors, readers, and advertisers. To allow himself to address more political issues in such an environment, Walt Kelly, creator of the often satirical *Pogo*, was known to provide apolitical gag strips that nervous editors could substitute for especially controversial installments. However, in 2001, Frank Cho, creator of *Liberty Meadows*, purportedly stopped creating comic strips for newspapers because he was frustrated with the lack of creative freedom. The influence of individual syndicates over newspapers, although still significant, has perhaps been lessened over the years as one-newspaper towns became the norm and large chains consolidated newspaper control (similar concentration was a trend in syndication organizations). Copyright and license ownership is also important in the history of comic strip production, with syndicates often controlling licensing activities and creators serving as "work-for-hire" employees for the syndicates, although very well-paid ones in some cases. In the 1980s, many high-profile creators worked to retain ownership of their creations. In the modern era, major comic-strip syndicates include Hearst's King Features Syndicate (*Blondie*, *Dennis the Menace*), Andrews McMeel Syndication (*Doonesbury*, *Garfield*,

FoxTrot), and Creators Syndicate (*B.C.*, *Wizard of Id*, *Agnes*).

Comic-strip characters since the 1890s have been ripe for merchandising activity through toys, games, and clothes, as endorsers for products in advertisements, and through the licensing of characters into other media such as film, television, and comic books. Buster Brown is an early example in which licensing was used to promote and commercialize a comics character from its inception. Through the 1980s, comic strips offered more source material for the motion picture industry than did superhero-based comic books, as illustrated by Columbia's Blondie movie series. With the dominance of television and the success of comic-strip compilations in book form—both trends especially visible in the success of Charles Schulz's *Peanuts*—licensing and merchandising is now an assumed, permanent, and institutionalized part of comics. Many radio and television programs have been based on comic strips, such as *The Boondocks*, *Baby Blues*, *Dilbert*, and *Garfield*. The integration of comic strips and licenses also works the other way: Many comic strips have been developed to exploit a successful license from another medium. This trend began in the early years of comics with strips featuring Charlie Chaplin's tramp character and later *Mickey Mouse* and *Tarzan*, but it accelerated with television and licensing-oriented multimedia conglomerates. Strips have been created, for example, from such film and television characters as Spider-Man, The Flintstones, Star Wars, and Teenage Mutant Ninja Turtles.

Politics and Ideology

Comics are also political and ideological artifacts. Several scholars have suggested that comic strips, given their popularity and combination of verbal and visual elements, are particularly appropriate for study as forms of culture that can either uphold or critique the sociopolitical status quo.

Comic strips have long dealt with social issues in both the more serious continuity strips (such as in *Judge Parker* or *Rex Morgan M.D.*), and in hybrid gag/continuity strips like *Funky Winkerbean*, *Mutts*, and *For Better or For Worse*, focusing discussion on such topics as alcoholism, animal rights, mental illness, and literacy. Taking

their cue from editorial cartoons, strips have also commented on the contemporary political scene, either allegorically (*Little Orphan Annie* from the right, *Pogo* from the left, and the more mixed case of *Li'l Abner*) or explicitly, such as the modern examples of *Doonesbury*, *Bloom County/Outland/Opus*, and the right-leaning *Mallard Fillmore* which often feature real political figures as characters or as topics for commentary. Comics have also commented on war, either literally (including patriotic portrayals throughout World War II or with a more critical eye in the case of *Doonesbury*) or metaphorically (implied through children's play or sports portrayals). In the case of the Army gag strip *Beetle Bailey*, the absence of conflicts such as Vietnam sanitized military life.

Comics may also be politically relevant in a broader sense by highlighting and legitimizing certain social groups and social practices over others, including representations of gender, race, sexual orientation, class, and consumption. Family and domestic comics reproduce images of traditional patriarchal family structures, presenting sex role stereotypes and perpetuating gender inequality. Many comics present women as main characters (*Mary Worth* and *Cathy* to name but two), but female characters tend to be underrepresented overall though overrepresented in the home and in childcare activities.

Throughout much of the 20th century, characters who were people of color were either underrepresented in comics or were presented in negative stereotypes. Prior to World War II, African American and Asian characters appeared infrequently in comics and when they did they were depicted as almost subhuman, unable to participate in the social system, and in service roles. The appearance of people of color in comic strips diminished after World War II, perhaps because of an unwillingness to be reminded of societal inequalities after a war fought for freedom and equality and in a booming postwar economy. In the 21st century, comics still underrepresent African American experience. Gay characters remain largely absent from mainstream newspaper comics, but when they appear they are usually male and depicted as assimilated into heterosexual culture or are presented in such a way to evoke nervous laughter. Gay women, transgender individuals, and LGBTQ people of color are almost entirely absent.

In response to negative or missing portrayals, minority newspapers often featured strips about situations more central and realistic to a particular group's everyday life. African American newspapers such as the *Chicago Defender* offered comic strips drawn by African American creators throughout the middle of the 20th century. In response to the dearth of gay characters, publications such as *The Advocate* and LGBTQ "alt-weekly" newspapers featured gay-themed comics, dealing much more fundamentally and frankly with issues of gay life, such as Howard Cruse's *Wendel* and Alison Bechdel's *Dykes to Watch Out For*. Today, people of color remain underrepresented in comics, but characters are included in a broader array of settings and occupations. Starting with Morrie Turner's *Wee Pals* in the 1960s, other comics including *Luther*, *Quincy*, *Curtis*, *The Boondocks*, *Secret Asian Man*, *Candorville*, and *Cafe Con Leche* feature people of color as main characters. *Welcome to the New World*, launched by *The New York Times* in 2016, reports on the true-life experiences of a family that emigrated from Syria to the United States.

Although the history of comics offers significant exceptions, like the early portrayal of class differences and slum life in *The Yellow Kid* or the much later *Agnes* about an impoverished little girl living in a trailer park, mainstream comics remain focused largely on the white middle class. Typical examples are *Blondie*, *Hi and Lois*, and *Family Circus*. Capitalist values are commonly found in comics. For instance, comic strips were important in helping shift American culture from a producer to a consumer orientation during the first half of the 20th century. Comics such as *Gasoline Alley* and *Winnie Winkle* commented on and taught middle- and working-class readers the appropriate way to consume while constructing reader identities around the purchase and consumption of goods and services. *Dilbert* perhaps offers a more cynical view of the capitalist workplace by focusing on the dehumanizing experience of a white-collar worker. Some suggest that *Dilbert* helps workers cope with the absurdities of the workplace while also providing a mild ideological critique, while others suggest that the strip offers an emotional salve that discourages action and social change.

Scholarship

The serious study of comics has grown from the occasional early work in the mid-20th century to a steady interdisciplinary and international output in recent decades. Coulton Waugh's 1947 book *The Comics*, although seen by many contemporary researchers as making the occasional dubious historical claim, nevertheless is the first serious attempt to bring scholarly coherence to the form. Scholars in the 1970s studied comics as part of the growth of popular culture studies, including Russel Nye, Arthur Asa Berger, M. Thomas Inge, and John Lent. Scholarly journals include *The International Journal of Comic Art*, *Inks: The Journal of the Comics Studies Society*, *The Comics Grid: Journal of Comics Scholarship*, *European Comic Art*, and *Journal of Graphic Novels and Comics*. Several academic libraries have extensive comic art collections, including the Comic Art Collection at Michigan State University and the Billy Ireland Cartoon Library & Museum at Ohio State University. Researchers also influenced by the cultural importance of comic books discuss comic art scholarship at such fora as the Comic Art & Comics Division of the Popular Culture Association, the International Comics Art Forum, the Comics Studies Society, and the Comics Art Conference held during the Comic-Con International annually in San Diego, CA.

Future Challenges

Comics are still a key part of most newspapers and regularly read by many newspaper readers. Newspaper personnel see the comics section as a way to attract young readers, a factor of key importance both in terms of newspapers' future longevity and the medium's attractiveness to advertisers. Yet the space for comics in newspapers has shrunk over the decades, as has the number of newspapers. In addition, certain strips, which have existed for decades as new artists and writers have replaced earlier generations (such as with *Blondie*) or are rerun with a "Classic" label (such as *Peanuts*), limit the space for new strips. Culturally, characters from comic books are more popular and well known than comic-strip characters as comic art in the 21st century.

Unclear is the extent to which the future of comics will continue to be linked to the future of newspapers. Digital technology allows for the creation, promotion, and distribution of new digitally created and distributed comics, and the enhanced fidelity and interactive component of digital media may open up new creative possibilities. Distributors and some syndicates have worked to commercialize the Internet and other digital outlets for the strips they control; Andrews McMeel Universal's GoComics and King Features' Comics Kingdom are examples that generate revenue autonomous from newspapers.

In the digital era and with the decline of newspapers, comics creators have searched for additional sources of revenue beyond the traditional relationship with newspapers. Digital platforms such as Patreon facilitate financial support for "webcomic" creators directly from fans. Creators also may link funding mechanisms to their professional websites. Tom Tomorrow, the creator of political-humor comic *This Modern World*, has "Sparky's List," an email service for fans that, for a fee, promises updates and early releases of new comics. Jen Sorensen, another politics-based comic creator, offers fans a membership in "The Sorensen Subscription Service," linked to and promoted on her website. Such creator- and strip-based websites also sell related merchandise such as book collections and posters to generate income.

As comic strips become separated from journalism as the newspaper medium declines in sales, it may mean that some of the larger profile comic strips, as a lucrative form of visual entertainment, will become further housed in larger synergistically oriented media conglomerates looking to exploit valuable character licenses or will move to digital formats that may not monetize at levels found earlier in the form's history. How these trends will affect the creation, commercialization, and fan use of comics is still to be determined.

COMMENT SECTIONS

Comment sections are online spaces where people discuss a wide variety of topics, including the news. While often hosted on the websites of news publishers, comment sections are also increasingly popular on social media platforms, for example, underneath news story links shared through the social media pages and profiles of news outlets. Comment sections are widely understood as vital venues for the health of democratic societies, as they allow people to exchange their opinions on a wide range of topics. Comment sections have also recast the relationship between journalists as the producers of news content, and their audiences, and provide agency for news readers—to interact with journalists, to provide feedback, point out mistakes in a story, and to talk to others.

As comment sections invite people to air divergent opinions, they are spaces prone to incivility or other types of problematic speech and necessitate that user debates are kept in check. Comment sections, therefore, are also important fields in which the acceptability of certain types of speech is tested and negotiated. While news outlets attempt to maintain civility in comment sections by various forms of moderation and by articulating policies of acceptable speech, moderating comments itself is a labor-intensive endeavor, and not all news outlets want to or can dedicate the necessary amount of resources to it. After a brief introduction on the history of comment sections, this entry discusses the role of comment sections from a societal-democratic, institutional, and social perspective.

Short History of Comment Sections

The history of comment sections dates to the late 1990s, with individual news outlets establishing commenting functions underneath news stories. Far from a novel idea, predecessors of comment sections were discussion boards that existed on a variety of digital services. News outlets slowly picked up on providing comment functions, hesitant at first to introduce the possibility for readers to leave their opinions directly and uninhibited in spaces formerly exclusively populated by professional journalists. Letters to the editor had been a common feature of the news well before. But unlike comments, these were editorially selected items, picked from a number of submissions. Comment sections, on the other hand, posed an agential threat to the position of power that journalists hold, as they would allow anyone to air their opinions on anything.

In the early days of comment sections, comments were policed less. Slowly but steadily, the provision of spaces for debate became the norm across news sites as well as other platforms, until around 2013, when some outlets such as *Popular Science* began to do away with their comment sections altogether. Other news outlets such as the *Chicago Sun-Times* and National Public Radio followed. News organizations that got rid of their comment sections cited a variety of reasons such as the financial impact of having to invest in teams that would keep comment sections clean, or that large swaths of readers had moved over to comment on news stories on social media platforms where the stories were shared. As

the dynamics of digital spaces changed, the majority of online debates was unfolding on social media platforms.

Three Perspectives on Comment Sections

Comment sections assume an important role in society, as they are spaces for deliberation and debate. Intricately connected to institutions that provide comment sections are the rules by which comment sections are governed—be that informally through norms of debate that are long-honed and cultural, or more concretely, through community guidelines that news outlets or social media sites have articulated. As comment sections have permeated life on the Internet, it is important to consider the people who comment online, as well as the psychology of comment sections. The remainder of this entry parses the subject area of comment sections in the domains of democracy, institutional questions, and social aspects associated with it.

Democracy and the Role of Commenting in Society

Comment sections have been hailed as spaces that allow for deliberation to unfold, a digital version of public squares that allow for people to come together and have debates about political ideas. The German philosopher Jürgen Habermas's theorizing on deliberative democracy is instrumental in thinking about online comments as a venue for the reasoned exchange of opinions that is crucial for democratic societies. As such, comment sections provide for citizens to discuss the important issues of the time, to hear countering opinions, and to not only inform themselves about the news, but also to engage with the news and participate. News outlets operating as democratic arbiters of information and as the fourth estate, in charge of keeping checks and balances on legislative, executive, and judicial branches of the government, may extend their democratic claims to not only provide information for citizens but also to provide spaces to discuss such information. Most research, however, shows that comments fail to live up to these deliberative ideals. Hosting spaces of debate is accompanied by responsibilities such as maintaining civility among commenters.

Incivility is one of the most studied and most prevalent issues that comment sections are facing.

While some commenters may argue that even their most hateful and vile statements are protected by freedom of expression principles, this may not be true, because private corporations who host comment spaces do not have to allow all types of speech. Rather, they have to navigate thresholds of acceptability. While some content might be disconcerting, it may still be important for a fruitful debate, or drive traffic toward economic goals of the platform. Other content, however, could be so disconcerting that it is assumed never to produce meaningful debate, and news outlets (and other platforms) need to take difficult decisions on how to track and get rid of such content.

Institutional Approaches to Commenting

Comment sections have fundamentally recast the relationship between journalists and news audiences. They are important as they personify a paradigm of an active audience, or participatory journalism—famously described by journalism professor Jay Rosen in a blog post as “the people formerly known as the audience.” News outlets tasked with dealing with commenters often delegate comment moderation—the oversight of reader comments, intervention, and, possibly, deletion of problematic content—to journalists themselves. As the field of comment moderation professionalized, community managers started to be put in place, charged with moderation. This was accompanied by technological solutions that would make it easier for news outlets to deal with large numbers of comments that needed to be checked for violating terms of service. Contemporary comment moderation systems typically employ combinations of technological solutions in which algorithms filter problematic content and human oversight over difficult decisions.

Different regimes of comment moderation may be put in place, some of which employ premoderation before a comment gets published, and some may constitute postmoderation. Premoderation strategies may involve manual screening and approval or disapproval of comments by human editors, or computer-assisted techniques in which algorithms predict which comments should or should not be published. Postmoderation, on the other hand, typically involves moderators getting involved once content has been flagged by users, or

otherwise brought to the attention of moderators. Moderators can swoop in after the comments are already published and weed out the ones that do not align with the rules of the platform. Because moderation is very specific to the style, scope, and size of the host of the debate, models of moderation can involve professional moderators (who may even intervene or respond to comments, instead of only deleting) or volunteer moderators. On social media platforms, moderation efforts can constitute multilayered models, in which rules of the news outlet as well as rules of the social media platform might apply to what is acceptable to post.

Social Aspects of Commenting

Comment sections are inherently social enterprises. Their success or demise depends on the people who participate in them, and the ways in which they do so. Psychologist John Suler has coined the so-called *online disinhibition effect* that posits that people are less inhibited to post and say certain things online than they are off. Indeed, content analyses commonly show that about a fifth of all comments are somewhat uncivil.

Commenter demographics are often more male and older than the general population, and it is important to consider who does and who does not participate in online comments, for a variety of reasons. People who are members of minority groups may be less prone to comment altogether if they know that there is the possibility of being harassed. Even if only a small share of all readers may comment themselves, comment sections may be interesting to others. The so-called *lurkers* are the people who do not comment themselves, but who read what others have to say. While deliberation is what academics often argue is a merit of online news comments, more tangible uses for individual users may include a sense of community and belonging that online spaces can produce. Meanwhile, comment sections can be boon and bane—they may drive traffic for news outlets, but negative content attached to the bottom of a news article can also lead to negative overall perceptions of a news outlet. Similarly, research has established that there are negative effects associated with reading certain comments, as well as exhaustion for those people who are in charge of sifting through comments. The ways in which the

Internet operates give primacy to controversial and inflammatory content. In this vein, operators of comment sections may be interested in a certain level of uncivil debate to keep the forum interesting but need to be mindful of the negative effects of how people may perceive this bleeding over on the image of the outlet itself.

COMMENTATORS, RADIO

The American radio news commentator or analyst role came into being in the late 1930s at a time of rising world tensions that would soon lead to World War II. Commentators provide their opinions about and analysis of domestic and international affairs in news segments or programs clearly identified as comment, as distinct from reportage. They are thus the aural equivalent of newspaper columnists—and of what we would term today “op-ed” contributors. While some large-market radio stations had their own commentators in the period from 1935 to 1950, the best known were network figures. Although only a few were active in radio at any given time, at their peak around 1945, several hundred commentators could be heard on the air across the country. Within a decade, however, the majority of those who remained active had moved to television. By the 1990s, radio talk show hosts had largely subsumed the commentary role. While traditional commentary had always been by definition subjective even as it attempted balanced judgment on domestic or international events, the new radio talk show formats have tended to be far more biased and politically polarized in their “commentary.”

Development

Commentary on radio is almost as old as the medium itself. In their search for programming to fill airtime, many stations welcomed those who appeared informed, could speak clearly and in an interesting fashion, to comment on current events. Indeed, commentators were heard on radio before regular news broadcasts in many cases. Newspaper attempts to quash radio newscasts in the early 1930s did not target commentary (which was not seen as competitive with newspaper columnists), thus further helping to promote on-air comment. Programs of commentary also lent themselves to commercial sponsorship much better than newscasts at that time. Commentary on radio attracted listeners who could identify with a voice and personality more readily than with mere words on a newspaper page. And commentary attracted an upper socioeconomic class audience—exactly the listeners many upscale advertisers sought. Commentators were respected and widely listened to, their views often quoted elsewhere. Most had extensive professional grounding in newspapers and magazines, and many benefited from both foreign experience and language ability, further distinguishing them from their radio talk show counterparts of today.

Commentary by its very nature usually deals with matters of controversy. Most commentators made clear that they expressed their own views, not necessarily the ideas of network or station management (and thus should not be confused with occasional broadcaster editorials that *do* speak for management). CBS and NBC developed policies by the late 1930s that appeared to promote news analysis more than commentary, while the newer Mutual (1934) and ABC (1945) networks generally allowed their speakers greater freedom of action. Numerous commentators who began on one of the legacy networks thus ended up on the newer chains. The stated aim to maintain overall objectivity and neutrality on issues—an express goal of most broadcasters who feared offending listeners or advertisers—was a constant countervailing pressure against commentary. So were shifting sponsors, for by the 1940s, advertisers controlled most radio airtime. To displease or lose a sponsor often meant losing a given time slot or even leaving the air.

Alongside the rise of television, fear of domestic communism early in the cold war helped end many radio commentator careers as radio sought to survive by airing popular music and generally avoiding controversy. A few major stations continued offering commentary, but by the 1960s, most such programs had disappeared from the air. Some commentators (such as Eric Sevareid, often heard on Walter Cronkite's evening television newscast over CBS) shifted from radio to network television. Edward P. Morgan, sponsored by the AFL-CIO labor alliance, was one of the last national radio commentators, his nightly program into the 1960s combining 7 minutes of news followed by as much commentary (presented as "the shape of one man's opinion"). Documentaries—often with a point of view—fled to television, only to disappear in their turn to such cable networks as the Discovery or History channels.

Some Noted American Radio Commentators

Hilmar Baukhage (1889–1976)

Baukhage used only his last name on the air, beginning his commentaries simply as "Baukhage Talking." Of German background, he studied there and in France, becoming fluent in both languages as well as English. He worked for a number of newspapers, the Associated Press, and some magazines before being heard on the NBC-Blue network starting in 1932. As World War II began, he broadcast first from Berlin, then from Washington. He continued with a 15-minute daily commentary when NBC-Blue became ABC in 1945, sometimes covering one topic per broadcast, sometimes several. While most concerned with news events, Baukhage would sometimes comment on lighter aspects of life. He began offering commentary on the Mutual network in 1948, moving to a spot with it full time in 1951. He retired 2 years later, after the network declined to renew his contract, arguing he was paid too much and spoke too long for modern listeners.

Harold Thomas "Boake" Carter (1903–1944)

Carter was born in Russia, and he grew up in England, arriving in the United States in the early

1920s. He worked for Philadelphia newspapers and was first heard on radio in that city when he broadcast a rugby match in 1930. His early attempts at radio commentary failed (listeners claimed they could not understand his English accent, which he soon modified to sound more American), but he was soon heard on a Philadelphia radio station offering news and brief commentary. His reporting of the Lindbergh baby kidnapping in 1932 propelled him to the CBS network. For 5 years, Carter was a highly popular figure on CBS, offering both news and commentary; however, the tone of his broadcasts became sharper and more right wing (and isolationist), and the network terminated him in mid-1938 when his sponsor contract ended. Carter broadcast twice a week over the Mutual network until his death.

Upton Close (1894–1960)

Close was born Joseph Washington Hall but gained his press and radio name from his early articles from and about China (he was a fluent Chinese speaker), which ended with the words “up close.” He became a right-wing radio commentator who began his career with liberal views. Close authored seven books and a host of articles about Asia. After a period as a lecturer in the early 1920s, he first broadcast in 1924. He provided occasional broadcasts over NBC from 1934 to 1941, often speaking on Asian affairs. These appearances became weekly by the fall of 1942—and increasingly right wing in tone, compared to his incisive and balanced Asian reporting. When his commentaries became increasingly focused on perceived conspiracies, NBC removed him from the air in December 1944. He broadcast briefly (1945–1946) over the Mutual network and then retired to Mexico.

Elmer Davis (1890–1958)

Davis is perhaps best remembered today for heading the Office of War Information during World War II. A Rhodes Scholar (1910), he became a *New York Times* reporter in 1914, and wrote novels and short stories as well. Failing to get the foreign correspondent berth he sought,

Davis served as an editorial page writer and editor until leaving the *Times* in 1924 and turning to freelance writing. His liberal views became clearer as war approached, and he began commentary over CBS radio in September 1939, just after war broke out in Europe. His reasoned, conversational delivery quickly gained him a loyal audience, and his audience ratings were behind only those of commentator H. V. Kaltenborn and newscaster Lowell Thomas. He employed calm, unemotional words with a dry wit. Early in 1942, after a period of months broadcasting from England, Davis was tapped to head Office of War Information. After the war, in 1945, he shifted to the new ABC network and broadcast news and analysis three evenings a week, alternating with Raymond Swing until 1947, when Davis took over the whole schedule. He retired in 1953, doing occasional television commentary.

H. V. Kaltenborn (1878–1965)

Kaltenborn began his journalism career in newspapers, rising to become editor of the *Brooklyn Eagle* in the 1920s. He may have been the first radio commentator when he appeared over a New York station in 1922 and remained the dean of the field for three decades. His clipped Germanic delivery style and his ability to speak without notes—and to translate from several languages—made him widely recognized and respected. He began reporting stories while serving as an American volunteer during the Spanish-American war. Serving as a reporter for the *Brooklyn Eagle*, he rose to become associate editor. He had a regular program on radio by the mid-1920s and left the *Eagle* for full-time radio work in 1930. Kaltenborn’s supreme moment came with the September 1938 Munich crisis, where he stayed at his CBS studio in New York for a month, catching sleep in a nearby room so he could go on the air anytime an important event or speech needed translation and analysis—all of which he did extemporaneously. He shifted to NBC a year or so later and often broadcast from distant battlefronts. He stopped regular broadcasting in 1953 out of disgust over how television was reducing broadcast journalism by diminishing the spoken word.

Fulton Lewis Jr. (1903–1966)

Lewis grew up in and began his newspaper reporting from Washington, DC. He served for nearly a decade as the Washington bureau chief for the Hearst-owned International News Service. He became especially known for exposing scandal in the nation's capital beginning with the awarding of airmail contracts in the early 1930s that led to a Senate investigation and substantial change in the air transport business. At the same time, Lewis began his broadcasting career with Washington station appearances as one of many newspaper reporters. By 1936, he was featured on the new Mutual network in *The Top of the News* with a host of local sponsors, thus reducing his dependence on any one firm. Lewis's broadcast views were conservative, generally paralleling those of the Republican Party. In 1939, by then one of the country's most popular radio commentators, Lewis led the effort to secure for radio journalists equal seating rights in Congress and the White House as their colleagues in the press. Because of his efforts, what had been *press* conferences became *news* conferences. He backed isolationists before the Japanese attack on Pearl Harbor and continued with highly critical commentary on government and military decisions during the war. He remained on the air, ever more conservative, into the 1960s, though with declining audiences.

Edward R. Murrow (1908–1965)

Murrow became the most popular radio commentator during and after World War II. Building on his reputation gained from insightful reporting from Europe during the war, he broadcast *Edward R. Murrow with the News* nightly at 7:45 p.m. on the CBS radio network from 1947 to 1959. It was the 15-minute radio showcase for CBS News that concluded with a few moments of Murrow's commentary, called *tailpiece*, on people and events in the news. His reassuring voice, combined with his by then extensive experience, made him a widely trusted figure in the 1950s, though also often a target for right-wing attacks on his perceived liberal viewpoint. Because he was using radio, then seen as a media backwater, he had more freedom of commentary than was allowed on his television documentaries.

Dorothy Thompson (1894–1961)

Thompson was a rarity—a woman in the largely male world of radio journalism. An early feminist and speaker for women's suffrage, Thompson became a foreign correspondent (one of the earliest women in that role, too) in Europe for newspapers and news agencies and then wrote popular columns for, among other publications, the New York *Herald Tribune* and *The Ladies Home Journal*. Her appeal was substantial, as was her audience. She began her radio work in 1936, 2 years after being expelled from Hitler's Germany, where NBC had sent her to report on the political conventions there. She began a weekly 15-minute radio commentary program a year later, first on NBC and then at Mutual, which lasted until early 1945. She continued writing until the late 1950s. Thompson generally took a strongly internationalist tone on world affairs and an independent approach to domestic issues.

Conclusion

Radio by the 1970s and 1980s no longer had time for or interest in commentary. In an era of "rip-and-read" 5-minute newscasts and sound-bite journalism, sustained, thoughtful analysis simply did not fit. The few remaining news commentators—such as the syndicated Paul Harvey or even Charles Osgood on CBS—began reading commercials for their sponsors, something almost no commentator in the medium's golden years had ever done. At the beginning of the 21st century, only on public radio did commentary survive in the United States. Daniel Schorr, for example, after years at CBS, joined National Public Radio in 1985 and commented on domestic and international affairs for more than two decades.

By the turn of the 21st century, there was virtually no commentary left on broadcast radio, and precious little on television. Instead, listeners were inundated with talk show hosts, most of them conservative in their views, who aggressively presented opinion rather than analytic commentary on local, national, or world affairs. Journalistic commentary had given way to better paying political and social verbal face-offs.

COMMISSION ON FREEDOM OF THE PRESS

The Commission on Freedom of the Press, also known as the *Hutchins Commission*, was established in 1943 to study U.S. press freedom. It produced a landmark work in journalism studies, the book *A Free and Responsible Press* (1947). *A Free and Responsible Press*, the product of a unique collaboration of American public intellectuals, presents a sophisticated analysis of the news media in a democracy, one that transcends its times. This entry first discusses the origins and operations of the commission. It then looks at the commission's findings and the impact of *A Free and Responsible Press*.

Origins and Operations

In the early 1940s, Time Inc. editor-in-chief Henry R. Luce broached an idea to his friend Robert Maynard Hutchins, president (later chancellor) of the University of Chicago. Noting that the university conducted corporate-funded scientific research, Luce suggested a Time Inc.-funded philosophical

study of freedom of the press. Hutchins at first dismissed the notion as impracticable, but after several conversations, he agreed to organize the study. He and Luce recruited a dozen eminent American thinkers—including theologian Reinhold Niebuhr, poet and Librarian of Congress Archibald MacLeish, First Amendment scholar Zechariah Chafee Jr., philosopher William Ernest Hocking, and communications theorist Harold D. Lasswell—plus four foreign advisers. When Judge Learned Hand declined to chair the project, Hutchins took on the role himself, as the 13th member.

The Hutchins Commission, as it came to be called, met 17 times between 1943 and 1946, funded by \$200,000 from Time Inc. and \$15,000 from Encyclopaedia Britannica, and supported by a four-person research staff. (The commission members and the foreign advisers all were white males, as were three of the staff researchers; the fourth researcher was a white woman.) In March 1947, the University of Chicago Press published its general report, *A Free and Responsible Press*, which was signed by all 13 members. The commission also sponsored five supplemental volumes written by members and researchers.

A Free and Responsible Press

Although *A Free and Responsible Press* discusses a wide range of topics—information and entertainment in newspapers, books, movies, radio, and magazines, plus political discourse among citizens—it focuses principally on news of public affairs in newspapers and newsmagazines. The commission reaches four broad conclusions: (1) the current performance of the press is poor; (2) as a philosophical matter, a democratic government can legitimately regulate the press; (3) regulations are not warranted under current circumstances; (4) instead, solutions must come from outside the government.

Press Performance

The Hutchins Commission's assessment of press performance is best remembered for its list of the functions of a media system in a democracy:

Today our society needs, first, a truthful, comprehensive, and intelligent account of the day's

events in a context which gives them meaning; second, a forum for the exchange of comment and criticism; third, a means of projecting the opinions and attitudes of the groups in the society to one another; fourth, a method of presenting and clarifying the goals and values of the society; and, fifth, a way of reaching every member of the society by the currents of information, thought, and feeling which the press supplies (Commission on Freedom of the Press, 1947, pp. 20–21).

Of the five criteria, the report concentrates principally on the first (truthful coverage) and the second and third (diverse voices). It asserts that significant elements in the American media are performing so poorly that they threaten “the preservation of democracy and perhaps of civilization” (Commission on Freedom of the Press, 1947, p. 106) though it presents little evidence.

Role of the State

The report rejects the view that freedom of expression by definition confers a near-absolute right to speak on citizens while imposing a near-absolute prohibition against government action. It develops three interrelated arguments.

First, free expression serves listeners as well as speakers; accordingly, conflicts over expression must be analyzed in terms of the interests of both groups. It follows that the state on occasion can regulate speakers, including the news media, in order to advance the interests of listeners.

Second, free expression merits protection because it advances certain social values, and those values demarcate the scope of the freedom. Under this instrumentalist approach, if speech is free for the purpose of fostering liberal democracy, then speech need not be free when it fails to foster liberal democracy. The commission characterizes this approach as *freedom for* (fostering liberal democracy) as opposed to *freedom from* (the state).

Third, although journalists typically view free speech as a negative right, meaning that government action abridges the freedom, free speech is also a positive right, meaning that the government can aid those who want to exercise the freedom. Under a positive conception, for example, the state might require media organizations to

provide column inches or airtime to certain groups, so that they could promulgate their messages to large audiences; by contrast, a negative conception would bar such requirements.

With these three arguments, the commission lays a philosophical foundation for regulating the press. The classic counterargument is that political leaders cannot be trusted with such regulatory power because their tenure in office may depend on news coverage. The commission acknowledges this counterargument but implicitly rejects it.

Governmental Remedies

According to the Hutchins Commission, American media owners have too much power and too little responsibility. The power stems from monopoly and concentrated ownership; the irresponsibility manifests in (among other things) the owners’ refusal to provide a platform for diverse ideas and their occasional use of falsehoods to promote their own ideas. *A Free and Responsible Press* generally rejects antitrust enforcement as a tool for reducing concentrations of ownership and power. To enhance the diversity of voices in the press, the report advocates a common carrier approach. (Under the law, a common carrier, such as a telephone company, must transmit all messages at standard rates; it cannot discriminate.) The report recommends the common carrier approach only as a model, and not as a legal requirement. It also concludes that new laws are not appropriate to punish falsehoods in the press.

Thus, although the commission argues that regulation of the press is justified on a philosophical level, it rejects most regulations on pragmatic grounds, given the exigencies of the moment. But it stresses that if the press fails to improve, new regulations are inevitable, and they may be draconian. The First Amendment will provide no protection, for “[t]he amendment will be amended” (Commission on Freedom of the Press, 1947, p. 80).

The report does urge the government to improve the system of free expression through various non-punitive means, including extending First Amendment protection to broadcasting and film; repealing laws against seditious speech; spurring government agencies to inform the public about their decisions and policies, through state-run media if necessary; aiding start-up media

organizations through tax laws or postal rates; and enabling news organizations to avoid some libel suits by publishing corrections or responses.

Nongovernmental Remedies

A Free and Responsible Press discusses nongovernmental oversight of the press in terms of internal and external mechanisms. It considers three internal mechanisms, operating within the media. First, the report rejects ethics codes and other forms of self-regulation as toothless. Second, it advocates the concept of professionalism, which holds that profit is not the sole measure of success, while acknowledging that journalism does not precisely fit the model of a true profession. Third, it urges media organizations to engage in vigorous mutual criticism.

The report also considers three types of external nongovernmental oversight. First, it rejects citizen activism, including boycotts, on the ground that pressure groups are inherently self-serving. Second, it calls on journalism schools to adopt a more critical stance toward the industry, on the model of law schools, while calling on universities to establish centers for academic study of the media. Finally, the report recommends a new form of nongovernmental oversight, a nonprofit civic organization that will periodically report on the performance of the press—in essence, a press council. The press council is the commission's principal recommendation.

Beyond oversight, the report advances additional proposals for nongovernmental actors to improve the system of free expression. For the media, it recommends shifting control of broadcast programming from sponsors (and their advertising agencies) to broadcast licensees; producing high-culture content, even if it loses money at first; and raising the competence of journalists through better education (particularly in the liberal arts), higher pay, and longer term contracts. It also recommends the creation of nonprofit media organizations at universities and elsewhere.

Impact

Contemporary Reactions

Reactions to *A Free and Responsible Press* varied. Generally speaking, establishment and liberal

publications and columnists praised it, as did *Quill* and the new *Nieman Reports*. Conservative publications and columnists denounced it, as did *Editor & Publisher* and leaders of two industry organizations, the American Newspaper Publishers Association and the American Society of Newspaper Editors. Luce found *A Free and Responsible Press* to be a disappointment. Responsibility to a free society, in his view, is meaningless. He believed that journalists (and everyone else) ought to consider themselves responsible to God.

Demise and Revival

After the initial wave of coverage and reviews, the Hutchins Commission and its report virtually disappeared. They began to be resurrected in 1956, thanks to the publication of *Four Theories of the Press*, by Fred S. Siebert, Theodore Peterson, and Wilbur Schramm. Peterson's chapter on social responsibility relies heavily on *A Free and Responsible Press* plus one of the commission's supplemental volumes, Hocking's *Freedom of the Press: A Framework of Principle*. Peterson concludes that libertarian press theory is outmoded; social responsibility is the theory of the future.

Four Theories entered the curriculum of schools of journalism, and it helped bring *A Free and Responsible Press* to the attention of students and scholars. Today, the Hutchins Commission is the subject of several books and monographs as well as scores of articles, chapters, and dissertations. Its list of the functions of the news media appears in many textbooks. Beyond journalism studies, the Supreme Court cited *A Free and Responsible Press* and applied its analysis in a pivotal case about media access, *Miami Herald Publishing Co. v. Tornillo* (1974).

COMMUNITY RADIO

The term “community radio” means different things in different contexts, but in general applies to small-scale terrestrial radio broadcasting featuring content created by and for distinct communities. Community radio is generally considered distinct from “commercial radio” and “public radio,” and its purpose is to provide a third tier of radio broadcasting that emphasizes public service programming and/or public access to radio airwaves. This entry further defines community radio and then discusses its origins and its manifestations throughout the world.

Community radio has existed in some form almost as long as radio itself, and the sector increased in scope and focus through much of the late 20th century. Since the turn of the 21st century, community radio has been enabled through widespread regulatory and licensing schemes, although the growth of the sector has been hampered at times by hostile legislation, opposition from commercial interests, and insufficient financial and volunteer support.

Not to be conflated with “local radio,” community radio is more than just radio serving a distinct geographic region; community radio emphasizes community-specific content produced by (or with heavy involvement from) the community itself. Distinctions between community radio and local/niche radio often are determined by organizational and funding models rather than matters of coverage areas and/or programming. Quite often (but not exclusively), community radio operates on a nonprofit, volunteer-staff model, with most, if not all, funding from local donations and sponsorships, governmental programs, and grants from nongovernmental organizations (NGOs) and philanthropies.

Although both commercial and public radio stations can (and some, in fact, do) provide community-specific news and programming, those sectors generally rely on paid professionals to develop content and to manage the stations. In turn, some community radio stations may augment their local programming with syndicated content that can also be found on commercial and/or public stations (e.g., BBC World Service is broadcast via a number of community radio stations in Africa and Asia, and low-power FM community radio stations in the United States often carry syndicated programs from public radio networks).

Legal definitions, used for regulatory purposes, also vary for “community radio” in different parts of the world, though an increase in distinct regulation has occurred in the early 21st century. Some small-scale commercial stations emphasize local content and encourage public participation and thus provide programming that, to the audience, may be indistinguishable from legally defined community radio stations. Outside the law, unregistered “pirate radio” initiatives also can fill the same cultural roles as licensed community radio, particularly in authoritarian and/or underdeveloped regions where anti-government content is restricted. Similar community-focused content may be produced by local stations of national networks (such as local ABC stations in Australia and local NPR affiliates in the United States), public service and educational radio based at universities, and church-based “hyperlocal” radio broadcasts. The term “community radio” also has been applied to Internet-based audio streams serving dispersed cultural groups, even if there is no

terrestrial broadcasting component to such outlets. Given all of the variables and culturally relative applications of the term, it is more useful to consider “community radio” as a big-tent concept embracing a number of different models, with the one common variable being an emphasis on community engagement via community-focused programming.

Origins of Modern Community Radio

In many ways, the earliest use of radio in the early 20th century was a *de facto* form of community radio, fueled by radio hobbyists and collective “radio clubs” (such as those in the United States and Canada before World War I) and rebel organizations in Ireland, Germany, and other parts of Europe, as well as the Egyptian capital, Cairo. The onset of governmental licensing and regulation from the 1920s onward created a legal limbo for community radio, and in some nations led to a decline in community radio as commercial radio and, later, public radio expanded. From the 1960s onward, efforts were made worldwide to create regulatory environments that would allow for legal nonprofit community radio; by 2020, dozens of nations had enacted laws specifically aimed at allowing and supporting community radio.

Latin America is considered the birthplace of community radio, and the platform continues in the 21st century to serve a number of disparate communities in both urban and rural regions. An early example was Radio Sutatenza, launched in 1947 by a Catholic priest hoping to combat illiteracy in rural communities of Colombia; the local effort eventually expanded to provide a variety of educational programming across a national network. In Bolivia, mine-workers’ unions began operating radio stations as early as the 1940s using relatively inexpensive equipment with only local or regional range. The various Radio Mineras stations provided Bolivian communities with more than news and cultural programming—they also became conduits for public announcements, personal messages, birth announcements, obituaries, and anti-corruption commentary during periods of authoritarian censorship of newspapers and commercial broadcasters (during which some miners’ radio stations also were targeted for closure by government forces).

Clandestine radio broadcasting was common in the geopolitical shifts that followed World War II, with examples such as Voice of the Revolution in the Dominican Republic, Radio Rebelde in Cuba, Palestinian and Zionist radio in Israel, anti- and pro-communist radio in Eastern Europe, and Basque radio in northern Spain. The term “pirate radio” originated in the 1960s and 1970s, with Denmark’s Radio Mercur broadcasting from a ship in international waters to evade mainland licensure and regulators. The programming of many of those European pirate radio stations was mostly popular and/or minority-culture music that was not carried by government broadcasters, and the business models were mostly commercial, for-profit enterprises. The movement inspired a proliferation of unlicensed stations serving minority immigrant groups in and near major cities. A few, however, had more political bents in the traditions of clandestine radio, such as Radio Free Scotland (advocating for Scottish independence), Radio Enoch (promoting conservative politics), Our Radio in London (promoting anarchism and left-wing politics), and numerous pirate stations serving various Black communities in the United Kingdom. Late in the 20th century, community radio (mainly unlicensed) had flourished in Ireland, Spain, France, and other countries as well, although regulatory crackdowns in the 1980s and 1990s began to curtail the activity.

Community radio also has its roots in the mid-to-late 20th century expansion of the “campus radio” (also known as *college radio*) sector, which evolved concurrently with commercial radio starting in the 1920s. Through the middle of the 20th century, campus radio was used for experimentation and training, and public broadcasts often included local news, weather reports, public announcements, educational programming, and, occasionally, live coverage of campus events such as sporting contests or public lectures. Because of financial constraints and regulatory limitations, most early campus radio efforts were low-budget operations staffed by volunteers, mostly students, and programming decisions often emphasized locally produced content of local or regional interest (quite often reflecting the ideological and aesthetic preferences of the students who volunteered at the stations). The civil rights and counterculture movements of the 1950s and 1960s, both of

which saw strong support on college campuses, influenced programming decisions at many student-run campus stations as well.

In the United States, KPFA started broadcasting to the San Francisco Bay region from Berkeley in 1949, launching the listener-funded model of radio later adopted by the public broadcasting model. As many college stations switched to the public-broadcasting model, the 1960s–1970s saw the early stages of regulatory changes (primarily in stable democracies) to accommodate nonprofit, community-focused radio. That period also saw an increase in associations devoted to bringing together community broadcasters for mutual support and professional development.

The end of the 20th century set the tone for the contemporary community radio environment. South Africa's Bush Radio, now considered a model for community radio, started as an anti-apartheid "broadcaster" that distributed audio programming by cassette tape and (briefly) via illegal broadcasts in the months leading up to the 1994 election and the end of apartheid, after which Bush Radio was officially licensed to operate in Cape Town. A few years later in Serbia, Radio B92 in Belgrade courted censorship by providing an anti-war, pro-feminist message to counter the authoritarian opportunism of the regime of President Slobodan Milošević. Off the coast of Israel, The Voice of Peace broadcast pro-peace programming from 1973 until 1993, when the ship was intentionally scuttled to recognize the signing of the Oslo Peace Accords; in 1988, Voice of Peace was countered by another offshore broadcast, Arutz Sheva, which opposed peace negotiations between Israel and the Palestinian Liberation Organization. Other examples of politically motivated pirate radio can be found around the world, some of them clandestinely backed by governmental intelligence agencies, but many of them existing as truly grassroots endeavors.

From the 1990s onward, community radio also was leveraged as a tool for economic expansion and social progress in developing countries and regions, as well as for nation-building in postcolonial nations in Africa and Asia. Often funded by NGO grants and/or government funding schemes, nonprofit community radio has been viewed as a conduit for free expression, a means to showcase cultural diversity, and a conduit for educational programming (particularly in regard to personal

health and conflict resolution). Especially in underdeveloped regions of Africa, Asia, and Latin America, community radio projects have focused on promoting the rights of women and children, encouraging education and community engagement, celebrating (and documenting) local culture, and sharing views and opinions that are largely absent from existing commercial and public broadcasting.

Community Radio in the 21st Century

Despite the promise of community radio, and initial support of that "third tier" of broadcasting via regulatory frameworks and startup funds, the reality is that community radio projects often struggle to survive in terms of both operating revenue and sustainable volunteerism. Political shifts also play a role, as changes in regulatory and enforcement priorities may support community radio during one regime, but the next regime may undercut community radio for commercial and/or partisan reasons.

Global and regional bodies have generally been supportive of the expansion and support of community radio. In 2001, the African Charter on Broadcasting, adopted by participants in a United Nations Educational, Scientific and Cultural Organization (UNESCO) conference held in May of that year in Windhoek, Namibia, called for international recognition of community radio as distinct from public broadcasting, claiming the former is "broadcasting which is for, by and about the community . . . which pursues a social development agenda, and which is non-profit" (Media Institute of Southern Africa, 2001). In 2007, a Council of Europe declaration regarding media pluralism recognized "community media" (including radio) as having

Independence from government, commercial and religious institutions and political parties; a not-for-profit nature; voluntary participation of members of civil society ...; activities aiming at social gain and community benefit; ownership by and accountability to the communities . . . and commitment to inclusive and intercultural practices. (UNESCO, 2019)

UNESCO in 2008 called for worldwide measures to “improve conditions for the development of community media,” and again in 2012 called for countries to support “all three tiers of broadcasters—public service, community and commercial.” Founded in 1983, the Association Mondiale Des Radiodiffuseurs Communautaires (AMARC, World Association of Community Radio Broadcasters) has been especially active in the 21st century. In 2003, AMARC issued its “Kathmandu Declaration” noting that community broadcasting was “the most affordable, egalitarian, and accessible communication technology” (Schuler, n.d.) to counter militarism, religious fundamentalism, and other threats to human rights; at its 2010 conference in Bangalore, AMARC committed to expanding community radio among indigenous peoples of the world; and from 2014 to 2015, AMARC teamed up with the Food and Agriculture Organization of the United Nations to support community radio in farming communities.

Calls by intergovernmental bodies for expansion and support may have led to action by national governments, but in practice, the expansion of community radio has been a slow process with mixed results.

In Africa, where many nations gained independence and shifted to democratic governments since the 1990s, the regulatory and financial frameworks for community radio have had varying levels of efficacy. Community radio saw expansion in some African countries, most notably Benin, Mali, Mozambique, and South Africa, but has languished in others—most notably Nigeria, Africa’s most populous nation, where regulatory hurdles and high licensing fees have hampered the expansion of community radio.

Formal community radio remains relatively undeveloped across Asia, though there have been some success stories. Hundreds of community radio stations in Indonesia (many unlicensed) provided crucial information after the 2004 tsunami disaster. The small cadre of community radio stations in coastal Bangladesh, using local dialects, provide an early-warning system against tsunamis, flooding, and cyclones. Nepal’s scores of community radio stations in 2005 circumvented an order from King Gyanendra prohibiting anything but music on the airwaves by singing the news in more than 20 languages. Community radio has a long

tradition in the Philippines, though the term is often applied to commercial local radio outside of greater Manila; nonprofit, development-oriented radio there struggles under a cloud of militaristic authoritarianism (including a “culture of impunity” toward violence against journalists) and resistance from commercial radio. India’s community radio environment has seen slow growth but has been important in preserving local dialects and minority music and folklore traditions while also advocating for women’s and children’s rights.

The long-standing role of community radio throughout Latin America has seen both support and contraction as nations modernize regulatory frameworks, with media-friendly governments offering regulatory support and more authoritarian regimes enforcing censorship from government and hostility from commercial media that feel threatened by competition from nonprofit radio. In Uruguay, decades of legal limbo—by which community radio was neither regulated nor specifically outlawed—ended with the 2007 Community Broadcasting Law, after which scores of radio stations were disbanded for running afoul of content prohibitions (focused on religious and political activism), while scores of new stations were licensed in urban and rural neighborhoods. Ecuador’s community radio sector languished for decades but saw some improvement in 2010 when 14 licenses were issued to indigenous groups along with government start-up and training programs. Colombia’s hundreds of community radio stations enjoyed some governmental support, but organized crime has made Colombia one of the most dangerous countries for journalists in the world.

Community radio in Europe has flourished in the mature democracies of the north and west but has languished in the younger democracies of the central and eastern nations as of 2020. Denmark, France, and Sweden have robust community radio sectors, but the sector is nascent and underdeveloped in the United Kingdom, Poland, Serbia, and Germany. Community radio has especially struggled under an increasingly authoritarian government in Hungary since 2011. Elsewhere, favorable regulatory environments in Australia, Canada, and the United States led to an expansion of community radio early in the 21st century, but many remained low-budget operations associated with

college campuses, churches, and niche urban communities. The United States especially underwent an expansion of low-power FM licensure from 2000 through 2013, but no new licenses had been issued through 2020.

Around the world, the promise of community radio remains precarious due to hostile legislation, authoritarian regimes, unfavorable regulatory environments, financial hurdles, and insufficient volunteerism. Yet those challenges are overcome by thousands of long-functioning community radio stations that leverage grassroots popularity, “make-do” determinism, and, of course, enduring support from the communities they serve.

COMPARATIVE MODELS OF JOURNALISM

There is a long tradition in journalism studies scholarship of comparing the ways in which journalism is practiced in different contemporary societies. Such work usually combines elements of ideology or norms with consideration of legal or political traditions and economic arrangements. In the 20th century, comparative studies were deeply influenced by modernization narratives and Cold War politics. In recent years, studies of national systems replaced more normatively inflected studies and have in turn begun to be displaced by considerations of global systems and infrastructures. At the same time, new models of journalism have flourished in the new technological ecosystem, complicating comparative frameworks. This entry discusses the development of comparative models of journalism, including the influential *Four Theories of the Press* and subsequent models that grew out of critiques of the *Four Theories* approach.

Work in comparative models in the English-speaking world emerged from studies of the history of freedom of the press. Drawing on journalism's craft memory, scholars constructed a Whiggish narrative of the rise of a free professional press that combined the intellectual history of liberalism with an evolutionary model of the history of the news business from partisan attachment to market-based independence. This approach also took note of the steady increase in the size and penetration of the news media system in developed countries, suggesting a connection between quantitative increase and liberalization and encouraging measurements of numbers of newspapers per capita or of broadcast stations to accompany assessments of increasing freedom of expression. To the scholars of this generation, the non-English-speaking world constituted a less-evolved hinterland in need of evangelization and conversion.

This framework of Whiggish development led to a series of attempts to compare or rank media systems according to either the single dimension of legal freedom from restraint or the growth of quantitative indicators of media activity. The first approach was exemplified by the annual report *The Balance Sheet of Freedom*, begun in 1955 by the U.S. nongovernmental organization Freedom House, which continues to publish a series of successor annual reports ranking or classifying countries on various aspects of liberal governance. The second approach typified the development-oriented work of international organizations such as United Nations Educational, Scientific, and Cultural Organization (UNESCO), which began classifying countries according to quantitative indicators in the 1950s. These two approaches complemented each other, as both assumed an unproblematic link between norms that promoted freedom of the press and the sort of economic development toward societies of “high mass consumption” that fostered the growth of media systems.

An enduring crystallization of this line of thought was the 1956 short book *Four Theories of the Press*, coauthored by Fred S. Siebert, Theodore Peterson, and Wilbur Schramm. *Four Theories* identified four ideal types of media systems—the authoritarian, the libertarian, the social responsibility, and the Soviet communist—structured according to philosophical principles about basic matters: the nature of “man,” the nature of the state or society, and the nature of knowledge or truth. The authoritarian theory held that “man” is inherently selfish and dependent on a strong state for the maintenance of order and that knowledge is difficult and truth either unitary or opportunistic; while the libertarian theory held that “man” is guided by reason and is capable of independently discerning truth, so that only a minimal state to protect natural rights is required. The social responsibility theory is a modification of the Libertarian Theory to fit industrial society; the Soviet communist theory does the same for the Authoritarian Theory.

Four Theories was quickly thrown together out of its authors’ other work. The first two chapters drew on Siebert’s book on freedom of the press in England, Peterson based the social responsibility theory on his research on the Hutchins Commission,

and Schramm’s chapter on Soviet communism came out of his long involvement in work for the U.S. government, from World War II’s Office of War Information to psychological warfare and U.S. Information Agency media development work with Daniel Lerner and others.

Despite its casual composition, the book had enduring influence in journalism education. Its impact was a result of its simplicity and its normative clarity. These characteristics made it an effective teaching instrument; translated into many languages, it came to occupy a space in the curriculum of journalism schools around the world and was frequently summarized in more general media studies texts. Its normative influence and sweeping historical generalizations also made it a target of scholarly criticism. Some scholars critiqued its philosophical assumptions, arguing that *Four Theories* had constructed a supposedly neutral schema of normative theories by using the basic categories of one of the traditions it characterized, thereby smuggling in a covert point of view. Others pointed to historical inaccuracies that led to a flattening of the distinctions between strange bedfellows like Plato, the Pope, and Adolf Hitler.

These criticisms dented but did not wreck the appeal of *Four Theories*. Its longevity owed much to its harmony with ideological currents in the postwar liberal world order. In fact, it experienced a revival with the collapse of the Soviet bloc and the rise of market-based media in the former Soviet republics.

Critiques of *Four Theories* and Western Liberal Approaches

Criticisms of *Four Theories* come from several angles. Some focus on what the book included and note weaknesses in its historical accounts and philosophical framework. These are usefully summarized in the book *Last Rights*, written by a group of scholars at the University of Illinois, which gathers critiques aimed at each of the theories of *Four Theories* while at the same time questioning the overarching architecture of the book.

Other critiques point to the need for a broader spectrum and therefore propose more theories. Much of this work recognized that the authors of *Four Theories* did not claim that there were only

four theories and was inspired by a realization that the four theories that had been chosen had come from the particular histories of a few countries. With the movements for national liberation that followed World War II, a whole generation of new countries offered different theories of the press. So some scholars proposed, for example, adding “development journalism” as a fifth theory.

Other critiques called for a more nuanced or reflexive philosophical approach. Some noted that the confident liberalism shared by the authors of *Four Theories* seemed out of tune with the postmodern moment; these required comparisons to reckon with the viewpoint from which they were written. Others embraced a reconstructed liberalism based on pragmatics and the sort of public sphere theory that became associated with Jürgen Habermas. Studies comparing the public spheres or political cultures of pairs of countries became common in the 1990s. One work that tried to encompass this angle of attack and offer a more nuanced historical and philosophical exploration of the roles and values in media systems was the 2009 book *Normative Theories of the Media*, written collaboratively by an international group of communication scholars.

A broader kind of critique called attention to the global order within which any nation’s media system was nestled. This sort of criticism drew on a recognition that any media system would embody the power structure of the society it inhabited, a point of view emphasized by J. Herbert Altschull’s influential 1984 book *Agents of Power*. Such criticism found support in the emergence of movements from the global South. Scholars working with the concept of dependency, for example, challenged the modernization paradigm that scholars like Lerner and Schramm proposed. Noting that the path to modernization for Western liberal societies had been built out of the subjugation of the East and South, they pointed to patterns of “cultural imperialism” that mirrored military and economic imperialism. Such scholarship called for new categories of comparison to capture non-Western ways of assembling media systems.

One exemplar of this line of thought was the movement for a New World Information and Communication Order (NWICO) that occupied

UNESCO in the 1970s and 1980s. The NWICO debate climaxed with the report of the MacBride Commission, first presented in 1978 and published as *Many Voices, One World*, in 1980. The report summarized criticisms of the uneven flow of news, culture, and information in the world, echoing arguments from dependency theorists and foreshadowing the rise of postcolonial studies and subaltern studies. It was met with a furious attack from the United States under President Ronald Reagan and the United Kingdom under Prime Minister Margaret Thatcher, both of which withdrew from UNESCO in protest: a key moment in the emergence of a neoliberal world order.

Comparing Media Systems

By the turn of the century, critiques of Western liberalism, geopolitical developments, and growing recognition of the postmodern condition combined to produce greater humility among scholars of comparative studies of every sort. It was recognized that universal maps of comparative systems would have to be tentative and self-reflexive. It was also felt that empirical categories should be cleansed of the normativity that approaches like *Four Theories* had exhibited.

The exemplar of this moment of comparative studies was *Comparing Media Systems*, by Daniel Hallin and Paolo Mancini. Hallin and Mancini limited their scope to a coherent historical sphere—Western Europe and North America in the modern era—and conscientiously surveyed scholarship in the history, politics, and sociology of the media structures in various nations. Out of this material, they induced three basic ideal types or models of media systems: the liberal North Atlantic model, the democratic corporatist Northern European model, and the polarized pluralist Southern European model. They noted that every country’s system includes diverse elements and that these models are constructs, but they also noted a historical tendency across almost all of the national systems to converge toward the liberal model. Aware of the defects of the *Four Theories* approach, they clearly limited their observations to the West and explicitly demurred from normative pronouncements for non-Western media.

Comparing Media Systems has had wide impact. Among other reasons, it bases its models

on “dimensions” that are often measurable, allowing quantitative comparisons across nations. This factor has been especially important in Europe, where grant money has enabled a generation of follow-on studies.

Hallin and Mancini have been criticized for not exploring beyond Western media systems. Typical of this critique is the collection *Comparing Media Systems Beyond the Western World*, edited by Hallin and Mancini themselves. Partly consisting of country studies and partly of more abstract or methodological contributions, the collection demonstrates the usefulness of Hallin and Mancini’s approach for theory building while at the same time pointing to realities that are harder to encompass, particularly the increasingly important case of China and the rising salience of regional and global media, such as Al Jazeera in the Arab world.

A similar approach to comparative study is exemplified by the Worlds of Journalism Study. A collaborative effort spearheaded by Thomas Hanitzsch at LMU Munich and Folker Hanusch at the University of Vienna, Worlds of Journalism compiles survey data contributed by affiliates in countries around the world. Its aim is to provide resources for comparative studies of the discursive construction of journalism at both the organizational level and the societal level. In contrast to Hallin and Mancini, Worlds of Journalism incorporates the perspective of working journalists, capturing their perceptions of journalism’s roles, values, and constraints.

Globalization

There are limits to country-by-country approaches. Critics of the global media system had long made the point that national media systems were dependent on global infrastructures. One of the targets of critics in the NWICO movement was the dominance of Western news services such as Reuters and the Associated Press. Other global factors included the distribution of spectrum through the International Telecommunications Union; the recognition of intellectual property rights through the Berne Agreement, the General Agreement on Trade and Tariffs, and the World Trade Organization; and the assignment of Internet names and numbers through the Internet Corporation for

Assigned Names and Numbers, all of which have been criticized as dominated by Western commercial interests.

In addition to infrastructural elements, the 21st century has seen the emergence of additional global media players. These include both nominally independent entities, such as Al Jazeera and Sky TV, and state-related operations such as RT and France 24. Operating in tandem with these and other news organizations are platforms such as Twitter, Facebook, and Weibo, which are based in a single nation but are truly global in reach.

Models of journalism remain in some meaningful sense national. This is because journalism normatively focuses on the political, and the nation remains the most important domain of politics. Global influences in the national arena tend to be considered intrusions or even infestations, signs of the vulnerabilities of the modern state in the age of globalization.

But only the most powerful states are able to define a model of journalism, and even in those states there are usually competing models of journalism. Currently, no state seems more capable of media governance than China, where state-related enterprises dominate the landscape. Media enterprises are all state-related; infrastructural players, including telecom companies, Internet service providers, and equipment manufacturers, are also under strict state supervision. China exemplifies a form of market authoritarianism—state control coupled with “neoliberal” market policies—that is increasingly in evidence in east Asia and elsewhere. But even in China, different models of journalism contend within the news sphere.

In the classically liberal countries, the multiplication of models of journalism is even more pronounced. In the 20th century, an ordinary model featured a public service sector—the exemplar would be Britain’s BBC—competing with profit- and market-oriented media. In the United States, media law distinguished between broadcast media, governed by the Fairness Doctrine, and print media, which were free from any such restrictions on editorial decision making. As public service media have lost ground to commercial media, however, markets for news have also undergone trauma that overturned traditional journalism norms. New “journalisms” have sprung up in response: public journalism, citizen journalism,

solutions journalism, engagement journalism, entrepreneurial journalism, platform journalism, and so forth. Some of these nest within traditional news organizations, while others inhabit new digital or network media.

Increasingly, the news system of any nation is a mélange of different models: some social democratic, some commercial, some sponsored by autocratic states, some algorithmic, and some alternative or vernacular. And increasingly all of these journalistic voices find audiences through the mediation of a platform that is itself neither national nor journalistic. The platform, which is the core of new media systems, thus becomes the horizon of comparative studies.

CONFLICTS OF INTEREST

Conflicts of interest in journalism can exist on both the individual and institutional level. Codes of ethics or organizational rules traditionally sought to maintain professional distance between reporters and their sources, while keeping news organizations free from financial or other pressures that could potentially bias their news products. Journalists have long prized their independence and ability to report the truth fairly and accurately, which is why, as a profession, journalism developed boundaries to protect individuals and institutions from both conflicts of interest and conflicts of commitment. However, as journalism has moved into the digital era with new business models and a softening of boundaries between types of mass communication, traditional barriers to protect individuals and institutions from conflicts of interests and commitments have been removed or reinterpreted.

This entry describes the scope of conflicts that impede (or can be perceived as impeding) journalists from doing their jobs and explains why even the appearance of a conflict of interest matters to journalists and their employers. Examples of individual and organizational conflicts are provided, along with an explanation of how conflicts have changed with the digital era.

The Journalist's Job

In a web-centric information era, journalists compete for public notice amid a cacophony of messages that includes those from entertainment, public relations, and advertising sources, as well as from news organizations that serve private or political interests rather than the public interest. Information that is in the public interest is balanced, accurate, complete, and relevant to citizens' need for educated self-governance in a democracy.

Traditionally, the initial role of journalist was that of gatekeeper. What counted as "news" were those issues and events chosen by editors and reporters to investigate and report. By the start of the 21st century, anyone with access to a computer, tablet, or a cell phone could be a news producer. Members of the public can access information from a world of sources without relying on journalists.

While the journalist's traditional roles as gatekeeper and primary channel of information to citizens have become outdated by digital technology, the social function of journalism remains vital to democracy. The responsibility of journalism as a social institution is to provide citizens with information needed for self-governance. The essential shared value that distinguishes journalism from other media and journalists from other information providers is that of providing balanced, accurate, complete information that is relevant to citizens' self-governance. In the virtual world in which journalism competes for audience members with many special interest outlets, the key difference is consistency and credibility in fulfilling that responsibility. Journalists and trustworthy news organizations must ensure that audiences recognize them as credible sources that provide reliable information.

Concentrated ownership of news outlets increased over the last half of the 20th century, resulting in a business model that seeks to produce the news "product" at the least cost and greatest profit. The potential conflict between making news and making money is ubiquitous. Traditionally, this issue was managed by the maintenance of a strict "wall" between the editorial function (newsgathering, reporting, and placement) and the business function (advertising and circulation). That wall has eroded throughout the industry. In addition, freelance journalists and nonprofit public interest repositories of news lack the resources to separate business from editorial pursuits. It is not unusual for fundraising and news production to occur among the same leadership team members or sometimes by the same individual.

Dispassionate Journalism

The idea of the professional journalist who strives to serve the public interest in his or her reporting is a relatively new concept, arising from marketing and technological concerns. Because of the infinity of information outlets, some are beginning to argue that the notion of journalism providing balanced, accurate, relevant, and complete accounts of an event or issue is simply outdated. Until 1850, journalists often used their reporting and writing skills to support political candidates or ideology while working for partisan newspapers. In the early 21st century, bloggers often play the role of partisan purveyors of information who provoke citizen response. *Washington Post* editor, E. J. Dionne, says that bloggers are important because "They draw people into the fight. They have made millions of people feel that their voices will be heard somewhere and, when aggregated together, can have a real influence on the outcome of policy debates and elections" (Dionne, 2006, p. 34).

Although a journalist or news organization prioritizing personal or others' private interests over that of serving the public has been considered an ethical violation for the last half of the 20th century, such "conflicts of interest" find their roots in technological and marketing concerns. In the 1800s, new technology such as the cylinder press allowed for cheaper printing, which placed newspapers within the budget of all readers. Rather than continue to serve the desires of political parties and

candidates, as they had for more than 100 years, newspapers reframed their public service to providing information for a mass audience with a broad range of political views. The editors who ran these cheap newspapers, dubbed the “penny press,” now viewed their role as providing a realistic view of contemporary life, exposing abuses, and reporting items of human interest for the audience members. As the news organizations wanted to hold on to as many readers as possible, any writing on politics now included a range of political perspectives.

The development of the telegraph, which allowed transmission of information over hundreds of miles in real time, prompted news organizations to share the cost of newsgathering. Rather than each news organization sending staff hundreds or thousands of miles to cover stories of interest to their local audiences, the newspapers formed cooperatives who sent one reporter to create news stories that could be appreciated by audience members regardless of geographical location or political ideology. This collaborative reporting required a product suitable for a “mass” audience, in which journalists could make no assumptions about their readers’ worldviews. The goal of producing an “objective” news account was based on providing information that could be filtered through any user’s political or personal biases.

While accurate reporting is touted as an important ethical principle today, it rests on technological and marketing values of the past. Through that notion of serving no special interest, the concern about conflicts of interests for journalists was born. In the 1800s, journalists and news organizations were known by their political affiliations. The return of a partisan press, in which audience members know to expect that coverage from Fox News will be different from that presented by MSNBC, for example, has led to a softening of concerns raised by what have been traditionally considered conflicts of interest. In a time of struggle between a partisan press and news outlets proclaiming to provide balanced coverage, transparency is essential. Citizens ultimately have the responsibility to seek different perspectives, but first they must be aware of biases that influence news coverage.

Operational Definitions

Individuals and institutions can have conflicts with external obligations and interests or within

internal roles and expectations. Some of these are conflicts of interests; others are conflicts of commitment.

Patricia Werhane and Jeffrey Doering (1996) define conflicts of interests as those “between professional interests and personal or financial interests. What distinguishes conflict of interest situations is that the conflict is between what one is trusted or expected to do in one’s role . . . and financial or personal influences or interests that will or could compromise one’s professional judgment and behavior in that role” (p. 51).

One scholar, Michael Bugeja, categorizes traditional conflicts of interests for journalists as follows:

Junkets: expenses-paid trips that make it attractive for journalists to cover events.

Freebies: gifts provided by corporations, such as free meals or tickets, intended to entice journalists to befriend or influence a media professional.

Bribes: outright payments or promises to buy services or goods in return for some favor. These are often aimed at organizations rather than individuals, such as a lawyer promising to purchase advertising from a TV station if the station’s general manager cancels an investigative consumer segment about a product manufactured by the lawyer’s client (Bugeja, 2008, p. 198). Individual journalists can be bribed as well with payments to induce positive comments in a report or payments for concealing damaging information.

Conflicts of commitment are those “that entail a conflict between two or more sets of professional commitments that will affect one’s focus of time, attention, and responsibility” (Werhane & Doering, 1996, p. 51). Conflicts of commitment can also occur between one’s personal and professional roles and between one’s professional commitment and a commitment to values or principles.

All individuals and institutions face potentially conflicting situations. However, while conflicts of *interest* can always be ethically managed through avoidance, recusal, or disclosure, conflicts of commitment may need to be balanced.

Nonmonetary issues, such as loyalty, may create conflicts as troubling as financial interests. It is

easy to recognize the ethical problem inherent in a journalist accepting a bribe to kill a story. Yet failing to report material at the request of a friend or a loved one is equally an ethical violation. Conflict of interest and commitment expectations are based on the principle that no interest—financial or otherwise—should deter a journalist from providing citizens with information needed for self-governance.

Individual Conflicts of Interest

Conflicts of interests for individuals can be obvious, such as a reporter having romantic or sexual interest in a source or a story subject or accepting a bribe to keep information out of a news story. These types of conflicts could (and do) easily compromise an individual's ability to meet his or her professional obligations. Other common types of conflicts of interest include competing employment interests.

Most professional newsgathering organizations provide guidelines regarding the need for journalists to avoid individual conflicts of interests. For example, the Society of Professional Journalists says in its Code of Ethics, "Journalists should be free of obligation to any interest other than the public's right to know." Along with "avoiding conflicts of interest, real or perceived," and disclosing "unavoidable conflicts," members are counseled to "remain free of associations and activities that may compromise integrity or damage credibility," "refuse gifts, favors, fees, free travel and special treatment, and shun secondary employment, political involvement, public office and service in community organizations if they compromise journalistic integrity," and to "deny favored treatment to advertisers and special interests and resist their pressure to influence news coverage" (Society of Professional Journalists, 2014).

After eschewing such codes for years, the venerable New York Times developed its own "policy" on ethics, prompted by a series of scandals in the early 2000s. This policy notes that "at a time when two-career families are the norm, the civic and professional activities of spouses, household members and other relatives can create conflicts or the appearance of them." The 14-page document covers a variety of potentially conflicting situations and makes clear that the company will not tolerate

behavior that might interfere with a journalist's neutrality or give the perception of interference, on or off the job. *The New York Times* policy requires that freelance journalists who provide work for the Times "avoid conflicts of interest, real or apparent" (New York Times, 2019).

Journalists who gather and produce images and sound are held to the same standard as their print counterparts. For example, the National Press Photographers Association Code of Ethics says, "Do not accept gifts, favors, or compensation from those who might seek to influence coverage," and "Avoid political, civic and business involvements or other employment that compromise or give the appearance of compromising one's own journalistic independence" (National Press Photographers, 2006). The Radio Television Digital News Association acknowledges that "Editorial independence may be a more ambitious goal today than ever before. Media companies, even if not-for-profit, have commercial, competitive and other interests—both internal and external—from which the journalists they employ cannot be totally shielded. Still, independence from influences that conflict with public interest remains an essential ideal of journalism. Transparency provides the public with the means to assess credibility and to determine who deserves trust" (RTDNA, 2015).

Regardless of organizational expectations, freelance journalists or those who work for Internet-based information providers must avoid conflicts of interest to maintain credibility and their own integrity. While users may find journalists who have no corporate ties easier to trust, they may be compromised as well. The Federal Trade Commission controls false or misleading information on social media and requires that any "material connection" between a writer who endorses a product or service and the advertiser or marketer be "clearly and conspicuously disclosed." This includes "a business or family relationship, monetary payment, or the gift of a free product." Disclosures are to be placed at the beginning of a post, above the "more" button (FTC, 2017).

Institutional Conflicts of Interest

Two years after Disney acquired the American Broadcasting Corporation (ABC), ABC pulled an

investigative television news report regarding pedophiles working at Disney theme parks. The network did not disclose the reasons for why the story did not run, making the appearance of a conflict of interest with the parent company inescapable.

According to one study, more than 40% of journalists and news executives surveyed admitted that they had engaged in self-censorship by purposely avoiding newsworthy stories or softening the tone of stories to meet what they perceived as institutional expectations. Market pressures were most often cited as the reason for such self-censorship. More than one third of all respondents said news that might hurt the financial interests of a news organization is sometimes or often ignored. More than one third said they censored themselves because of personal career concerns (Croteau & Hoynes, 2006, p. 179).

Whether for-profit or nonprofit, news organizations have always had to make money cover the costs of operations. But the late 20th century saw a shift from news organizations owned by an entity that produced only news to ownership by conglomerates with a variety of interests. When ownership values changed from producing the highest quality news product to producing dividends for stockholders, news managers were hired precisely because they shared those values. "By the 1980s, the consolidation of media ownership put businesspeople, rather than journalists, in ultimate charge of news divisions" (Croteau & Hoynes, 2006, p. 167).

Market pressures are discussed within the journalism ethics literature but are rarely labeled as the conflicts of interest that they are. For example, a story on the front page of the Arts section of December 4, 2007's *The New York Times* says, "Morning programs like *Today* on NBC and *The View* on ABC are the modern equivalents of the old Barbizon Hotel for Women, a frilly haven where men were not allowed above the first floor—or here, after the first hour—and viewers are treated to diet tips, ambush makeovers, cancer health scares, relationship counseling and, of course, shopping." These shows "have blurred the distinction between consumer news and product promotion." Despite noting that "[i]t used to be that hosts who are part of the network's news

division maintained an air of neutrality during consumer segments; now they are in on the pitch," the blurring is treated as an extension of the status quo: "Product placement is hardly a new phenomenon, and the morning shows long ago mastered the quid pro quo of daily television: Actors give interviews timed to their latest projects; authors are recruited as experts just as their books hit the stores" (Stanley, 2007).

Most observers, along with news organization owners and managers, simply note how economic values are replacing news values. To call these organizational conflicts of interest by name would imply that the organizations have an obligation to address the ethical implications of failing to meet their responsibilities to citizens. Yet the conflict is clear to scholars who address it directly:

The responsibility of journalism to report fully and fairly on events of the day has the potential to clash with the interests of corporate parents to promote their businesses and minimize any negative news about their operations. In addition, because their business interests are so broad and far-reaching, there are very few economic or legislative initiatives that do not affect some part of a media conglomerate. (Croteau & Hoynes 2006, p. 185)

News media credibility rests on citizens' assumptions that their news source is choosing material based on the public interest and is presenting information that is balanced, accurate, relevant, and complete. Anything that challenges this assumption weakens the credibility that separates journalism from other sources of information. Individual journalists are dependent on the news organization to provide the conflict-free latitude for them to do their own best work.

Conflict Examples

Conflicts of interests arise when an individual's or institution's self- or financial interest may conflict with the priority of producing news in the public interest. Easiest to notice are financial conflicts, and certainly those are many and varied. Most news organizations, as is the case with *The New York Times*, prohibit newsroom employees from buying stock or engaging in financial transactions

if there is a possibility that they had inside knowledge due to their journalistic status. Journalists are almost always prohibited from accepting compensation from any potential news source or story subject. Generally, they are not allowed to accept anything of value from anyone other than their employer unless it is something also offered to the public. For example, journalists are allowed to accept and use frequent flyer miles that they earn on business or personal trips, but may not accept free flights from the airlines.

Managing conflicts of interest when journalists do work on their own behalf, like writing books or maintaining websites, is trickier. The material contained in a news story or production is usually a very small portion of the information that the journalist has collected. It is not unusual, therefore, for a journalist who has been involved in a long investigation or ongoing news story to be approached by an agent or publisher wishing to turn that journalist's observations and expertise into a book-length manuscript. *The New York Times* bans journalists from using such experience "until the news has played out." *The New York Times* staffers who host their own personal webpages or blogs are counseled that they cannot completely separate themselves from their professional connection with the *Times*. They are told that they must bear in mind "the need for neutrality on divisive issues" (New York Times Company, 2019). In a world in which journalists have varied opportunities to contribute to the public discussion, news organizations have an affirmative duty to publish clear guidelines for employees that are available to audience members as well.

Developing an intimate relationship or a close friendship with a source is also considered to be a conflict of interest. While there may not be a financial component, sustaining the relationship may take precedence over following one's news judgment. Similarly, the desire to produce an award-winning story or picture may interfere with news judgment. But, while it is possible for news organizations to disallow close relationships with sources or require disclosure of relationships with potential newsmakers, it is more difficult to control an individual's drive for reward. But through initial training and appropriate prioritizing of values in the newsroom, journalists learn and are reminded that the goal is to produce great news,

rather than simply to produce the kind of stories that they hope will catch the eye of a judge in a contest. This kind of conflict is often more of an issue for visual journalists. Something that everyone in the newsroom agrees is "ahellova picture" may be used for its sensational value rather than its newsworthiness.

News organizations have a combination of interests in making news and making money. Whether they are complementary or competing depends on management. A classic example of an institutional conflict of interests is the *Los Angeles Times*/Staples Center case. The *Los Angeles Times* devoted its complete Sunday magazine in October 1999 to coverage of the newly opened Staples Center arena. The journalists who worked on that section did not know that news and business managers had secretly entered into an agreement with Staples Center owners to split the advertising profits from the magazine. When the truth was discovered, readers and reporters were appalled and top managers lost their jobs. But this was no accidental slipup or surprising error in judgment. Instead, it was the culmination of the 2-year reign of publisher Mark Willes who "announced that he was dismantling the wall between the paper's business and editorial departments, saying he'd blow it up with a 'bazooka' if necessary. Willes contended that the two could work together to help the paper, without allowing advertisers to influence news decisions" (Croteau & Hoynes, 2006, p. 171).

While this example is an extreme form of "ad-formation," the hybrid of advertising and information, some forms of ad-formation are commonplace. For example, most newspapers feature "special" topical sections on a regular basis, on subjects such as science, computers, food, cars, and homes. The reader must look carefully to determine which parts of the section are written by editorial staff and what is written, and thus financed, through the advertising department. According to Croteau and Hoynes (2006), "At the *Oregonian*, the advertiser-friendly home and auto sections are simply written by the ad department. The *Denver Post* turns over the production of its skiing, gardening, casino gambling, and other sections to its advertising department" (p. 175). In the absence of disclosure, few readers know whether the food section is sponsored by

advertisers or is produced by reporters. It is not unusual for local weather pieces to have local sponsors. It is seldom known outside the newsroom whether the piece on the local hospital's latest diagnostic tool running on the news program was really produced as news by the station or whether the station is simply running a video news release produced by the hospital's public relations department in the hopes of generating business for the expensive machine. The lack of transparency by news organizations in this regard creates the appearance of a conflict of interest. If the origin of a piece raises doubt, credibility is lost. As even the appearance of a conflict erodes journalistic credibility, ideally, news organizations have an obligation to separate advertising and sponsorship from all news production. Sponsored "news" should be clearly disclosed and not made to resemble editorial material.

However, conflicts of interest can develop simply because it is cheaper for news organizations to accept what sources provide—press releases, video news releases, and photo opportunities—rather than to conduct independent and time-consuming newsgathering. When the priority is cheap news production, diversity is one of the casualties. The least powerful and most vulnerable members of the community have the least access to marketing techniques and knowledge. They are least likely to be represented and their stories are least likely to be told when news organizations rely on advertisers, marketers, and other special interests to provide news.

Another potential conflict is "transaction journalism," where news accounts are tied to the promotion of products. For example, some online news sites have review sections with links to online booksellers. Whether the newspaper gets a percentage of resulting book sales is not visible to the reader. The connection between review and product sales produces, at least, the appearance of a conflict of interest. Positive reviews are more likely to result in sales than negative reviews.

There is also reason for concern about the subtle trend toward making news more entertaining. "Sex, violence, spectacle: these sorts of programs are the logical end products of the corporate pursuit of profits. They are relatively cheap to produce and, like an accident on the highway, they

predictably draw a regular audience. What these programs lack, however, is any sense of serving a larger public interest by providing substantive content" (Croteau & Hoynes, 2006, p. 164). In the conventional vernacular of local television news, "If it bleeds, it leads." The most visually dramatic or sensational (e.g., crime) story is far more likely to appear on the website home page than the story that may be more relevant to self-governance, but also predictably less dramatic. Click-bait that attracts readers may not result in more informed citizens even if it draws users to a website.

It is not enough to note the drift in the industry from news values to commercial values. Just as for-profit hospitals have a responsibility to provide high-quality patient care despite the interests of the stockholders, so too do news organizations have a responsibility to provide information that citizens need for self-governance, regardless of economic interest.

Conflicts of Commitment Examples

Individual journalists' conflicts of commitment most often arise in the social activism arena. It is natural that journalists should be passionate about political issues and social justice. *Caring* about the news is certainly an essential element to doing a good job of gathering and reporting the news. However, many news organizations and individual journalists have a hard time determining where to draw the line regarding civic participation. Marching in a rally or posting political signs in one's front yard is a conflict of commitment, while donating money to a cause, particularly if the contribution is anonymous, often is not.

The closer a journalist's personal connection is to a newsworthy matter, the more difficult it becomes to justify their covering the story. For example, a *San Francisco Chronicle* city hall reporter and photographer were taken off coverage of "marriage for gays and lesbians, because they were among the thousands of same-sex couples who received marriage licenses through the city" the day that they became available. The determination was made on the basis "that *Chronicle* journalists directly and personally involved in

a major news story—one in whose outcome they also have a personal stake—should not also cover that story” (McBride, 2004, pp. 1–2).

Personal involvement in a story damages the journalist’s ability to be unbiased or to be perceived by the audience as unbiased. But so does public political and civic involvement. The question is not *whether* journalists are allowed to participate in matters of social importance. It is rather whether journalists should be allowed *additional* participation in matters of social importance. Journalists are active in the community by nature of doing their jobs. Additional participation provides them additional power to that which they already enjoy. Journalists, through their professional choices of what to cover and how, have more power to influence community interest than any other industry. As the journalist’s personal power and credibility rides on the coattails of the news organization, it is impossible to effectively separate the two. It is harder for a news organization to declare that it provides balanced and fair coverage if its reporters are perceived by audience members as advocates.

Institutional conflicts of commitment also arise over the role of the news organization as good corporate citizen. News media are often involved in local philanthropy from having their own “People in Need” or “Send a Kid to Camp” fund with stories that highlight an individual’s need to involvement in the local United Way campaign. Fundraising efforts by news organizations or publishers or editors who serve on community advisory boards interfere with their journalists’ ability to do independent reporting. Nothing in the community should be above scrutiny. Social service agencies can fail to meet the needs of their clients. Philanthropic organizations can be the site of scandal and misuse of funds. But careful journalistic scrutiny of a cultural, philanthropic, or social service organization is less likely if a news manager serves on the board.

Perhaps most troublesome is the role that the charity United Way plays in most newsrooms. “Of all the charities and non-profits that exist within a community, only United Way gets the benefit of wide-spread payroll deductions. Few fund drives involve reporters receiving pledge cards with their paychecks. Even fewer can boast

of newsroom ‘volunteers’ who follow up with colleagues, checking to ensure that everyone has ‘had the opportunity to give’” (Elliott, 1991). United Way implicitly gets managerial approval that results in newspapers and programs that keep track of the success of the fundraising drives with plenty of stories to encourage citizens to give. United Way, and the agencies under its wing, get less journalistic scrutiny.

Attachment to government can also be a problem. It is conventionally understood that journalism serves as the “watchdog” on government. Part of what citizens need to know is what government is doing and any controversies regarding those actions. In a time of national crisis, citizens need news that critically reports U.S. governmental actions and how they are being perceived in a global context. Citizens do not need journalism that simply repeats officials’ perspectives or panders to the latest public opinion poll. The 21st century rise of partisan news programming creates an urgent need for citizens to seek news from alternative sources.

Equally troublesome, but conventionally accepted, is the role of news organizations in endorsing candidates or voter initiatives or weighing in on controversial civic matters through editorials. Along with offering a public forum for citizen and external commentator opinion, news media present their own well-reasoned arguments in favor of or against a variety of public issues. While some news sites erect a “wall” between those who write news and those who write editorials, the separation is rarely apparent to audiences.

CONGRESS AND JOURNALISM

Congressional journalism has been a part of the news media landscape since the founding of the United States. Likewise, journalists and members of Congress have shared an important, working relationship for well over two centuries. Both perform vital functions for American democracy—Congress as the primary policymaking and representative body for the nation, and the media as informer and watchdog of its activities. However, changes in both institutions—including for the professionals working inside them—as well as larger historical developments in the United States more broadly, have led to media portrayals that are in many respects not flattering to either one.

Although detailed and informative news coverage of Congress can be found in certain outlets, major changes in the media and political environments have led to shrinking coverage overall and a generally more cynical, adversarial tone in that coverage since the 1970s. Scholars have indicated that journalists' framing of the institution's work is one reason the public has a low opinion of Congress. Congressional news reporting is to some extent influenced by the subjects themselves, as well as a political culture that mistrusts and ridicules politicians. This entry first discusses the characteristics of Congress that influence how it is covered, then looks at how news coverage of the institution has changed over time. The entry then discusses how scholars view the news coverage of Congress and its effects and how newer platforms, as well as social media, have influenced congressional news coverage.

Congress is the most accessible, decentralized, and dynamic branch of government and likewise the most democratic. These features make it relatively easy for reporters to get information, build stories, and document and comment upon the activities that make up the legislative process. Members of Congress are usually eager to speak to reporters so as to gain coverage and get their message, name, and image before the public.

But Congress is also the most fractious, complicated, rule-bound and incomprehensible of the three branches of the U.S. government, making it hard to convey “what’s going on” in a simple, clear fashion, keep track of the actors and the action, and accurately portray its role to a mass audience. So much is happening in different venues, and with procedural variations that only experts can understand, that telling any congressional story can be challenging.

Furthermore, though Congress is the most democratic branch, it is also the least efficient and most internally conflicted. Its openness also reveals the messiness and ugliness of the democratic process. As a result, the media tend to portray Congress in a negative light and to focus more on the personalities, foibles, scandals, and battles that are part of its functions, arguably helping to fuel public disdain for and cynicism about Congress.

Development

During the first decades of its existence (1790–1850), members of Congress generally had the upper hand in dealing with the press. They tightly controlled access to congressional proceedings, as most committee meetings were off-limits to members of the press. The Senate did not even open its floor proceedings until 1795 and continued to keep nomination and treaty debates secret until the 20th century.

The line between reporter and propagandist was not always clear, as members generally had close relationships with the journalists who covered them, sometimes hiring them in the periods between congressional sessions as clerks and secretaries and giving them other patronage duties. Government printing contracts were also doled out to supportive papers. A prime example of this was the *National Intelligencer*, which was the dominant newspaper of the Capitol in this period. For years, its two publishers, William Seaton and Joseph Gales, were the sole reporters for the House and Senate, respectively, and had close ties to Thomas Jefferson’s Democratic-Republican party, which was then in control of Congress. They were also the official printers of Congress from 1819 to 1829 and began compiling official reports of the activities of Congress, the precursor to the *Congressional Record*.

Because the locus of national power in the 19th century was centered firmly in Congress rather than the presidency, the congressional beat grew in importance and stature. Given the growth of the partisan press into the mid-19th century, the trend of favorable coverage for many members continued, since often their partisan patronage or political connections back home included that of allied newspaper owners and editors—with the exception of those aligned with the opposition party.

More “objective” journalism became the norm later in the 19th century, leading to more documentary and descriptive coverage of Congress’s members and legislative activities. By the start of the 20th century, the rise of muckraking and investigative journalism that exposed numerous scandals of industrialization brought about a more adversarial posture.

With the rise of radio and then television, coupled with the increasing power of the presidency (due to the increasing power of the federal government in domestic and world affairs), Congress ceased to be the main engine of political power. Congressional coverage decreased and became more specialized. Stephen Hess, in his 1981 book *The Washington Reporters*, classified Congress as a second-tier news beat in terms of prestige, behind others such as diplomacy, general national news, the military, and the White House.

In 2015, there were over 6,000 journalists in the Congressional press corps, making it one of the largest in Washington. The total number of outlets regularly covering Congress had dropped slightly from 2005, however, reflecting media concentration. Using the rules in each of its chambers—the House and Senate—Congress issues credentials for journalists to cover it through official galleries, with separate ones for newspapers, magazines, and broadcast media outlets. In practice, however, Congress allows committees made up of congressional correspondents to decide who may be part of its galleries. The primary criterion is whether the individual seeking a press pass earns their living through journalism or related activities, as lobbyists or paid political consultants are prohibited. Since the late 1990s, there have been attempts to broaden access to members of the online media, opening new issues about who is a “journalist.”

One thing that has not changed over time is the need for journalists to regularly cultivate congressional sources. Indeed, in covering the institution, journalists, along with members and their staffs, must come together in order to make news. Timothy Cook calls this a “negotiation of newsworthiness” and likens it to an elaborate dance. Both have something the other wants: Journalists want information and need sources around which to craft their stories, and politicians want media coverage to help get their message and issues out to constituents and gain favorable attention. Yet each is also independent of the other, as members and their staffs try to manipulate or stage news to their advantage, and choose whether and what kind of information they give out, while reporters try to resist being mere dupes for congressional news management and choose what information they will use and how it will be presented or framed. It is this interaction that creates the nature and content of congressional news.

Current Coverage

Researchers who have examined news coverage of Congress in the late 20th and early 21st centuries generally have found that it does not show the institution in a positive light nor does it promote a comprehensive understanding of policy or the legislative process.

Decline and Negativity

Coverage of Congress has been decreasing—especially when compared with the executive branch—and also has become more negative and combative. Studies have shown the congressional share of the “news hole” in major newspapers (such as *The New York Times* and *The Washington Post*) and the major broadcast television networks has been declining since the late 1970s. One key factor was the role of television that made the president more important, visible, and appealing. Another was a declining interest in politics and government among the public, leading media to focus more on “lifestyle” issues and “infotainment” (soft news about entertainment celebrities, popular culture, and the like).

Congress arguably suffers in comparison to the president for several reasons. As a single figure

elected by the entire nation, a president is an interesting individual known by all who is easy to depict to a national audience, whereas Congress contains a diverse group of 435 representatives and 100 senators that rarely speaks with one voice. Likewise, the legislative process is complex and is hard to explain and has many avenues of action and players in the game, as opposed to the simpler, often more exciting actions of a chief executive.

What coverage there is of Congress, beyond mere description of its actions or inactions, is also increasingly negative. Arguably, Congress has never been revered within our political system, since senators and representatives, along with their legislative wheeling and dealing, reflect the worst tendencies of politics in the public mind. However, scholars now document that the amount of generally descriptive, even neutral-toned congressional coverage has shrunk dramatically.

The more analytical, critical, and interpretive genre of reporting that grew out of the Watergate scandal of the administration of President Richard M. Nixon in the early 1970s also impacted Congress, leading to more critical, penetrating, “gotcha” journalism that painted an unflattering picture. This trend was coupled with a more sensationalist or at least “infotainment” news genre driven in part by increased competition between media outlets. The result has been a focus on the dark side of congressional behavior at the expense of a more balanced view presenting the larger number of members who do their jobs honestly and well. Coverage now emphasizes scandals and malfeasance; bickering partisanship (the fight over the confirmations of Clarence Thomas, in 1991, and Brett Kavanaugh in 2018, to the Supreme Court; the impeachments of presidents Bill Clinton in 1998 and Donald Trump in 2019 by the opposition-controlled House); or members’ capture by unsavory lobbyists (such as the Jack Abramoff affair in 2005–2006). While scholars and media experts do not suggest events such as these should not be covered, a focus on scandal can drown out other news from Capitol Hill.

Inequalities and Biases in Coverage

Other notable patterns have emerged in terms of what and who gets covered. Senators attract greater

attention than House members. This is largely because there are fewer of them, they are more likely to have some issue expertise or leadership position, and they are more likely to be presidential contenders. More importantly, however, party leaders (such as the Speaker of the House, Senate Majority Leader, or committee chairs) are far more likely to get coverage than are regular “backbenchers” who hold no formal position within the Congressional power structure.

Other qualities that lend certain members greater attention, and hence newsworthiness, include taking extreme or controversial issue positions, being a “maverick” or taking stances that go against the mainstream of one’s own party, being from a large state or city, or being implicated in a scandal. Local media naturally cover their own delegation in Congress far more than other members, even those in leadership positions.

Further biases in coverage have also been identified. Female and ethnic minority members have been found to receive less, and more stereotypical, coverage than white males. African American members not only receive less coverage, they are often portrayed negatively, as being disproportionately focused on race and local issues. Female members likewise are covered as anomalies, overly concerned with such “women’s issues” as child care, education, or abortion. Their roles as wives and mothers in competition with their professional responsibilities is often emphasized, whereas male politicians’ home lives are rarely profiled.

Despite the increased diversity of Congress since 2000, with notable members such as Nancy Pelosi (D-CA), the first female Speaker of the House, and minority and/or women members such as senators Barack Obama, Cory Booker, Hillary Clinton, Elizabeth Warren, Kamala Harris, and Kyrsten Sinema, such coverage patterns largely remain. For example, Rep. Ilhan Omar (D-MN), who along with Rep. Rashida Tlaib (D-MI) became the first two Muslim women to serve in Congress after their election in 2018, received more coverage for her statements about her religion, her relationship with her spouse, and her ongoing Twitter dispute with President Donald Trump, than her legislative activities.

Naturally, subjects or pending bills that are the most newsworthy receive more press coverage than others. In practice, this means that major

legislation—such as the top priorities of the President or party leadership, including major spending bills—are covered more heavily than are minor or technical issues thought to be of interest only to a few. Legislation or debate on “hot button” controversial topics, such as abortion or gun control, are similarly more likely to merit media attention. Such coverage is important because controversy and conflict attracts readers and viewers.

Indeed, scholar Mary Layton Atkinson finds that the media’s negativity bias about the legislative process impacts views about the institution and its outputs. She also notes that “contentious” laws (those with partisan division) are covered by major media outlets at far greater rates than “bipartisan” or largely consensual, or landslide, legislation. Thus, “the news media’s focus on negative information about the ugly lawmaking process makes that information more prevalent in the minds of news consumers” than the substance of the legislation, and as a result, citizens “with a distaste for the partisan tenor of the debate often report disapproval of the plan itself,” even though they may otherwise like its policy components (2018, 13).

Legislation and the Legislative Process

Studies of how the legislative process is covered make clear that much congressional activity is not captured by the media. Bills and other legislation are covered as a political process but tend to be framed more in the context of a political “game” that emphasizes strategy and winning and losing rather than substance—a form of “horse race” journalism also seen in campaign coverage. Bills are usually covered only in their final stages, when they are nearing a vote. Committees, the so-called “workshops” of Congress, are generally ignored—sometimes because their deliberations are closed, but more often because they are deemed boring and hard to summarize. The exception is when they happen to hold public hearings thought to be exciting or controversial, such as those investigating a scandal or Senate confirmations of judicial or executive officials.

Committee chairs sometimes intentionally stage hearings for maximum media effect—such as when Judiciary Committee Chair Sen. Arlen

Specter called adult film star Linda Lovelace to testify in a hearing about child abuse legislation (because she had once been a victim), or when decades later the same committee called Stephen Colbert, a late-night satirical comic, to testify about immigration and migrant labor. Nevertheless, most studies conclude that journalists do a decent, if somewhat cynical, job in conveying the messiness of the legislative process and providing the basics of legislation.

Variations by Media Type

Differences among the media also lead to coverage differences. Print media have fewer time and space constraints than does television, for example, and can better encapsulate congressional work. The visuals and sound bites required for broadcast media often limit the effectiveness and breadth of congressional coverage. Indeed, Congress makes for more difficult television reporting, since it appears made up of people standing or sitting around talking.

There are also differences between local and national coverage. Local coverage tends to focus on members and their activities and is generally seen as more positive and deferential than national media. Reporters for smaller local newspapers and radio and TV stations have less time and space for, and professional expertise in, covering Congress. Indeed, most local media rely on news agency reports. Smaller media tend to rely more upon the press secretaries of their local representatives. But C. Danielle Vinson has found that local media coverage of Congress mirrors many aspects of national coverage discussed earlier and also appears to have become more negative in the process. Nevertheless, members spend considerable time and effort cultivating journalists from “back home,” in their attempts to positively impact voters.

Congress is viewed differently by outlets that specialize in the legislative branch. Publications such as CQ Magazine, The Hill, *National Journal Daily*, and *Roll Call* provide coverage for professional DC insiders (staffers, lobbyists, administration officials, and other professional Congress-watchers) who are an especially interested and informed audience. Their coverage is far more in-depth and analytical than that of the mainstream media and may include

coverage of players and processes not deemed worthy of attention by mass outlets. Reporters who specifically cover the congressional beat (regardless of type of media) generally have a greater respect for and appreciation of both the institution and its members.

Newer media services developed since the 1980s have also impacted the congressional-media relationship. Cable-Satellite Public Affairs Network has in some ways fundamentally altered congressional operations. Members not only use it to strategically communicate but also as a surveillance mechanism to keep track of what else is going on in Congress, in committee hearings, or on the House or Senate floors.

The rise of cable and Internet outlets, with greater consumer choice, has also to some extent led to a rebirth of “partisan media” akin to the earliest days of Congressional coverage. Partisan websites are now supplemented by networks like Fox News (conservative) and MSNBC (liberal), which in turn portray Congress as a loud den of heroes and villains. For example, through March 2019, freshman Rep. Alexandria Ocasio-Cortez (D-NY), a self-identified “democratic socialist” received more coverage on Fox than any of the Democratic candidates for president except Elizabeth Warren, another conservative target. In turn, these outlets provide a national soapbox for members, with Republicans vying to appear on Fox, and Democrats, on MSNBC. According to Richard Forgette, the effect of greater news competition for audience share creates a cycle of conflict-driven, partisan news which leads to audience distrust of the opposition, if not both sides—and when coupled with cynical satirical and “fake” news, leads to increased public disapproval of Congress.

The development of blogs, political websites, and social media outlets such as Facebook and Twitter have also altered the media and journalistic landscapes. Members now use online media to communicate directly with their constituents and other parties directly through two-way, even interactive formats. The emergence of online journalism has also created new outlets for coverage, commentary, and criticism of Congress.

CONSTRUCTIVE JOURNALISM

Since 2010, constructive journalism gained popularity and has since been frequently discussed in journalism practice and in the academic world. Constructive journalism uses a public-oriented approach that attaches great value to socially responsible journalism with a need to produce accurate news to avoid a negative bias. It critically questions conventional journalism and elaborates on the ways in which journalism has to change so it can contribute to a sustainable and tolerant society with involved citizens.

The idea that a constructive strategy will improve journalism is not new but was already suggested by the esteemed journalists Joseph Pulitzer and Walter Williams in the early 20th century. One hundred years later, the term was reintroduced and developed into a broader and more elaborate concept. This entry describes the origin of constructive journalism, how it is conceptualized and researched, and its practical implications and future challenges to its practice.

Origin of Constructive Journalism

Constructive journalism is not a completely new phenomenon but builds on previous counter movements that use a public-oriented approach. These movements, such as the social responsibility theory, peace journalism, civic journalism, and more recently, solutions journalism, all share a dissatisfaction with conventional journalism. They share a strong commitment to responsible journalism that is fair and accountable and acts in the best interest of citizens and society. According to these movements, traditional journalism disproportionately represents institutions, and the logic of power in society

and is too distant to the citizens and civil society it claims to serve. These counter movements oppose the sender-oriented journalistic discourse that was dominant throughout the 20th century and still is in much of conventional journalism. Compared to the conventional approach, these counter movements can be characterized as public-oriented, with a focus on how to stimulate public dialogue.

The renewed attention to a constructive approach can be understood against the background of socio-cultural, economic, and technological developments that have fundamentally changed the environment in which journalism operates. Under the influence of structural societal change, including digitalization, the mass media model that characterized public communication in the 20th century has been gradually replaced by a network model in the 21st century. This transition has severe consequences for the professional journalist, the public, and the news industry. During this process, journalism has lost its monopoly position as news supplier and a scarcity of news changed in an overflow of available information. Moreover, a relatively passive receiver of news has been replaced by an active news consumer who can decide what news they want to consume, along with the place and time they want to consume it.

Next to that, practitioners as well as scholars show a growing concern about the negative bias in news and the effects this can have on both news consumption and democracy. On an individual level, it can lead to apathy, disengagement, and feelings of powerlessness. Within society, the negative focus is likely to increase polarization and divisions.

The idea that constructive journalism can improve 21st century journalism first resurfaces in Northern Europe. It receives international attention due to two Danish journalists, Ulrik Haagerup and Catherine Gyldensted. Both argue that news overrepresents negative angles and reports excessively about conflicts, problems, and disasters, contributing to an unbalanced, negative worldview. However, they differ in their approach to the concept. Haagerup uses the term constructive news to indicate that he sees the constructive approach primarily as a shift in practice that should lead to improved news products. Gyldensted uses the term constructive journalism to indicate that she refers to a paradigm shift that goes beyond the quality of the product. She includes

the importance of an engaged role of journalists in society. Gyldensted combines insights from the field of journalism and the behavioral sciences, especially from positive psychology, to further develop the concept of Constructive Journalism and substantiate it with empirical research.

Meaning of Constructive Journalism

Constructive journalism states that the changes in society demand renewed attention to the way in which journalists fulfill their role. A public-oriented approach is characterized by the belief that journalists have a responsibility for the way they construct reality in their news coverage and for the way this news coverage impacts both the individual and society. Constructive news is expected to avoid the negative bias in the news and the negative effects it causes. This is not to say constructive news has to be positive news, but rather that the news provides context to socially relevant issues, without overemphasizing the sensational and what goes wrong.

As the role of journalists in society changes, constructive journalism does not see journalists as detached disseminators of news, but as committed facilitators or mobilizers. This active role implies that it is journalists' responsibility to make news that contributes to the empowerment of citizens and helps people to make well-considered decisions. Therefore, it is considered important to reevaluate traditional journalistic routines and values that underlie the decisions made in the selection and production processes of the news. Furthermore, because citizens are important actors in the news process, journalists should actively seek out knowledge of peoples' news preferences and needs as important input for their work.

What can be called constructive journalism does not seem easy to define in concrete concepts, but some principles have been formulated that can be helpful to define a constructive news approach: solution oriented, future oriented, and action oriented.

To further substantiate and develop principles of constructive journalism, empirical research started in the 2010s. Until recently, most studies addressed the question of whether using constructive elements in news has the expected positive effects on the personal level and motivates

individuals to act. Often these studies are theoretically embedded in positive psychology, more specifically the broaden-and-build theory developed by Barbara Frederickson.

Former news effect studies have indicated that exposure to emotional cues in media messages leads to similar effects and thus influences the way people think and act. Consequently, conventional news that often uses negative frames is likely to provoke negative feelings such as fear, apathy, and anger. This is underlined by international research on news avoidance published by the Reuters Institute for the Study of Journalism in 2017 and 2019. The most common reason respondents gave for why they consciously avoid the news was the negative effect it had on their mood. According to constructive journalism, the use of constructive elements can bring about the opposite and can have a beneficial effect on the state of mind of people. This is confirmed by research showing that incorporating constructive elements in news, such as a solution perspective, has the expected influence. Compared to conventional news, constructive news is found to decrease negative emotions and increase positive emotions. Using theories from positive psychology, a broadly applied constructive journalistic approach is expected to reduce feelings of fear and powerlessness and evokes feelings of understanding and hope in society.

Practical Implications

Constructive journalism emerged from journalistic practice and arose from dissatisfaction with existing journalistic methods and the resulting news coverage. To improve the quality of news, journalists need to act against the disproportionate attention given to conflict and what goes wrong. Therefore, constructive journalism calls for journalists to change their traditional mindset and to be open to new skills and practices that will frame their stories in ways that lead to productive change. To achieve this, a new, more creative news process is needed that focuses on new angles and ideas to replace standard ways of news coverage. A constructive approach looks beyond the previous so-called core questions of journalism: “Who,” “What,” “Where,” “When,” and “Why,” which are often seen as the most important angles to be

answered in news. Adding the questions “How” and “What Now” can provide a more complete depiction of reality and a better understanding of the world. Both questions go beyond the issue of the day and seek to provide context to these individual news stories and put them in perspective, which also includes the incorporation of possible or available solutions and future developments.

In daily practice, constructive journalism provides a supplement to the prevailing daily routines and should not be seen as a radical shift away from the core values. Journalistic values such as being critical, independent, and factual are still important and need to underly journalistic practice. Constructive journalism focuses on adjusting the journalistic attitude and develops guidelines that help journalists to make constructive decisions in producing news. These guidelines can be summarized as follows:

Deepening

Give context by offering a more complete insight through more explanation, broader context, and more attention to possible consequences for society and its citizens.

Empowering

Inform the public about existing and possible solutions for common problems and about possibilities to take action.

Future Perspective

Inform the public about the world, beyond daily events and incidents, while raising attention to long-term processes.

Inclusive

Include a broad range of perspectives and sources (representing diversity of layers and groups of society) and provide information that contributes to a public dialogue.

Cooperative

Involve the public actively in the process of agenda-setting, framing, and producing the news.

Inspiring

Inform the public about positive examples and developments and about people that made a difference.

Transparent

Give insight into the working process and be accountable for your choices and their impact.

These constructive elements are a mix of strategies that can be applied in several stages of the news process: choice of story, information gathering, source selection, and item production. Which strategies are suitable to use, depends on the particular news issue. Constructive journalism should therefore not be interpreted as a specific set of rules but rather as a broader mindset about the journalism profession.

Constructive journalism has begun to find its way in several news organizations around the world but mostly in the United States and countries situated in northwest and central Europe. Examples of news organizations that use elements of constructive journalism are BBC World, The Guardian Media Group, and *The Economist* in the UK; HuffPost and *The New York Times* in the United States; The DanishTV2\Fyn and Swedish Radio SR in the Scandinavian countries; Norddeutscher Rundfunk and *Die Zeit* in Germany; and De Correspondent and *Trouw* in The Netherlands.

Furthermore, there is an international Constructive Institute situated in Arhus, Denmark, that promotes the constructive news approach and provides workshops and training for professionals. Windesheim's School of Journalism in the Netherlands has adopted constructive journalism as a key concept in their education curriculum.

It is important to note that attention to constructive journalism started in countries with strong, democratic political systems in which the media are protected by the freedom of the press. However, recently the term constructive journalism has also been used in countries with (modern) authoritarian political systems, where media face government scrutiny and censorship. In these instances, constructive is (mis)construed to mean active support for the authoritarian government. While this does not fit the original understanding of the concept, it does raise concerns about the different ways in which core

principles of constructive journalism can be misinterpreted or misused.

Future Challenges

As a concept, constructive journalism provides a contribution to addressing the challenges journalism faces and to the reflection needed on how journalism can accomplish its public service function in the changed circumstances of the 21st century.

Despite increasing attention to constructive journalism, there is ongoing discussion on the importance of having an unambiguous definition and operationalization of the concept. On the one hand, being a flexible concept is seen as a strong characteristic, because the concept is open to ongoing insights and can be adjusted based on knowledge coming from practice as well as research. However, it can also be seen as a weakness, because the term constructive journalism runs the risk of being interpreted in such diverse ways, that it becomes a fluid, undefined concept without concrete boundaries. Even proponents of constructive journalism differ in their views on the operationalization and application of the concept.

One of the challenges that current research on constructive journalism faces is studying the effects of this form of journalism when it is not yet broadly used within the media. This has made research in the long-term effects on individuals and society difficult. As more elements of constructive journalism become part of the mainstream media, future research will be better able to expand the understanding of the effects of a constructive approach.

CONSULTANTS, NEWS

News consultants are specialists in the news process who provide “inside” expertise often from market research that assists newsrooms in building audiences and maximizing revenues and profits. Newspapers and web-based news services hire consultants for direction on content and design that increase their numbers of readers and users.

News consulting is most widely identified with television news, where newswriters not only provide content but do so in newscasts, in effect television “shows,” that each day and night are in direct competition with shows telecast by rival newsrooms. News consultants play an important role in selecting and directing a newscast’s performers, its anchors and reporters, whose on-camera delivery and “look” are essential to attracting audiences and determining a newsroom’s commercial success. This entry discusses consultants and newsrooms, as well as the process

of news consulting and criticism of consulting in the context of news. The entry also examines “Eyewitness News” and Social Class Theory, along with the talent function of news consulting.

Consultants and Newsrooms

The identities and activities of news consultancies rarely are known to the general public. Sometimes, their activities are not known to the newswriters they advise. They are small businesses typically independent of known media organizations which, often at high fees, are hired by an organization’s owners and senior managers. Operating in private, consultants propose audience-building tactics and strategies to managers who, in turn, communicate the consultants’ direction to newswriters through a newsroom’s chain of command.

News consultants have in common significant past experience in newsrooms. From their extensive backgrounds as hands-on news managers, newswriters, and journalists, consultants derive credibility as experts and informed providers of newsroom “action plans.”

While all news consultants are seasoned news professionals, the consulting field is diverse and broad. A news proprietor needing to diagnose a particular issue, such as the arrangement of items on a website, may hire a one-person “boutique” consultant.

Yet news consulting is most associated with corporate consultancies. Large-scale consultancies provide an array of services, most notably audience research. They cater to mainstream corporate media organizations, typically those prominent in television news and which own groups of stations, cable news channels, and streaming services with demands for profits that depend on an intricate understanding of audience behavior. In such environments, research centers the consulting process. By engaging the public in focus groups, surveys, social media analysis, and testing, consultants determine favored content, style, and news personnel. After implementing that which the public prefers, media organizations can expect larger audiences and profits.

The largest news consultancies are the firms Frank N. Magid Associates, Audience Research &

Development, and Smith Geiger. A fourth U.S. firm, Convergent Communication, is the successor to the first news consultancy McHugh & Hoffman, an enterprise important for demonstrating that news appealing to a working class male “mass” audience determines audience accumulation. The practice of news consulting originated in local television news in the 1960s and proliferated in the 1970s and 1980s. Following media consolidations, downsizings, and a shrinkage of clients in the 2000s, large consultancies shifted concentration to nonnews digital platforms and entertainment media. Yet they remain highly active in newsrooms.

The News Consulting Process

The use of news consultants occurs when a news-active media organization determines that its need to enlarge an audience justifies the expense of obtaining outside expertise. The need typically is demonstrated in audience ratings, notably those gathered by the Nielsen organization, which report a newsroom’s number of viewers. The larger a newsroom’s Nielsen rating, the greater will be the revenues it will generate from advertisers. Most often, a consultant’s client will be a television newsroom that trails in the ratings and understands that it is losing revenues that, as a ratings leader, it would be able to obtain.

A consulting process begins when a consulting team, typically a lead consultant and a research specialist, travels to the client newsroom, assesses its operations, and confers with the organization’s senior management. The consultants’ dealings soon narrow to the single individual, a news vice president or news director, in charge of news operations. While typically a journalist by background, the news director has executive duties above and apart from activities at the news desk. A news director’s principal responsibility is ensuring that newscasts attract audiences, maximize advertising revenue, and boost profitability.

The parties discuss the newsroom’s likely weaknesses. Consultants often suspect that content does not match viewers’ interests. Almost always, news “imagery” raises questions. Does the public identify with the client’s newscast? Does it trust the newscast for complete and accurate coverage? Is the newscast perceived as sufficiently distinctive

to draw audiences who may habitually rely on competitors’ news? The newscast’s style and “packaging” can be issues. Finally, and often the chief concern, is whether the public likes or dislikes the anchors and reporters who deliver the news.

Each issue is put before the public in two main types of audience research. Most common is the focus group. The other is field surveys in which researchers obtain data, often from as many as 1,000 randomly sampled respondents. Because audience ratings trace to the appeal of anchors and reporters, consultants apply special methodologies. One is the dial test, in which the public views test recordings of news personalities and registers approval through continuous metering. It is not uncommon for consultants to conduct experiments in which different combinations of personalities are auditioned and tested.

From analyses of the research, the lead consultant derives recommendations. Some are directed to senior management. They may call for investments in promotion and news-gathering technologies and/or the placement of newscasts in more competitive time periods. Most recommendations are directed to the news director. They likely will call for changes in news presentation that the research suggests will increase viewership.

While consultants and their clients maintain proprietary secrets, firms such as Magid, AR&D, and McHugh & Hoffman have placed several of their “action plans” in the public domain. In studies of them, scholars note that recommendations conform to preferences not of high-status viewers but of a middle and lower class “mass” audience. Content recommendations advise against routine coverage of government, politics, and institutional affairs in favor of breaking news, crime, and human interest subjects. Recurrent are recommendations for “news you can use,” such as crime prevention, money management, health, and, notably, weather.

Prioritization of a “mass” audience is evident in recommendations on newscast style and personnel. Consultants advise against strict and serious delivery in favor of fast-paced, friendly, and entertaining news presentation. While recommendations on anchors and reporters vary by personality, consultants rule out stern, sober, and typically older news personas. They advocate energetic,

charismatic, and typically younger news presenters capable of projecting individual personality while cultivating chemistry with others on the news team.

News directors are not obliged to implement any recommendations, nor do they act on all of them. However, studies show that news directors are highly attentive to recommendations supported by the consultants' research. News directors routinely terminate and replace anchors and reporters with unfavorable "Q scores." Studies further show correlations between content recommended by consultants and the content newsrooms provide.

Discussion and Criticism of News Consulting

News consulting is a subject of much professional and scholarly discussion and criticism. Traditional theories of news hold that journalists independently gather and report news as members of organizations whose purpose is to inform and serve the public. A chief question is whether the news process accommodates the consulting process.

The largest and longest running public examination of news consulting is that provided by critics of consultants, typically commentators, popular authors, and noted journalists. Prior to his passing in 2009, renown CBS newscaster Walter Cronkite devoted much of his career to encouraging the eradication of news consulting. Critics maintain that news work and news consulting are incompatible. They contend that news consulting transforms the purpose of news from public service to profit-making. They argue that news consultants impede the independence of journalists. They insist that audience research contaminates journalism by forcing newsmakers to pander to public taste and give the public "not what it needs but what it wants."

Consultants rarely engage in public examination of their role and function. They maintain they serve strictly as outside advisors; thus they have no authority either to transform a newsroom's purpose or impede journalists' independence. Moreover, they have defused detractors by pronouncing audience research as a tool that affords needed dialogue between the public and the news

community. A leading professional organization, the Radio Television Digital News Association, is on record as approving news consultants so long as they are not permitted authority in newsrooms.

Beyond professional discussion, news consulting has affected scholars' efforts to understand the news process. Scholars' two most-studied news theories, "gatekeeping" and "agenda setting," presume that newsmakers alone are responsible for news content and presentation. Neither theory considers profit-making as a news process factor nor does either provide for the application of audience research in news decision-making.

During the 1990s, when consulted newsrooms in the United States multiplied and numbered in the hundreds, scholars recognized a need to explain why researchers increasingly showed news conformed to profit-making measures directed by outside advisors with no newsroom authority. The first empirical studies of news consulting brought two theoretical directions. Together, they accommodate news consulting's role in the news process.

The first "news production" theory holds that, rather than a public service, news is a construction or "show" invented to attract an audience. Long suggested in television news and formalized by John McManus in 1995, the idea establishes market exploitation and profit-making as central conditions of news reporting when a news provider is a privately-owned, profit-making enterprise.

The second theory addresses news consulting's chief riddle: how advisors without newsroom authority impact the news. Adaptation of Warren Breed's 1955 theory of "news socialization" explains the anomaly. It holds that newsrooms are not free and creative domains but, like all organizations, directed by managerial prerogatives individually and collectively absorbed by workers. Breed emphasized "social control"—enforced by newsmakers' understanding they must conform to managers' philosophies and objectives or risk termination.

Studies by Dan Berkowitz establish "news socialization" as the theoretical lynchpin of the consulting process. A consultant's recommendation for reduced coverage of politicians and government would go to a news director. A news director would not commandeer a news desk and

order gatekeepers to comply. Instead, news directors translate recommendations into directions communicated as beneficial to the organization, in turn, to news workers. Directions pass downward through the newsroom's chain of command, first to producers and editors, then reporters, writers, and associates, until they become instinctive. Thus, as they maintain, news consultants do not dictate news production and reporting. Instead, they have impact from their ability to socialize, or in more vivid parlance, "influence" news workers.

"Eyewitness News" and Social Class Theory

News consulting is important for its historical role in designing and proliferating a universal concept for news presentation, one considered the paradigm for establishing on television a "news of the masses." This occurred with the consultants' invention of "Eyewitness News." While eventually a trade name, "Eyewitness News" originally was an alternative newscasting format. It became popular in U.S. local news in the 1970s. During the 2000s, American news consultants instituted the "Eyewitness" concept at newly privatized television networks in Europe and Asia.

Viewers had been accustomed to a newscast form personified by the venerable newscaster Walter Cronkite, a "stentorian" style in which an authoritative and lone male newscaster read summaries of the day's events. Upon the advent of "Eyewitness News," viewers witnessed a "family" news team with male and female coanchors, weather and sports, extensive visualized on-scene reporting, "news you can use," and staged studio effects for the first time.

"Eyewitness News" was inspired by noted sociologist Lloyd Warner, who from studies in the 1930s known as the "Yankee City Series" was the first to propose a theory of class stratification in the United States. The first news consultancy, McHugh & Hoffman, sprang from Warner's Social Research, Inc. (SRI), a market research institute at the University of Chicago that after World War II heralded a union between scholars and big business.

The first news consultants were PhD sociologists Warner assigned to McHugh & Hoffman. They had been students of Warner who as

research assistants contributed to his finding of five social classes—and differences between the roughly 25% of college-degreed and professionally employed Americans in the upper-middle class and the 65% of largely high school educated and rank-and-file Americans in the lower-middle and upper-lower classes. SRI helped shape the consumer marketplace with market research that distinguished the classes. Mass market enterprises that targeted the lower-middle and upper-lower classes, a group Warner termed the "Middle Majority," thrived.

At McHugh & Hoffman, SRI's sociologists applied Warner's theory in helping formulate "Eyewitness News." In 1968, New York station WABC enlisted McHugh & Hoffman. SRI's research showed that while the upper-middle class favored the "stentorian" style, lower-middle and upper-lower class viewers cited discomfort with its detachment and distant and complex content. McHugh & Hoffman proposed, and WABC implemented, most of the innovations that identified the "Eyewitness" concept. Among them was personality projection. Newscasters interacted and joked with one another in a technique known as "happy talk." WABC's news ratings tripled.

In 1970, a former University of Iowa sociologist schooled in Warner's theory, Frank N. Magid, entered the news consulting field. At WPVI in Philadelphia, Magid's research emphasized the Middle Majority's brief attention spans. Magid proposed a shortening of news stories, and the replacement of long interviews with abbreviated "soundbites," in order to achieve a fast-paced news presentation. The result was a variation of "Eyewitness News" called "Action News." WPVI quadrupled its ratings.

Upon these ratings successes, McHugh & Hoffman and Magid swelled with clients. In turn, guided by Warner's theory, both news consulting and devotion to the average middle-class male viewer became entrenched in television newsrooms.

News Consulting and News Talent

Much interest centers on news consulting's "talent" function. Elemental in consultants' research is an item that reads "Why do you choose Channel X for news?" Invariably and often overwhelmingly, viewers cite not the news, which they regard

as the same regardless of news provider, but the personalities. Thus, imperative in distinguishing a newscast apart from competitors, anchors and frontline reporters are proven as the key to attracting audiences and achieving commercial success news.

Accordingly, the consultants' talent function is extensive. Large consultancies team with "boutique" consultants in grooming and coaching potential "star" anchors. Research is exhaustive. From specialized methods such as dial tests, consultants report "Q scores" on anchors and reporters. A consultant's plan for enlarging an audience often amounts only to recommendations calling for the replacement of low-scoring presenters with more audience-appealing personnel. Such recommendations can call for clients to raid the anchors and reporters of competing newsrooms whose Q scores are superior. Consultants further can facilitate personnel changes through national "talent banks" where dossiers and audition videos on high-scoring anchors and reporters are kept in secret.

Although they determine the careers of those who aspire to on-camera roles, the consultants' talent research and dealings are among their most closely guarded secrets. Yet some light is shed in scholarly studies of a phenomenon known as *para-social interaction*, in which individuals are shown to form vicarious relationships with television personalities. The idea emerged in 1956, when psychologists Donald Horton and Richard Wohl observed a *para-social response* among soap opera viewers who described one-way so-called friendships with TV performers. In studies, including those of Alan Rubin, researchers have established that in TV news viewing, viewers attest not only to forming vicarious relationships with certain news anchors, even "talking" to them during newscasts, but also to the fact that their so-called friendships motivate their selection of a channel or network for news.

Much remains unknown. It is possible that consultants act on something akin to parasocial interaction. Evident in a high Q score is measure of an anchor's ability to bond with audience members. A dial test instantly exposes which anchors are and are not those an audience might choose to befriend. When consultants coach anchors and reporters, directions on voice, mannerisms, and appearance may aim at teasing and manipulating a parasocial effect.

The consultants' talent function has critical implications. Alleging consultants' emphasis on charm and beauty rather than journalistic skills, detractors maintain that had consultants existed when Walter Cronkite's career as a newscaster began, he would have been replaced. While consultants reply that they have no authority and merely provide recommendations, it is certain their role in newsrooms includes weeding out and waving on some of those who pursue careers as reporters and presenters of news.

CONVERGENCE

Convergence is the merging of media, for example, the merging of newspapers, radio, and television on the Web. It also includes the merging of characteristics associated with traditional one-way media with characteristics of online and social media such as interactivity, serving different content to different users based on algorithms of users' behavior, and links to other stories and sources of content. There are many dimensions to convergence, including business consolidation, technology integration, functional convergence of news services, convergence on social media, audience fragmentation, geographic convergence, and changes in government regulations that make convergence possible. Convergence is also a buzzword that has come into popularity, fallen out of favor, and moved back into popularity again. It is a response to rapid changes in technology and shifting behaviors of consumers. Some scholars view convergence as the inevitable result of the changing media environment. Others view it with alarm, arguing that it is driven primarily by the profit motivations of large media conglomerates. Still others argue that it has benefited large media entities but harmed many smaller news organizations. For students of journalism, convergence has implications for the training they need, how they produce news in the future, and how they conceive of news distribution in a multiplatform media environment. This entry offers a brief history of media convergence and discusses several dimensions of convergence. The entry also examines convergence with respect to social media as well as obstacles to convergence and its potentially negative effects.

Brief History

Media convergence has been underway for some time. Some trace its origins to the convergence of computers and telecommunications, for example, the development of Arpanet by the U.S. military

and the introduction of videotex services such as Prestel in the United Kingdom, Minitel in France, and CompuServe in the United States during the 1970s and 1980s. These services carried text, data, and, in some cases, graphics over telephone lines for display on computer monitors or dedicated terminals. Cable and satellite technologies in the 1970s and 1980s also fostered convergence, for example, when CNN merged television news with a dedicated cable channel and satellite distribution. By the early 1990s, most news organizations recognized a need to repurpose content for multiple media to satisfy different customer needs and tailor content to the characteristics of different media. In the 2000s and 2010s, many start-up, Web-only news organizations emerged, accepting a converged media environment as a given for doing business.

Everette Dennis (2003) identified four stages in the history of convergence. The first was an awakening of recognition that computing was becoming a core component for many media industries. Second, the Internet became a practical tool for millions of households in the 1990s, providing news, games, ecommerce, and email. The third stage was an uncritical acceptance of the Web as a dominant new medium that would take over many media industries. A fourth stage, in the early 2000s, was the presumption of failure of that model and a renewed confidence in older business models for media following the collapse of many so-called dot.coms. However, this was a temporary bump in the road. Convergence as a concept and a process made a roaring comeback in the 2000s and 2010s with the widespread acceptance of online services and the emergence of social media as a multifaceted source of news, entertainment, commerce, and messaging.

The Many Dimensions of Convergence

Business consolidation is one cornerstone of convergence. It has been underway for some time. Consolidation of media properties began with the formation of large chains of newspapers and groups of TV and radio stations under the ownership of a single company during the second half of the 20th century. It picked up speed in the 1990s, as very large media conglomerates were formed, for example, the merger of Time Inc. and Warner Communications into Time Warner or the

acquisition of Cap City/ABC family of networks by Disney. Consolidation continued to flourish in the 21st century, for example, in AT&T's acquisition of Time Warner and Disney's acquisition of 21st Century Fox.

Media conglomerates typically control a number of subdivision companies across multiple media platforms, for example, newspapers, TV stations, magazines, websites, and social media platforms. One impact of business consolidation has been that companies seek efficiencies in operations across their media properties. This may involve a reporter at a newspaper writing stories for the company's websites and TV news operations. A variation of this process is for a story written specifically for one medium to be adapted or repurposed for another medium. On the business side of the organization, a salesperson may sell advertising for the company's newspaper and websites, or programmatic ad buying and selling may automate the process across multiple platforms. Often, facilities are consolidated, so the staff of a newspaper may work side by side with the staffs of a TV station and the company's website personnel. With modern telecommunication links such as fiber optics, it is possible to create a virtual staff consolidation in which people at different locations can communicate and share resources as if they were in the same space. However, there are many variations in how newsrooms are organized based on the size, composition, and management style of the news organization.

The technological integration of media, for example, devices that provide text, music, graphics, videos, and other forms of communication is a second cornerstone of convergence. Technological integration was made possible by the digitization of media in which all forms of content are transmitted as streams of data. This makes it easier for one device to provide more robust multimedia content. Perhaps the most versatile media device is the smartphone, which has access to millions of apps—more than 2 million apps in Apple's App Store—which converge onto this mobile device.

Convergence also involves the functional merger of services. This is most notable on the Web, where a news site may have stories in multiple formats, along with reader forums and comments, blogs, polling, and interactive maps. Many interesting new formats have emerged, for

example, audio podcasts, some with photos or videos and commentary by a reporter, photographer, or expert on a topic. Some mergers of content are more controversial such as the merging of information and entertainment into *infotainment*. Critics see this as a degradation of professional journalism. Others argue that some infotainment services such as *The Daily Show* on cable TV or *The Onion* on the Web are legitimate and useful forms of satire. More sinister is the creation of fake news and deep fakes, which manipulate content to deceive. The creators of fake news have the same technological tools in a converged media environment as legitimate news organizations.

There is a seeming contradiction between the convergence process (the coming together of media) and the proliferation of media devices. In reality, both are happening. People use more media devices than in the past, but the technologies they use have more features and services. One consequence of the proliferation of media devices is the fragmentation of audiences. Most people in a town do not read the same morning newspaper and watch one of the three network newscasts in the evening, as millions did decades ago. News consumption is scattered across a broad range of media services. Convergence, in the sense of publishing news on multiple platforms, is one way of dealing with audience fragmentation. This is supported by algorithmic filtering: computer processes that categorize content and then filter it to individuals based on their past history of selecting content. A second consequence of the new media environment is that many people consume news on the Web in bite-size chunks rather than a dedicated session of watching or reading a menu of news content in a newspaper or on television. Geographic convergence is apparent most clearly on the Web, where news providers are both everywhere and nowhere. Anyone can compete for audiences, no matter where the news provider is located. *The New York Times* online has a large readership outside the United States; Clarín, a major news service in Argentina, competes directly with American news services on the Web for Hispanic readers in the United States. The BBC and hundreds of news organizations around the world vie for audiences in any part of the world where their streaming services are not censored. The

convergence process, especially business consolidation, has been made possible by changes in government regulation. The Telecommunications Act of 1996 weakened restrictions on conglomerate ownership of media properties. Federal Communications Commission policies in the decades that followed also weakened restrictions on ownership of multiple media in a single market. In television, this led to the disappearance of many independent stations; in radio, it led to the elimination of news operations at many local stations that were owned and operated by conglomerates in other markets. Government regulations in other countries vary widely on the issue of media convergence. In the United Kingdom, for example, there are stricter rules about cross ownership of media in the same market and less media convergence as a result.

Convergence on Social Media

Convergence is a cornerstone of social media. What started as a text-based service for college students to communicate with friends, evolved into social media based on audio and video as well as services that morphed text into multimedia formats. In addition, a broad range of information/news providers adopted social media, including news organizations, entertainment companies, corporations, government agencies, and individuals.

Business consolidation of social media is dominated by technology corporations, for example, Facebook's acquisition of Instagram, Google's acquisition of YouTube, and Microsoft's acquisition of LinkedIn. Social media companies resist being characterized as media companies—insisting they be thought of as technology platforms. This has helped the industry avoid many government regulations.

The largest social media companies have billions of users. Further, most social media users, especially young people, rely on social media for news, both as a platform for news and links to news organization websites. For news organizations, social media is both an opportunity and a competitor. News organizations can have a presence on many social media sites, including multiple channels on a site and vast archives, but many

other organizations, both legitimate and illicit, compete for those same news consumers.

Social media platforms and their proprietary algorithms control much of what news consumers see. A combination of friends sharing media stories and automated content curation became the “managing editors” for much distribution of news online. Virility, driven by clicks and sharing, is rewarded by social media's algorithms classifying news items as “trending.” As a result, timely and sensational news often does better, regardless of whether it comes from a verifiable media source.

Most American adults get at least some of their news from social media; for some, it is a primary source. The convenience, speed, and interactions with people are considered benefits of social media news consumption. Critics point out that when news distributors operate at scale without adopting established norms, values, and practices of news organizations, they are vulnerable to manipulation and exploitation. Many social media news consumers say they expect the news on social media to be largely inaccurate. Clickbait headlines, fake news, lack of fact-checking, and unreliable sources are leading factors in consumers' low trust of social media news but, in spite of this, many rely on social media for news. Social media has also come at a cost for traditional print news organizations. They have felt a requirement to provide video news stories, which can be very expensive. This practice has been called *pivot to video*. It has drained resources from other news venues such as print, for example, a reduction in print reporters, but often has not yielded enough revenue to offset the costs.

Obstacles and Negative Effects

There are many obstacles to convergence and potentially negative effects. Company culture can create barriers to inter- and intraorganizational cooperation, for example, when a company's newspaper, TV station, and websites operate with different organizational structures and management styles. Economic factors can also be a barrier. Many newspapers have been under financial pressure for years, forced to maintain or increase profits with fewer resources in the form of reporters and technology.

Reporters have mixed attitudes about convergence. Some view themselves as print or broadcast journalists and do not want to create stories for multiple platforms. Others lack the skills or training to create for a medium such as television. Still others are cynical and view convergence as a marketing gimmick or a management ploy to get fewer journalists to do more work and promote the news as a product, not journalism. There are editors and publishers who resist convergence, viewing it as a jargon term with more hype than reality or a code word for technology taking over the newsroom, especially video technology.

Consumer behavior can be a barrier. Consumers have taken to the Web and social media for news in very large numbers, but some do not want to pay for content and others are willing to pay but want to pay less than what they paid in the print era, forcing news organizations into new business models.

Critics of convergence point out that it does not always work, can take a long time to recoup investment costs, and is a reaction to technology change rather than a conscious step forward for journalism. AOL's purchase of Time Warner in 2000 is often cited as an example of convergence that did not work. It represented a clash of organizational cultures, and few of the promised synergies across media groups ever materialized. It has also been argued that large conglomerates offer less diversity of opinions due to the concentration of ownership and a need to convey a consistent brand image across media divisions.

Other critics argue that convergence is about automation of the news production process, leading to fewer reporters and the temptation to lower standards, for example, turning press releases into editorial content because it fills holes in news production, and mixing advertising with content because it increases revenue. It can also lead to the elimination of news programming, for example, the consolidation of radio stations in the 1990s and early 2000s led to a sharp cutback in news coverage—it was deemed too expensive.

The convergence of media in the production and distribution of news content is a well-established reality. In the new media environment, journalists require a broader set of skills. Writing is no less important than in the past, but writing for

multiple media is now a prerequisite for the professional journalist. Convergence has led to more competition as the location of a news organization becomes less important, and media that were separated in the past by their means of distribution (e.g., print and broadcast) now occupy the same space on the Web. CNN, *The Washington Post*, ABC Radio, the BBC, and *Time Magazine* are direct competitors in the Web environment.

The group that may be challenged the most by convergence is local news organizations. They lack the resources of larger news organizations. Also, larger news organizations now compete with local news entities who, lacking sufficient resources to produce large amounts of content for the Web, may cut back on local reporting—their main competitive advantage. This contributed to a sharp decline in the number of local news organizations in the 2000s and 2010s.

The concept of producing and distributing news stories to multiple platforms seems straightforward but it is not. A news organization needs software to manage and distribute stories in different formats, hardware to store files, and budgets that cut across departments and organizations. The assignment editor in a news organization must decide not only what stories to cover but in what formats, where they will be published, and how to cover a story for multiple media.

Convergence also requires a new mindset for journalists. They must think multimedia and plan ahead for repurposing content across different platforms. Many old journalistic instincts are wrong in the new media environment. For example, in a newspaper or television news context, the goal is to attract and keep the reader or viewer. In the Web environment, readers jump around and expect the reporter to be an expert who will not only convey valuable information but will provide links that send the reader to additional sources of information. The consumer of news is also much more active in the converged media environment. Consumers comment about stories and sometimes provide news in the form of photos they submit or news tips they provide. The so-called citizen journalist movement is not without problems. How does a news organization maintain quality, fact check, and avoid outright deception in an era of citizen journalism?

If there is a threat to journalism from the convergence process, it may be the commoditization of news. News organizations are under significant financial pressure to create more news, for more media, with fewer resources. Technology and repurposing stories help them do this, but the question arises as to whether professional reporting could be squeezed out in the process and news quality could be reduced to the point where it is just a commodity like paper towels or soap. The answer is probably no, but the danger exists. If groups such as Google can create news services with no reporters, simply by aggregating or linking to content from other sources, it becomes difficult for news organizations with costly staffs of reporters to compete.

includes trademarks, patents, and trade secrets. This entry examines the origins of copyright as well as related theory and criticism. The entry also discusses copyright law, the fair use doctrine, and legal issues connected to copyright law. The entry concludes with a discussion of copyright within the context of journalism.

Origins

Civilizations dating to ancient Egypt have inscribed unique marks on physical objects, such as bricks, to indicate ownership or craftsmanship. Greeks first used marks to indicate a creator's association with more cerebral products, such as art and literature. Romans further distinguished an author's right of ownership from an alienable right to reproduce a work. Chinese as early as the Han Dynasty (206 B.C.–A.D. 200) recognized an exclusive legal right to reproduce written works. But intellectual property notions in ancient Eastern cultures developed less fully than in the West because Eastern philosophical traditions tended toward more communal than individual notions of knowledge ownership.

In the West, the prominence of medieval guilds led to increased legal recognition and protection for marks that identified goods and services. These marks correlate closely with marks recognized in modern intellectual property law: trademarks, service marks, and certificate marks. Guilds also maintained trade secrets that correlate closely with modern trade secrets, protected by law against theft as long as the owner takes steps to maintain secrecy. The concept of the patent also dawned at this time, as governments sought to attract new scientific methods in the development of public works by offering creators exclusive legal rights in their designs.

With the introduction of movable type in Europe in the mid-15th century, authors and printers joined engineers and traditional guilds in seeking enhanced legal protection for intellectual property. The Republic of Venice became renowned for obliging and attracting intellectual talent. Venice is credited with adoption of the first patent statute in 1474. The British Crown in 1557 provided a royal charter to the Stationers' Company, a powerful printers' guild, granting its members exclusive rights to reproduce written works, thus essentially to oversee a system of copyright.

COPYRIGHT

Copyright is a legal protection of expressions that are fixed in tangible media. Copyright describes, for example, an author's right to reproduce a book manuscript, an artist's right to duplicate his painting, or a musician's right to perform an original score. Copyright is part of a family of legal interests loosely termed *intellectual property*, which also

Governments thus protected intellectual property against piracy and awarded exclusive rights, or privileges, to intellectual property owners to profit from their graphic or mechanical designs and publications.

More definite statutory precursors to modern intellectual property law developed in Britain in the 17th and 18th centuries. The 1623 Statute of Monopolies generally proscribed the monopolization of inventions but operated as a patent law by protecting a creator's interest in an invention for the first 14 years. The 1710 Statute of (Queen) Anne formalized copyright law, superseding the monopoly of the Stationers' Company. The statute established depository libraries for copyrighted works, gave authors a right of reproduction, and allowed them a 14-year term of copyright, renewable by still-living authors for 14 more years.

Following the lead of such 18th-century political philosophers as John Locke (1632–1704), post-revolution governments in the United States and France reenvisioned intellectual property as a natural right, rather than a privilege awarded by government authority. Still, these new governments limited intellectual property rights with statutory terms. The U.S. Constitution of 1787 (Article I, section 8, clause 8) empowered Congress “[to] promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries.” Congress enacted copyright and patent laws in 1790, the former modeled on the Statute of Anne.

Modern American copyright law was inaugurated by the 1909 Copyright Act. It remained in effect, with amendments, until it was superseded by the 1976 Copyright Act, though the former remained in effect for works copyrighted up to 1978. The 1909 act doubled the terms of initial and renewed copyright to 28 years each and required that copyrighted works bear copyright notice—for example, the typographical symbol, “©”—and be registered at the federal Copyright Office. The 1909 act did not preempt state common law copyright, which provided some protection for unpublished works.

The 1976 law did substantially supersede state common law copyright but extended the federal system to protect works from the time they are “fixed in a tangible medium of expression,” thus

encompassing unpublished works. The 1976 act further extended the term of protection to the life of the author plus 50 years. The 1976 act still required notice and registration of a copyright before the owner could employ the enforcement provisions of the law, but defects of process were no longer necessarily fatal to later copyright claims.

U.S. copyright law was amended in 1988 to effect U.S. accession to the Berne Convention for the Protection of Literary and Artistic Works, a multilateral agreement dating to 1886 that requires nations to recognize one another's copyrights. The 1988 amendments also relaxed procedural formalities of U.S. copyright, notably the requirements of notice and registration as conditions of enforcement. Congress implemented other international agreements on copyright by enacting the Digital Millennium Copyright Act of 1998 (DMCA), which in part prohibited the circumvention of technology designed to thwart piracy of copyrighted electronic content, such as motion pictures on compact discs. Also, in 1998, Congress extended the term of U.S. copyright to life of the author plus 70 years, and corporate copyright to the lesser of 95 years from publication or 120 years from creation. The U.S. Supreme Court has deferred to Congress on copyright term extension and even the restoration of copyright protection of works that had fallen into the public domain.

Copyright law in the United States and around the world has been amended to conform to the international Agreement on Trade-Related Aspects of Intellectual Property Rights, or TRIPS, which built on the Berne Convention and established the World Trade Organization (WTO) in 1995. TRIPS provides copyright protection to computer software and limited protection to data compilations. In addition to the WTO, the World Intellectual Property Organization of the United Nations is an influential intergovernmental body in the harmonization of global copyright.

Theory and Criticism

Like other intellectual property interests, copyright reflects a fundamental tension between the public's interest in shared knowledge and free-market trade, on the one hand, and private property rights and the public's interest in encouraging

innovation, on the other. On the former score, society has an interest in the exchange of information free of legal restriction so as to facilitate the collective attainment of desirable norms such as truth and equality. The free market also depends in part on a free exchange of information, as actors in a marketplace who are better informed are more likely to make rational decisions that maximize productivity and efficiency.

Critics of these justifications for copyright argue, for example, that excessively long copyright terms unjustly enrich content creators and stifle creative expression that might otherwise emerge. Critics charge that affording creators too broad a spectrum of copyright protection contorts free market dynamics; for example, the anticircumvention provision of the DMCA arguably inhibits development of content-delivery technologies more efficient than what the market offers.

Copyright is understood as an expression of natural rights, which posits that a creator of intellectual property enjoys a unique relationship with the creation; accordingly, respect for the creator demands that he or she be afforded control over the disposition of the creation. The creation is therefore given the legal status of private property with rights of ownership vested in the creator. This arrangement serves the public interest both because it protects natural rights and because it fosters creation of new intellectual property. Authors and artists who know that they will be permitted to profit from their creations are more likely to create again. Historically, this latter concept, termed *incentive theory*, has been important in U.S. law, while the natural rights approach has been of foremost importance in European law.

Because the Internet is an unprecedented medium for the global and nearly instantaneous exchange of content, and by its nature the Internet tends to defy the legal constraints of national laws, it has become a battleground for government regulators, content owners, open-knowledge advocates, and intellectual-property pirates.

Contemporary Law

By statute, U.S. copyright law protects “original works of authorship fixed in any tangible medium of expression . . . from which they can be perceived, reproduced, or otherwise communicated,

either directly or with the aid of a machine or device.” Original works include the literary (which simply means written or printed—this is not a term denoting any minimal level of quality), musical, dramatic, choreographic, pictorial, graphic, sculptural, audiovisual, and architectural. While copyright protects the expression of ideas, it does not protect ideas themselves. Thus for example, a description of a new accounting method may be copyrighted, but the method itself may not be, and may be described in other words by someone else. Short names, representative symbols, processes, and inventions are not copyrighted but may be eligible for trademark or patent protection.

A constitutionally required element of a copyrightable work is originality. That means that the work must have been created independently by the copyright holder and that the work must embody some minimum of creativity. For example, an author who writes a sequel to a classic literary work may copyright the new, independent creation, but not the preexisting classic. A publisher of calendars may copyright an arrangement of photographs but may not copyright the ordinary arrangement of dates in a seven-column table.

Generally, a copyright owner enjoys the exclusive legal right to reproduce a work, to prepare work that is derivative of an original, to distribute copies, to perform or display a work, to broadcast a sound recording, or to authorize another to exercise the owner’s rights.

Copyright is subject to many limitations. For example, a public library may duplicate the contents of a book threatened by physical decay. A system of compulsory licensing authorizes musical groups to “cover” popular songs. Some statutory limitations on copyright are so complex in their interpretation and application, and the demand to use copyrighted content so high, that *de facto* licensing authorities have arisen. For example, the nonprofit American Society of Composers, Authors and Publishers is one of several organizations that manages royalties for music performance and broadcast. Pursuant to the Music Modernization Act of 2018, the nonprofit SoundExchange collects royalties on streaming digital music. The for-profit Copyright Clearance Center handles licensing for many written works in the United States and has sister organizations around the world.

Fair Use Doctrine

An important limitation on copyright is the fair use doctrine. The doctrine was developed by the courts and expressly incorporated into law with the 1976 Copyright Act. A problem of copyright is that an exclusive right vested in one owner is at odds with the freedom of expression enjoyed by all other persons. Indeed, copyright is at some point at odds with itself, as an excessively protective regime would choke off the very creative expression that copyright is designed to foster. Fair use means to balance these competing interests by allowing limited though unauthorized use of copyrighted works.

Fair use is determined by a four-factor analysis. The first factor considers the purpose and character of the use. Noncommercial use, such as an educator using copyrighted material in class or a journalist using copyrighted material in a news story, is preferred to commercial use. A transformative use, when the user has a different purpose from the creator's and the use is not a substitute for the original, favors a determination of fair use. For example, copyrighted photographs might be repurposed as artwork within a creative collage. Courts have held increasingly that contextual changes may effect transformative use even when material is copied fully. In this vein, courts have allowed digital library projects to scan copyrighted texts into databases to facilitate research, preservation, and access for people with disabilities.

The second fair use factor considers the nature of the copyrighted work. Works with more original creative content, such as a wholly original fantasy novel, are entitled to greater protection than works of less originality, such as the fact-intensive contents of an almanac. The third fair use factor is the amount and substantiality of the use relative to the whole of the copyrighted work. A reproduced page of a medical treatise is less likely infringing than a reproduced chapter. The fourth fair use factor concerns the effect of the use on the market value of the original. Reproduction of the climactic scene of a suspense film may well infringe copyright if it depresses consumer demand for tickets.

Application of fair use doctrine is often at the heart of legal disputes over copyright. Flexibility

of the four factors means that case outcomes are difficult to predict, and unpredictability promotes litigation. At the same time, a vigorous fair use doctrine offers essential breathing room for free expression.

Issues

Copyright law has given rise to myriad legal issues and its own subspecialty of legal practice. Key issues in modern copyright have been protection for data compilations, parody as fair use, and copyright enforcement online. Copyright issues intersect at the problem of Internet memes.

A first copyright issue is protection of data compilations. A landmark copyright dispute over telephone books reinforced the originality prerequisite of copyright and disallowed protection of mere data. In *Feist Publications, Inc. v. Rural Telephone Service Co.* (1991), a telephone cooperative sued a telephone book publisher for copyright infringement in the unauthorized extraction of compiled listings. The U.S. Supreme Court ruled that no infringement had occurred because a data compilation, while generated by "the sweat of the brow" of the compiler, lacks the minimal originality required for copyright protection. Creative choices, such as the arrangement of data in presentation, or the selection of data for inclusion, may merit copyright protection, but the data themselves do not.

Rejection of "sweat of the brow" copyright in the United States differs from its acceptance in Europe. In 1996, the European Community protected database content as well as data selection and arrangement. International application turns on reciprocity, so only databases from participating countries are protected. The desirability of database protection and the market consequences of its absence have spurred lobbying and litigation by the U.S. information industry, as yet to little avail. Responding to industry pressure, the TRIPS Agreement explicitly protects selection and arrangement but not underlying data themselves.

A second copyright issue is parody. Communication of parody depends on its resemblance to the original, so a vital parody market requires a tolerant copyright regime. Recognizing this problem and the importance of parody to social and political criticism, the U.S. Supreme Court built parody

protection into the fair use regime in *Campbell v. Acuff-Rose Music, Inc.* (1994). In *Campbell*, the rap music group 2 Live Crew had produced an unauthorized and commercially lucrative parody of the copyrighted Roy Orbison song, “Oh, Pretty Woman,” borrowing an opening riff and lyrics, but little more. The Court found that 2 Live Crew’s taking from the original was not excessive considering the nature of parody, which must contain enough of the original to conjure it in the mind of the listener. The Court’s fair use analysis cut a wide path for parody, recognizing, for example, that a parody’s commercial success does not necessarily degrade the market for the original, and might even enhance it.

A third copyright issue is online enforcement. The Internet has vastly enhanced the ease with which a user can copy and republish copyrighted content en masse without diminished quality. Meanwhile, rightsholders have found online enforcement prohibitively burdensome for many reasons: the technical difficulty of identifying infringers, the legal challenges of transnational enforcement, the costs of innumerable enforcement actions, and the public relations of pursuing individuals. Consequently, rightsholders have sought legal means to enforce copyright against electronic intermediaries, such as software developers and Internet service providers (ISPs), whose work product makes infringement possible. In 2005, the U.S. Supreme Court held unanimously that distributors of peer-to-peer file sharing software could be held liable for encouraging copyright-infringing uses of their products.

But rightsholders have had difficulty pushing past plain facilitation of infringement to reach ISPs, such as social media platforms and the popular Google video platform, YouTube. The DMCA created a “notice and takedown” regime, emulated by European legislation in 2000. Notice and takedown affords an ISP safe harbor against copyright enforcement for the unwitting storage and republication of protected material, provided that the ISP takes down the material upon receiving notice of infringement.

Notice and takedown proved effective, if arguably too effective. Critics charge that ISPs acceded automatically to notice letters without questioning their assertions, empowering rightsholders to suppress noninfringing fair uses. Rightsholders

meanwhile complain that enforcement is still a game of whack-a-mole and that ISPs feign ignorance of user infringement while profiting from it. Responding to rightsholders’ pleas, in 2011, a U.S.-negotiated treaty and two bills in Congress sought to step up online enforcement with strong-arm tactics including criminalizing infringing streams, blocking providers’ financial transactions, and shuttering websites. The treaty and bills prompted unprecedented global protests, and world leaders and U.S. lawmakers backed down.

Nevertheless, rightsholders have continued to press for systematic copyright enforcement through intermediary responsibility. Copyright enforcement provisions were part of the failed Trans-Pacific Partnership trade agreement in 2016. With its 2019 copyright directive, Europe moved away from notice and takedown, calling for national legislation that would require ISPs to filter user uploads for copyright-infringing content. Lobbyists have pressed U.S. lawmakers for comparable compulsion.

The problem of Internet memes arises at the intersection of parody and enforcement. In memes, Internet users combine text and visual imagery to effect social commentary. Internet memes tend to propagate virally online regardless of copyright, often to the displeasure of rightsholders. For example, cartoonist Matt Furie saw his famously easygoing Pepe the Frog character, in 2016, retweeted in support of the Trump presidential campaign, and, later, appropriated as a symbol of white nationalism. The prospect of upload filtering raises concern over the suppression of memes, especially when they are used in politics.

While some memes openly appropriate copyrighted content, inviting only fair use as an arguable defense, others test the threshold of copyrightability. Multiplayer online games incorporate “dance emotes,” options that allow players’ avatars to express emotion by dancing. In 2019, actor Alfonso Ribeiro sued Epic Games, alleging that emotes in the popular game Fortnite appropriated plaintiffs’ dance moves. Ribeiro created the eponymous Carlton dance for a sit-com character in the 1990s. Memes have long used audiovisual representations of Ribeiro as Carlton, disregarding copyright. Epic’s use raises the question whether dance moves may be copyrighted when divorced from the dancer’s own representation. Like parody,

dance moves evoke the original in the mind of the viewer. But experts have opined that dance moves alone fall too far short of a complete choreographic work to merit copyright protection. Whatever the outcome in the suit, the case foreshadows other copyright problems that are likely to arise from the ever-increasing capacity of computer-generated imagery to simulate the real world.

Journalism and Copyright

Copyright is essential to journalism, as the journalist trades on proprietary expression. A journalist's work is copyrighted when it is fixed in an article or broadcast story. Under copyright's "work for hire" doctrine, copyright vests in an employer-publisher, not in an employee-writer, unless the parties agree otherwise.

A dispute has smoldered for more than a century over the copyrightability of news itself. Copyright plainly applies to news stories, as fixed expressions, but cannot apply to the underlying facts of the news. Thus, news may be repackaged and republished in new stories without violating copyright. However, there are only so many ways to write a headline or lead with an economy of words. Repetition is inevitable, prompting difficult questions as to when news extracts are imbued with the minimum of originality to warrant copyright protection, and when taking exceeds fair use. American courts have tended to reject copyright in mere headlines and short news extracts.

Adding to confusion over news copyright, the U.S. Supreme Court in 1918 held that despite federal copyright's inapplicability, an action may lie in state misappropriation law when one news service pirates the scoop of a competitor. The viability of this "hot news doctrine" has been questioned since the preemption of state common law by the 1976 Copyright Act. Federal courts have consistently reaffirmed the doctrine but have narrowed it in application. In 1997, a court found no misappropriation in a pager service that transmitted real-time sport scores because the service expended resources to ascertain the information and did not "free ride" on the work of the sporting-association rightsholder. In 2011, a court found no misappropriation in a website's reiteration of a bank's investment recommendations because the website was

reporting the recommendations as news, not passing them off as its own.

Online news aggregation and technological features of the Internet have aggravated tensions over news copyright. The hostility of U.S. courts to the assertion of copyright in facts, rather than creative expression about facts, and the courts' liberal approach to fair use have combined favorably for defendants accused of infringement. Characteristically, in 2007, a court found no copyright violation in framing and embedding copyrighted content and applied transformative use doctrine to allow informational and retail use of thumbnail images linked to rightsholders' full-size originals.

At first blush, this trend against news copyright seems to favor free speech. At the same time, advocates for journalism in the public interest blame liberal copyright doctrine for facilitating the collapse of journalism as a viable business model. Displaying advertising alongside extracted and embedded content, search engines and news aggregators profit without paying for the content that drives users to their sites. Journalism advocates have posited that a system such as the compulsory licensing of music for broadcast or streaming could achieve equity and restore public interest journalism to profitability.

That theory animated the authorization of a "link tax," or "snippet tax," in the 2019 EU copyright directive. The first country to legislate pursuant to the directive, France in 2019, ordered search engine and aggregator Google to pay news publishers for using snippets of their content. Google responded by pledging to redact snippets from search results in France. The country and company are at a stalemate as of 2021.

Copyright is a delicate instrument of public policy. Properly designed, it simultaneously fosters and inhibits freedom of expression. Accordingly, journalism depends on copyright to ensure both protection for work product and a free speech market. Financial, technological, and cultural changes pose ever greater challenges to courts and policymakers to keep copyright working.

CORRECTIONS POLICIES

In journalism, a correction is the notice that a news outlet provides to its audience of mistakes in published or posted content. Reporters and editors identify or are informed about errors and then follow their organization's policy—an adopted newsroom practice typically found in its codes of conduct—in correcting published, posted, or broadcast content. Reputations of news organizations rely on truthful reports, so factual accuracy is paramount. Otherwise, journalism may be perceived as misleading the audience, prompting people to turn to other sources of information that may be tainted by self-interest rather than public interest. In this entry, the history and ethics of corrections policies in U.S. news organizations are explored, with discussion of policies and procedures in place at different types of news outlets. The entry concludes by discussing some of the challenges of correcting errors in the 21st century and recommendations that have been made for improving corrections policies.

Some journalism mistakes are so egregious that they make rather than document history. The 1948 presidential election featured New York Gov. Thomas Dewey, a Republican, against President Harry S. Truman, a Democrat. On November 3, the *Chicago Daily Tribune* carried this erroneous headline: DEWEY DEFEATS TRUMAN. In actuality, Truman had won the election. The *Tribune* blamed polls that predicted an easy Dewey win. At the time, there was a printer's strike that forced the newspaper to go to press earlier than usual, prompting then managing editor J. Loy "Pat" Maloney to call the election before East Coast results were tallied. The mistake was immortalized in media history when Truman was photographed holding up a copy of the first edition with the infamous Dewey headline. Some 150,000 copies of the newspaper were printed before the error was corrected in the second edition.

In the United States, the idea that news organizations have a responsibility to inform the citizenry can be traced to 1690 in the first colonial American newspaper, *Publick Occurrences: Both Forreign and Domestick*. Benjamin Harris, printer, stated that he would publish “what we have reason to believe is true,” adding “when there appears any material mistake . . . it shall be corrected” (DiBacco, 2015). The Massachusetts Bay Colony, concerned that officials would be held accountable, shut down his paper after the first edition, requiring similar publications to be licensed before disseminating and distributing content.

A generation later, in 1733, John Peter Zenger published a report in the *New York Weekly Journal*, accusing royal Gov. William S. Crosby of rigging elections. Zenger was arrested and accused of seditious libel or content that challenged the authority of the state. The case helped to establish a precedent for the development of subsequent corrections policies inasmuch as it upheld accurate reporting as a defense against claims of libel. At the time, English courts elevated authority over truth, believing the greater the truth, the greater the libel. Defense attorney Andrew Hamilton successfully argued for “the liberty both of exposing and opposing arbitrary power by speaking and writing truth” (Walker, p. 111). The John Peter Zenger case elevated factual truth over royal authority, setting the stage for the American Revolution as well as setting the standards for accurate journalism.

Accountability

The ethical principle associated with corrections is accountability. It ensures credibility. Fallibility is common in every institution or organization but those whose mission is associated with credibility have an obligation to be accountable to the publics they serve. Devising accountability policies and standards that address mistakes and errors not only enhances credibility but also reaffirms quality and reputation while reducing the likelihood of future mistakes.

Humans make mistakes. Reporters make mistakes every day. They may misspell a name, cite the wrong address, misquote a source, or otherwise misrepresent key attributes of a story. Sometimes, reviewing their posted or published work, the

reporter catches the mistake. Sometimes readers, viewers, or even colleagues in the same newsroom identify the error and bring it to the reporter’s attention. Increasingly, online fact-checking organizations may dispute a published report or claim made by a source or company. A study by Michelle Amazeen and colleagues noted that fact-checking entities and websites have increased substantially since 2001, analyzing what sources claim in political stories as well as what companies do in marketing and advertising campaigns.

Policies and Procedures

Once an error is detected, reporters are expected to follow newsroom policy and correct the error. At *The New York Times*, correcting mistakes is an ongoing process with a website updated daily. In a 2018 essay, *New York Times* corrections editor Rogene Jacquette wrote that the newspaper’s goal is to provide the highest quality journalism possible by telling the audience the truth in a factual manner, adhering to a standard that recognizes an ethical responsibility to correct all errors, no matter how large or small, in a timely manner and prominent place reserved for that purpose.

The New York Times correction policy also includes instructions on how reporters, editors, and producers should:

- Strive for accurate and complete stories.
- Do so in clear, understandable language, explaining what was wrong.
- Update digital reports, inserting a note that a story has been updated with corrected information.
- Clarify when a report is factually correct but poorly expressed, requiring revision.
- Create an editorial note when a correction raises significant ethical issues or fails to meet editorial standards.

Corrections need to be made in a timely, prominent manner. Prominence is associated with placement of corrections in a section, web page, or portion of a broadcast report that readers, listeners, and viewers can easily locate. Without specifying how prominence should be defined in broadcast reports, the Radio Television Digital News Association states, “Ethical journalism requires owning

errors, correcting them promptly and giving corrections as much prominence as the error itself had” (RTDNA, 2015). Placement in print typically is in the same section of a newspaper or magazine where the original error occurred or in a specific page where the audience can find it.

Some who work in U.S. print media maintain that a correction should be given the same treatment and prominence as the original flawed article. Craig Silverman, who has written extensively about news media errors and accountability, argues the same principle should apply to the web. The issue there, however, differs from static print; the web is fast and fluid. The Online News Association acknowledges this, noting many print publications “believe a correction should be at least referenced where it first appeared. . . . Rules for how to correct errors in online news are less clear” (ONA, n.d.).

The issue of “timely” also has changed in the Internet era. Typically, timely meant the next issue of a printed publication, such as a newspaper or magazine, or the next news cycle in television or radio. Now all those platforms have websites where corrections can be made within a short time following the discovery of an error. This aspect of corrections provides for more transparency, increasing trust and credibility.

The Washington Post’s corrections policy makes a distinction between updating an online story as events occur and new information is learned and updating the story because of an error that requires notice to readers. The policy states “*It is necessary* to use a correction, clarification or editor’s note to inform readers whenever we correct a significant mistake” (Washington Post Staff, 2016). Serious errors at *The Washington Post* may require an editor’s note with an explanation of how the mistake may have happened.

A 2007 study by Michael Bugeja found that policies of news media companies on what should be included in a published or broadcast correction vary from company to company. Drawing from multiple studies, Bugeja (2007) identified the following as key components of correcting a news story:

1. Identify the error (what it was, when and where it occurred).
2. Correct the record.
3. Do so as soon as possible.
4. Do so prominently.
5. Provide an explanation to the audience or clientele.
6. Disclose how the error could have been avoided and/or how it will be prevented in the future.
7. Issue an apology to those damaged by the false disclosure (p. 50).

Many published corrections omit one or more items from this list, as there is no uniform standard on how to deal with errors. In the end, readers, listeners, and viewers expect that corrections contain genuine expressions of regret rather than justification or excuse-making whose intent might appear to absolve the corporation from liability rather than resolve the issue at hand.

Challenges and Recommendations

The Internet has brought challenges to traditional practices of correcting the record. Social media users routinely share or discuss flawed content without regard to the consequences of inaccuracy. This effect may be associated with differences in standards between traditional and digital media. For instance, traditional print outlets value such tenets as balance, impartiality, gatekeeping, and prepublication verification, whereas digital products often emphasize immediacy, transparency, partiality, and postpublication correction. The nature of digital content is its speed, which distributes mistakes instantaneously and globally.

The interface with social media further disrupts the conventional process of correcting errors. An initial mistake in a report may be shared thousands of times before a correction appears online. In the interim, viewers may have seized upon the initial error in posts, links, and comments, sparking charges that the report was intended to deceive. Moreover, rumors abound on social media. There are few guidelines on how to deal with rumors while upholding conventional values of accuracy, verification, and transparency. However, some newspapers are utilizing social media monitoring tools and are able to see who or what has redistributed content. Using those applications, reporters, editors, and producers can contact top sharers of content and inform them about updated, accurate reports.

The Knight Commission on Trust, Media and Democracy's 2019 report, *Crisis in Democracy: Renewing Trust in America*, outlined several best practice recommendations for media outlets to restore trust in media and regain credibility. Among the recommendations were:

- Processes to correct errors should be simplified.
- News organizations should make it simpler for the public to report errors.
- More resources should be allotted for staff to respond to requests for corrections.
- Technology should be developed to track the same digital paths that erroneous content traveled, correcting the record along the way.
- Policies should be updated to address new methods of content creation, including corrections in podcasts, voice-activated devices, virtual reality, and augmented reality.

Policies will continue to evolve as platforms become more interactive and algorithmic. Ethicists are concerned that erroneous content from robot journalists could tarnish newsroom reputations, especially when a mistake rises to the level of libel litigation. Questions concern how the courts would assess who or what might be responsible for faulty algorithms or other flaws in system design and whether a robot was negligent or malicious when disseminating libelous content damaging individuals or organizations. Conversely, executives at news organizations using artificial intelligence say they are using robots to report more mundane content, giving human journalists more time to create accurate reports on substantial issues.

CREDIBILITY

The credibility of news, and people's willingness to learn from it and act on it as if it were true, has emerged as a major issue in contemporary American and world society. The willingness of some individuals or groups to accept as credible information that others reject as propaganda or disinformation is emerging as a significant barrier to the governance of nations, including the United States. This lack of uniformity suggests a problem with media literacy and to some extent cultural and institutional discontinuities that have badly divided politics and the larger society in the age of social media.

This manifests in the rapid spread of so-called fake news that is written with the intent to deceive, the inability of some to tell the difference between fake news and credible news, acceptance or even

preference for propaganda over more balanced information, and the propagation of hate speech and various forms of misinformation. All of this together signals significant dysfunction and public confusion about the credibility of information. Difficulty assessing media credibility interferes with the ability to communicate with one another accurately and responsibly and for the public to make accurate judgments about matters of public policy, make assessments of their elected officials, and decide how to vote.

Acceptance of various forms of misinformation has emerged as a recognizable problem that requires significant research attention. What is needed is not only a clear understanding of what people misunderstand, but also why, and how this can be addressed by policy makers. The World Economic Forum, which meets annually at Davos, Switzerland, warned of the problem of misinformation in their 2013 report, *Digital Wildfires in a Hyperconnected World*. The World Economic Forum warned that misuse of hyperconnectivity characterizes the contemporary world and that misguided attempts to prevent such outcomes can also pose great danger to governance and society. This entry further discusses the importance of credibility in journalism. It then looks at how people assess the credibility of media they consume, the challenges presented by the loss of local news sources in the United States, and efforts to support local news producers and improve journalism quality.

When a government institutes a new policy, the news media are among the most important venues where citizens can learn about what is planned, how it will affect them, what it will cost, and so forth. In 2010 the United States Congress approved the Patient Protection and Affordable Care Act (ACA) that aimed to build on the existing private health insurance systems operating in the United States, as well as certain government programs such as Medicaid, to attempt to cover each person with comprehensive health insurance. Medicaid is a federal and state partnership that helps pay for medical treatment for certain people with limited incomes.

The ACA was considered the signature legislative achievement of the Obama presidency and was passed without Republican votes, making everything about it politically contentious. News

focused on the chances of passage and the polling about its level of public support. Even after the law was passed, confusion, reigned over what it would cover. Political opponents spread myths of the law setting up “death panels” that would determine whether older people could receive treatment for certain diseases under the law. Others suggested that undocumented persons would be eligible for benefits when in fact they were banned from receiving benefits. Politicians opposed to the ACA have run ads against it in subsequent Congressional races and during the 2016 presidential election, often spreading false or misleading information.

A 2015 study that examined public perceptions of the ACA attempted to distinguish between ignorance (lacking a correct belief about an issue) and misperception (holding an incorrect belief with confidence). As the study’s authors, Josh Pasek and colleagues, note: “Whereas ignorance is lamentable in a democracy, misperceptions have the potential to be dangerous” (Pasek et al., 2015, p. 660). Their study found that incorrect answers to questions about the ACA were far more common than confidently held incorrect beliefs. The confidently held misperceptions were most common about parts of the law about which opponents had spread false information. Accurate information, when widely spread through the population, helped people hold correct beliefs with confidence.

A similar pattern of misperceptions can be found on a range of other important issues in the United States, including public understanding of terrorism, claims about weapons of mass destruction in Iraq made prior to the Iraq War (2003-2011), and the economic effects of the Tax Cut and Jobs Act of 2017. These perceptions and misperceptions built up in nonelection contexts are very influential in shaping the election discourse and political judgments.

Mainstream empirical research in communication suggests that social media’s effects in U.S. national elections of 2012 and 2016 were small and limited. However, detailed studies indicate that weaponized use of social media, combined with “hacking and dumping” information, that is, selectively releasing damaging and divisive information to affect public opinion and possibly change election outcomes, underlines the

importance of these issues and suggests that information effects can be quite powerful. People seem to select media, in part, on identity cues from those media that reflect their individual and group identities.

Changes in the media system and the ways various subgroups in the population use them may contribute to conditions that facilitate misinformation. People’s use of media and information are changing rapidly as technology advances and media literacy lags. One important trend is the increasing reliance of many people on social media as a trusted source of news. Social media pass along articles from reputable and disreputable news organizations along with a great deal of user-generated content. Social media also contain entertainment content related to the news, and the growing number of satirical news sites and a proliferation of new sources and commentary may outstrip some people’s ability to form critical judgments about the quality of such material.

A study published in 2018 by NORC, a social research organization at the University of Chicago, examined two important heuristics that shape credibility judgments of social media: the trustworthiness of the person sharing the story and the credibility of the news outlet reporting the story. Results strongly favor the interpretation that people are more likely to trust and engage with social media information shared by people they trust than if it is shared by someone they don’t trust. Thus, the sharer is far more important than the source of the content, although the source is important in terms of people’s engagement with the information.

These factors suggest that there is an important role for motivated reasoning in the assessing and using media credibility judgments in everyday life for many people. Motivated reasoning is a psychological theory that suggests that information choice and evaluation, and resulting attitude formation, judgment, or decision making, are influenced by one’s motives or goals. These goals may be ideological or rooted in the desire to be consistent or correct according to some predetermined set of ideas or commitments.

Another dimension of the credibility crisis examines the increased use of digital platforms for disseminating news, including social media, which has radically changed the media universe and has

undermined the advertiser- and subscriber-based funding models that have supported many media for decades. This has led to considerable disruption, particularly in local media, trends that have created what researcher Penelope Abernathy has found are vast “news deserts” throughout parts of the United States once served by community newspapers.

As newspapers have traditionally been the largest producer of local news, when they close or consolidate due to ownership changes, it becomes more difficult for people to understand the problems and needs of their local communities. The political content that some cable news provides seems to give one-size-fits-all ideological solutions (e.g., the desirability of small government and low taxes) to governance that might or might not be appropriate for the special problems encountered by highly diverse local conditions.

Exposure to a diversity of media content is a bedrock principle of democratic society and has come under tremendous challenge in recent years due to shifting changes in the technology. The rise of search engines, recommending algorithms, and reliance on social networks put people in new, vastly more complex information environments than the traditional ones to which older generations have become accustomed. In addition, people may have significant problems with media literacy, that is, understanding the strengths and limitations of these commonly used venues.

In light of these problems, a number of organizations have emerged to support local news producers, including U.S. organizations such as the Local News Initiative at Northwestern University, The Maynard Institute, Institute for Nonprofit News, and Report for America, among others. United for News is a project associated with the World Economic Forum that largely works to improve journalism quality and independence internationally. The Gates Foundation has been particularly active in its calls for scholars to counter misinformation campaigns.

CRIMINAL JUSTICE AND JOURNALISM

Coverage of crime and the court system dominates local news in all forms of media and makes up a significant portion of national news in the United States. There is even a cable news network, Court TV, devoted to coverage of major trials. For many Americans, mass-mediated forms of information, either through fiction shows or the news, are the main source of information about crime and the courts.

Because the right of a free press under the First Amendment and right to a fair trial under the Sixth Amendment of the U.S. Constitution are often in direct conflict, a balance is constantly negotiated to ensure protection of both of these rights to the best extent possible. This entry first discusses how news coverage can influence perceptions of suspects and the legal system in the United States. The entry then looks at restrictions set by courts and voluntary guidelines followed by the legal system and the news media to balance the constitutional rights of individuals and news organizations.

Polls show that the public forms opinions about crime from what they see or read in the news much more than from personal experience. A host of studies have shown that subjects exposed to pretrial publicity were significantly more likely to assess guilt to the defendant than those who did not see the media coverage. The majority of studies showed that the bias remained after the deliberation and final verdict. In fact, they found that this bias was strongest when subjects were tested before the trial, which is a dismal testimony to the premise of innocent until proven guilty. Yet media accounts also can convince

people of an accused person's innocence, or at least raise questions in their minds about whether the accusations are justified.

The hit podcast, *Serial*, aided in granting a second look at the case of Adnan Syed, a convicted murderer. In its first season in 2014, the podcast unearthed new evidence in the case through interviews with a variety of people who knew Syed, as well as interviews with the convicted murderer himself. The reporting and popularity of the show prompted a hearing for a new trial that was later denied in the Maryland courts. Similarly, doubts were raised about a murder conviction in the Netflix docuseries, *Making A Murderer* (2015–). After its release, courts reexamined some of the charges under question, and the case garnered 500,000 signatures to petition the White House.

Other studies examine how peoples' physical characteristics can affect judgments of people. Jury research looks at extralegal bias—those biases based on factors that are not supposed to be considered during a trial. Several studies have shown that mock jurors judge attractive defendants more leniently than unattractive ones during sentencing. Race also has been shown to affect perceptions of the accused and the impact on jury decisions and sentencing. White jurors rate Black defendants guilty more often than white defendants in murder cases. Black defendants are found guilty more often when the victim is white. Also, minority defendants who are convicted for the rape and murder of white victims are more likely to receive the death penalty than white or Black perpetrators who have harmed Black victims.

Court Restrictions

As a result of the perceived problems with bias from pretrial coverage, the courts have instituted some ways to combat the prejudice. This prejudice is significant because it implicates both the First Amendment rights of the press and the Sixth Amendment rights of the defendant to a fair and speedy trial.

A case more than a century ago provides a stellar example of these rights in conflict. When Marilyn Sheppard was stabbed to death in her home, front-page headlines splashed the gory details of the murder. Each day, local and national newspapers delivered inflammatory revelations, including

the fact that Marilyn Sheppard's husband was a prime suspect. The husband, neurosurgeon Sam Sheppard, was eventually charged and convicted of murder. Twelve years and numerous appeals later, the U.S. Supreme Court overturned Sheppard's murder conviction because it said he had been denied the right to a fair trial as a result of pretrial publicity.

Following this ruling, in 1968, the American Bar Association proposed routine use of restrictive orders—more commonly called *gag orders*—to control the potential negative effects of press coverage. For the next decade, key players in the trial were regularly silenced. This practice, however, was not tolerated for long. In 1968, the American Newspaper Publishers Association argued that press coverage enables fair trials rather than hindering them. It argued that reporters must have full access to court proceedings so that the public can make informed judgments about the justice system. The Supreme Court agreed and in the 1976 case *Nebraska Press Association v. Stuart* the Court sharply limited restrictive orders on the press and said gag orders on the media should be a last resort in high-profile cases when release of the information will create a clear and present danger to the conduct of a fair trial and when no other remedies could offset the effects of negative publicity.

News media still cover high-profile cases before and during court proceedings. A clear example was Casey Anthony, a mother charged with first-degree murder after the discovery of her baby daughter's remains in a wooded area near her home. Widespread coverage and opinion circulated years before her trial began, giving the public access to a wealth of information about the Anthony case before jury selection. Once the trial was underway, it also served as boon for the news business. Cable channel HLN's relentless coverage of the trial led to the best ratings in its then 29-year history, as millions watched host Nancy Grace excoriate Anthony day after day, and refer to her as "Tot Mom." The trial became such a spectacle that people gathered in bars and restaurants to watch as Anthony was acquitted of murder but found guilty of several misdemeanor offenses and released for time served.

Similarly, in the case of the *State of Florida v. Zimmerman*—where a white neighborhood watch

volunteer was charged with second-degree murder for killing an unarmed Black teenager—media outlets circulated the same few pictures showing the deceased teen, Trayvon Martin, wearing a hooded sweatshirt and a headshot of George Zimmerman wearing a suit and tie, as well as pictures of Zimmerman's mugshot and childhood photos of Trayvon Martin. These pictures were splashed across newspapers, social media, and television leading up to the trial and throughout its duration, and again, the case attracted huge viewership. Coverage reached well into the millions, even catching the attention of then U.S. President, Barack Obama, who later gave official remarks following the not guilty verdict saying, "Trayvon Martin could have been me 35 years ago" (White House, 2013).

Self-Regulation

Even though many attempts to reduce pretrial publicity bias are deemed unconstitutional, two key remedies remain: self-regulation, also called *bench-bar-press guidelines*, and procedural safeguards.

Bench-Bar-Press Guidelines

The American Bar Association formulated bench-bar-press guidelines along with journalists and judges. They offer suggestions for information that police, judges, or lawyers should not release to the press as well as information that the press should not report because it might endanger a defendant's chance for a fair trial. Information about a confession and prior convictions, performance on a lie detector test, or stories about the defendant's character or credibility of witnesses have been flagged as potential problems. Confessions, prior records, and lie detector test results are likely inadmissible in a trial, and prior research has shown these to be the most damaging types of information in pretrial publicity.

The bench-bar-press guidelines are not legally binding but rather merely suggestions for reporters, police officers, judges, and lawyers. However, a classic 1979 study by James W. Tankard, Jr., Kent Middleton, and Tony Rimmer concluded that violations of the ABA guidelines occur more often in states *with* bench-bar-press agreements than in those states that do not have such agreements.

Procedural Safeguards

Another key way to mitigate the effects of pretrial publicity is through procedural safeguards in the courts. Several procedural safeguards are in place to remedy the effects of pretrial publicity such as voir dire, instructions to the jury, the deliberation process, continuance, and change of venue.

Voir dire is the process by which prospective jurors are asked questions under oath to determine whether they are predisposed to a particular outcome. Research on real and mock jurors and juries has found that this process cannot erase the biasing effect of pretrial publicity. However, other studies have shown that the trial process, including voir dire, can lessen the effect of pretrial publicity.

Even with effective voir dire to rule out jurors who are prejudiced before the trial, bias can develop during the trial. A few studies have shown judicial instructions can stop prejudicial perceptions from factoring into decisions. However, a longer line of research reveals the ineffectiveness of jury instructions to disregard inadmissible testimony. As Judge Learned Hand put it in a 1932 ruling in *Nash v. United States*, asking jurors to disregard certain evidence would require “a mental gymnastic which is beyond, not only [a juror’s] power but anybody’s else’s.”

Another safeguard is the deliberation process itself. Many jury studies involve individual mock jurors assessing guilt, while others examine how working in a group, as actual jurors do, can impact these biases. The results are dramatically contradictory. One side argues that the jury deliberation process mitigates the biases exhibited by individual jurors before the trial. The information integration model of jury decision making shows that a juror’s initial perceptions are neutralized by evidence presented in the trial. However, other studies have shown that jury verdicts rarely defer from an individual juror’s initial predeliberation opinions. This suggests the deliberation process does not change opinions of individual jurors. Psychological evidence shows that deliberation tends to *exaggerate* whatever bias individual jurors came in with. Experts have argued that the difference between group and individual decision-making magnifies small biases at the individual level into large ones in the group jury deliberation.

Another possible remedy is to delay the trial until people no longer remember the negative publicity. A 1990 study by Geoffrey P. Kramer, Norbert L. Kerr, and John S. Carroll showed that factual publicity such as a prior record is forgotten when a trial is delayed by 12 days, suggesting that continuance would be an appropriate remedy for this pretrial publicity. However, it should be noted that a continuance would only be effective if there is not a resurgence of the original coverage to re-form the bias in the potential juror’s memory.

CROWDFUNDING

Crowdfunding, as the name suggests, means going to the *crowd* to financially support a project. Typically, this is done using a website or crowdfunding platform on the internet to elicit small amounts of

funds from a large amount of people. Crowdfunding existed before the internet, for example, when public broadcasters and community stations hold telethons where people call in and pledge money. However, while this sort of crowdfunding continues to exist today, crowdfunding over the internet, on crowdfunding platforms, or through an organization's website and social media, is what the term is now associated with. This entry examines crowdfunding platforms, types of crowdfunding, the labor involved in the process, and the connection between crowdfunding and diversity in journalism. The entry concludes with a discussion of journalistic norms and identity.

While crowdfunding has been used to support a wide variety of ventures and product development in the culture industry, from video games to movies, in journalism, crowdfunding has become increasingly popular in the wake of the industry's economic struggles. Since the financial crisis of 2008, news organizations around the world have struggled to make ends meet. This is in part due to falling advertising revenues as advertising migrates to other places on the internet and a decrease in subscriptions as people have become used to getting information on the web for free. As a result, there have been cutbacks and closures, resulting in fewer journalists and fewer news organizations. As one response, both large news organizations and independent journalists have turned to crowdfunding to try to support their journalism. For example, established news organizations, such as *The Guardian* in the United Kingdom, at the end of their articles regularly ask their readers to contribute what they can to support their work. Independent journalists are using crowdfunding platforms such as Kickstarter and Indiegogo to raise funds to start their own small, start-up news organizations. Freelancers looking to publish in legacy media (such as print, television, and radio news organizations) are also using crowdfunding as a way to support their reporting endeavors as freelance budgets at legacy news organizations dry up.

Platforms

Independent journalists and freelancers often use online platforms such as Kickstarter and Indiegogo to crowdfund. Crowdfunding on these

platforms involves creating a *pitch*, describing what the journalist wants to create and why people should fund them. These specific online crowdfunding platforms usually have a fixed deadline for the campaign. Kickstarter, for example, gives journalists 1 month to raise the funds. These online crowdfunding platforms take a percentage of the journalists' earnings. Other journalism organizations set up crowdfunding through their own websites.

Types

Crowdfunding is different from subscribing to a newspaper or magazine, which involves a monthly or yearly payment in order to gain access to the content. With crowdfunding, people are usually donating to support a start-up or one-off individual endeavor or pledging support for content that will be made freely available on a website. There are different types of crowdfunding that differ based on what donors expect for their contributions. Crowdfunding can be equity-based, meaning that people who donate do so with the expectation that they will get a cut of the profits. There is a lending-based model, where money is given and expected to be paid back with interest. There is also donation-based funding, where money is given altruistically without expectation of anything in return. As outlined by Tanja Aitamurto, there are different types of crowdfunding that differ based on what donors expect for their contributions. Generally, journalists who crowdfund use reward-based crowdfunding where the rewards increase in value depending on the amount that is donated. One challenge for journalists is coming up with rewards. When crowdfunding to support a product, such as a video game or a film, often the rewards are a copy of the product itself or affiliated products, such as stickers or T-shirts. However, when crowdfunding for journalism often the product that will be produced will be freely available, as is the case with many news start-ups that have the goal of being open access. Or the story is going to be published elsewhere and cannot be given as a prize. As well, often journalists are unclear at the time of crowdfunding what the product is even going to be; this is especially the case for journalists who are crowdfunding to support freelance work and are not positive

how the story will turn out. In response, journalists have had to get creative. It has become common practice to offer small gifts such as places they are going to if they are raising travel funds for a story, advance copies of their work, behind-the-scenes information on the reporting process. In some cases, for larger donations, journalists have even offered themselves as rewards, offering to go for coffee or drinks with donors, or speak at their events. Because of the difficulties with coming up with suitable rewards, some journalists say they rely less on the rewards as an incentive, and more on altruistic donations, focusing on convincing potential donors that the kind of journalism they are supporting is something that is worth putting their money behind.

Labor

Crowdfunding is often characterized as empowering for both journalists and audiences as it enables journalists to work outside of legacy media, and it allows potential audiences to fund journalism they deem important. However, what is often overlooked in the promise around crowdfunding is that it involves intense labor for journalists, particularly if a journalist is using online platforms such as Kickstarter or Indiegogo. This includes building the pitch and coming up with an outreach strategy. A lot of thought goes into crafting a compelling pitch that will convince people to donate. It is common practice to combine text, visuals, and video in a pitch, which means journalists must have skills in multiple modes of production in addition to promotional writing skills. During the time span of the crowdfunding campaign, there has to be sustained outreach to potential donors. It is not enough to simply put the campaign up and expect people to find it; journalists running the campaigns need to reach out through social media and their offline contacts to bring people to the campaigns. Some journalists find that this part of crowdfunding can amount to a full-time job. Crowdfunding is also a type of labor that many journalists are not used to, as it requires them to be entrepreneurs. Many journalists consider themselves to be public servants, drawn to journalism in order to report on important stories and hold power to account. Crowdfunding requires a different set of entrepreneurial

skills that they may not be used to, which include crafting a pitch that will sell the product, and also promoting and advertising the campaign. For this reason, journalists often work in teams and bring in people who have expertise in marketing to help with the project.

Crowdfunding also changes how journalists work, requiring a type of transparency that is often at odds with how they have usually approached their work. Many journalists are used to keeping a story under wraps until it is published, particularly investigative journalists, for fear that they are scooped by other news outlets. When crowdfunding, journalists have to be very open about the story they are covering if they are freelancing, or the types of stories they will be pursuing if they are creating a news start-up. While many journalists who have worked for legacy media are used to pitching their stories to editors and producers, it is different to pitch one's work to a crowd of strangers and ask them to support the work. However, while some journalists find this a difficult adjustment, there are others who feel it can also be rewarding and helpful to get feedback in advance from potential donors about their work.

Labor and the Audience Commodity

The audience commodity is a theory developed by the Canadian sociologist Dallas Smythe that the real product of media is not the content itself, but the number of people watching the media. These people are then *sold* to companies in the form of ratings, to entice them to advertise. The audience commodity theory argues that audiences are working when watching media, in that they are learning to become consumers by paying attention to the advertisements. This theory is disputed by some who believe that it does not take into account audience agency, and the idea that watching ads can be a source of pleasure and entertainment rather than work. Nonetheless, Smythe's theory of the audience commodity adds another dimension to the discussion of the type of labor that occurs in crowdfunding. Often journalists are using crowdfunding as a way to start a news organization that they then plan to sustain through advertising dollars. In these cases, crowdfunding is seen as a way to get start-up funds, and

the crowdfunding campaign is a way to prove to potential advertisers that they have a built-in audience for this endeavor. Diversity Crowdfunding is often touted as a way to increase diversity in journalism by expanding the types of stories that are told. Journalists crowdfund to create their own independent news outlets that cover stories not told in legacy media. Others are crowdfunding to support their freelance writing to cover stories that have not been told elsewhere. For instance, many journalists are crowdfunding to support news ventures that will cover local news in their areas where news outlets have been closed or cut back. Crowdfunding also increases the number of working journalists, which adds to diversity in the profession's workforce. The work these journalists are doing can be contextualized using the theory of structuration, first coined by the sociologist Anthony Giddens and also used in political economic theory of communication. Structuration theory asks people to look at how society is constrained by social structures as well as how people have individual agency within these structures. These structures can be political or social. In the case of crowdfunding journalists, those who are not able to participate in the structure of legacy media or feel there are stories that are not being covered in this media can be seen as exerting agency when they crowdfund. For example, when students in Canada formed an online magazine called *The Pigeon*, they said they were doing so because they felt that marginalized voices were not being heard in mainstream media and they wanted to create a space for these voices.

Journalistic Norms and Identity

Unlike professions such as medicine and law, where there are exams to pass to enter the profession, journalism does not have set practices. However, norms and standards have developed over the years. In Western journalism, notions of autonomy and independence are key. In newsrooms, this means a separation between the newsroom and advertisers/owners. Journalists refer to an *invisible wall* that exists between the two, meaning that while they might exist in the same space, they are not influenced by advertising and owners. However, in crowdfunding, this wall disappears as journalists must deal with content as

well as the funding. Some journalists who crowdfund do not have any problem with this, as they expect that the people who are funding their journalism believe in the stories that are being reported on and are donating specifically to support this work. Other journalists and journalism organizations that crowdfund are very clear about drawing strict lines between the funding and the content, stating in their campaigns that donors will not have influence over their content. Some journalists who crowdfund who used to work in legacy media bring with them into crowdfunding ideas of objectivity, fairness, and balance that they adhere to in their reporting. However, others are turning to crowdfunding in order to create advocacy journalism where they take a clear stand on an issue or journalism with a point of view where they position themselves in relationship to the story but try to tell many sides.

C-SPAN

C-SPAN, the Cable Satellite Public Affairs Network, is a nonprofit cable network funded entirely by the U.S. cable industry that provides viewers access to the processes of government, in the form of televised sessions of Congress, political events, and other forums where decisions about public policy are made. C-SPAN distinguishes itself from other news outlets by its lack of traditional

reportage. This entry reviews the history of C-SPAN, subject areas of coverage and array of services, and its mission as a neutral conduit of political and public affairs happenings.

C-SPAN: A Brief History

In *The C-SPAN Revolution*, Stephen Frantzich and John Sullivan provide background and the story of televised coverage of the U.S. House of Representatives. The origins of C-SPAN itself date from the late 1970s, when the House of Representatives allowed full television coverage of its sessions in 1977, by a vote of 342 to 44. Thirty years earlier, in 1947, television cameras had recorded the opening of Congress, establishing the first stepping stones toward making the workings of government open to mass media viewing by the public. In 1970, House committees became open to the broadcasting of public hearings with the Legislative Reorganization Act, and in 1977, the House conducted an in-house test of televised coverage.

The televised feed of the House's proceedings, although available to anyone, lacked an outlet. It was during this time that Brian Lamb, the Washington bureau chief for an industry publication called *Cablevision*, pitched the idea for such a conduit of government to cable industry leaders. Lamb had worked in various governmental jobs prior to his job at the industry publication, including as press secretary for U.S. Sen. Peter H. Dominick (R-CO) and in the press office of the White House Office of Telecommunication Policy.

One of the experiences that influenced Lamb's idea for a public affairs channel was when he witnessed an anti-war protest at the Pentagon during the Vietnam War years. The protestors became vocal and active only when a network television reporter was on camera. "Lamb realized that what he was going to see on the evening news was much different from what had actually happened," noted Frantzich and Sullivan (p. 26). This concern that the public get a more complete picture of newsworthy events contributed to Lamb's vision: "My experiences with Washington coverage at the Pentagon and on Capitol Hill led me to believe that there had to be a better way to cover public affairs" (p. 28).

With the House television signal sitting there and the cable industry looking for new programming ideas, Lamb—who had been thinking about a network dedicated to public affairs for a while—formally presented it to a group of cable operators in 1977, according to Frantzich’s biography, *Founding Father: How C-SPAN’s Brian Lamb Changed Politics in America*. With support of U.S. Rep. Lionel Van Deerlin (D-CA), to whom he pitched the idea after an interview, Lamb met with House Speaker Thomas “Tip” O’Neill in 1978 about the idea; O’Neill himself had been dissatisfied with the networks’ “soundbite” coverage of the House. With only a verbal agreement that C-SPAN would provide gavel-to-gavel coverage of the House, the deal was sealed. The House would have control over and staff the cameras during sessions, however. With the financial backing of cable leaders, C-SPAN launched on March 19, 1979, with welcoming remarks by Rep. Al Gore Jr. (D-TN) and a “routine” debate on the creation of a committee studying jurisdictions of committees (Frantzich & Sullivan, 1996, p. 38). The House coverage via C-SPAN went to 350 cable systems serving 3.5 million households.

C-SPAN’s funding comes from cable subscriptions; it receives no governmental funding and accepts no advertising of any kind. Cable operators pay to have C-SPAN included in their lineup, costing about one cent per subscriber in 1979, and about six cents as of 2019. C-SPAN does not rely on ratings and provides public affairs programming as a public service. But serving the public with a dedicated channel to televise the proceedings of the U.S. House of Representatives, and, later, other public affairs and political-oriented programming, was not the only reason for the cable industry to support such an endeavor. As Frantzich and Sullivan noted, “Many members supported C-SPAN because they felt that it would help improve the public image of their industry” (p. 322). And giving public exposure to those who would write legislation concerning their industry might make for more favorable consideration.

C-SPAN in the U.S. Senate

C-SPAN programming grew beyond that initial feed of the House proceedings in just a few years, with 24-hour coverage starting in 1982. In 1984,

both Republican and Democratic national conventions were cablecast live. In the mid-1980s, the Senate was debating whether or not to allow television coverage of its proceedings. According to Frantzich (2008), C-SPAN had wanted to include the Senate to complement its House coverage, and younger senators had supported the idea of having cameras televise their proceedings. An experience by Sen. Robert Byrd, the Democrats’ minority leader, has been documented as contributing to the Senate’s move to join the House in having the cameras on, when Byrd was mistakenly introduced as the Speaker of the House at an event in his state of West Virginia. As Frantzich and Sullivan relayed, “Byrd realized that both he and the Senate had a visibility problem and that the Senate was at a severe disadvantage as long as the House was the only chamber on television” (p. 57). Eventually, the Senate approved cameras, and a second cable outlet, C-SPAN 2, began covering that body in 1986, and went to 24-hour coverage the following year.

C-SPAN Expansion

With both houses of Congress having television coverage via cable, the advent of the Internet allowed for streaming live coverage of both in 1997. In 1997, C-SPAN Radio debuted, with broadcasts in the Washington, DC, area on 90.1 FM, as well as online and by Sirius satellite radio. C-SPAN 3 was added in 2001, offering live coverage of committee hearings, press conferences, and political speeches. With content regularly available through the C-SPAN website, the array and variety of content has of course greatly expanded, both in amount and in reach. Available C-SPAN figures from 2017 showed an estimated 70 million adults had accessed C-SPAN content within the past 6 months, with approximately 9.5 million users doing so several times a week.

Since its inception, C-SPAN has grown from its initial channel that gave cable subscribers a view into the U.S. House of Representatives to two more channels, radio, and Internet content. Beyond U.S. public affairs and political coverage, C-SPAN went international in 1985, with coverage of the Canadian House of Commons. The network’s international programming includes coverage of the British House of Commons, Israeli Knesset, German

Bundestag, and the Russian Duma, as listed by the C-SPAN *Viewer's Guide*.

With improvements in technology, C-SPAN some 40 years later has grown from its minimalist operations to a staff of 260 and a \$60 million budget, which, for the extent of coverage it offers, is still considered “shoestring,” compared with other television news organizations. C-SPAN’s array of coverage includes not only the House and Senate but also the White House in the form of press briefings, presidential events, and addresses. C-SPAN regularly covers Department of State briefings and has cameras following political campaigns as well.

In addition to having cameras on the ground at political events and happenings, its call-in show, *Washington Journal*, gives viewers the opportunity to ask office holders and experts questions, a distinguishing feature that circumvents, up to a point, the one-way communication that characterizes mass media in general. When the Senate is not in session, C-SPAN 2 offers the long-running *Booknotes* program with interviews of authors of nonfiction books. Weekend programming on C-SPAN 3 features *American History TV*, which offers footage of historical sites, archival material of presidential speeches, and lectures by historians. Every C-SPAN program aired since 1987 is included in its free, online archives consisting of more than 260,000 hours of video.

C-SPAN is dedicated to bringing all manner of political and public affairs to the public, but one branch of the federal government that has eluded its cameras is the U.S. Supreme Court. The network has covered confirmation hearings of justices and has been granted requests made to the Court for same-day releases of taped oral arguments. (The Court did allow audio livestreaming of oral arguments in 2020, when justices called in from their homes due to the coronavirus pandemic.) Some justices, such as Ruth Bader Ginsburg and Clarence Thomas, have even been cited as being favorable to television coverage. However, C-SPAN remains unsuccessful in its quest to televise the highest court in the land.

An Unfiltered Lens

C-SPAN’s mission, posted on its website, stipulates that its live feed of the U.S. House and Senate and coverage of “other forums where public

policy is discussed, debated, and decided” are provided to viewers “without editing, commentary or analysis and with a balanced presentation of points of view” (C-SPAN, Our Mission, n.d.). The slogan “Your Unfiltered View of Government” thus reflects the core purpose of C-SPAN as originated by its founder Brian Lamb, whose idea was to show the public “what their government is doing, and let them see the action undiluted” (Frantzich & Sullivan, 1996, p. 24). Lamb resigned as CEO in 2012 and retired from the network in 2019. The noncommentary approach familiar to viewers watching House or Senate sessions, political conventions, state funerals, or footage following candidates on the campaign trail, appears as raw footage with only natural sound or speakers talking on a microphone as the audio component.

The C-SPAN Style

Although C-SPAN does offer hosted programming, such as the viewer call-in show *Washington Journal* and interview programs, Frantzich described it as a “no-personality zone” when it comes to on-air personnel, as well as show guests and story choice (2008, p. 100). Indeed, hosts do not utter their own names during programs, which further deemphasizes them, putting the focus on the content at hand.

Part of C-SPAN’s mission is to “employ production values that accurately convey the business of government rather than distract from it” (C-SPAN, Our Mission, n.d.). With its “no-frills” ethic, C-SPAN’s production style may appear simple and unexciting, when compared with the graphics, music, and special effects common in television news production. During C-SPAN’s early years, with budget limitations and CEO Brian Lamb’s personal frugality, studio sets were minimal and quickly built.

Regarding the look of C-SPAN visually, camera shots appear static, simple, and direct; there are few wide shots, and little if any panning (left-to-right scanning of scenes). Establishing shots, which give viewers a sense of a particular setting, are used, so that viewers feel as if they are “in the room” (Frantzich & Sullivan, 1996, pp. 128–129). This approach is enhanced by the lack of voice-over or commentary, with little interruption

between what is unfolding before the camera and the viewer.

Cameras and Control

C-SPAN's mission not only includes its service to bring to the public an unfiltered view into government but also serves on behalf of decision makers and representatives of government, providing "elected and appointed officials and others who would influence public policy a direct conduit to the audience without filtering or otherwise distorting their points of view" (C-SPAN, Our Mission, n.d.). In that C-SPAN is essentially just the transmission service for the television feeds of Congress, Congress controls the cameras and camera angles, not C-SPAN. The control of these cameras has been the subject of news itself. One such instance, which became known as CAMSCAM, occurred in 1984, when Democratic House Speaker Tip O'Neill ordered the cameras to pan the House chamber, which was empty during special orders speeches (a period for speeches at the end of a legislative day) against the Democrats.

In 2016, when House Democrats staged a sit-in to demand votes on gun control during a recess, the House cameras were turned off, on the grounds that the House was not in session. Some of the representatives used smartphones to livestream the sit-in, which C-SPAN put on the air. To explain why the regular House feed was not on, C-SPAN itself used Twitter to explain: "C-SPAN has no control over the U.S. House TV cameras" (June 22, 2016). The use of cellphone technology to circumvent the traditional television feed in order to bring the event to viewers became news itself: "C-SPAN's decision to work around the rules and show the sit-in was—rather predictably—viewed by some as a sign of political bias," reported Callum Borchers (2016). Although the aim of C-SPAN is to bring government, and other public affairs events and issues, to the public without analysis, commentary, or bias, it nevertheless is subject to such accusations and scrutiny.

Balancing Act

As Borchers (2016) noted, "C-SPAN, which carries live, unfiltered congressional proceedings, is supposed to be the very definition of neutrality."

While neutrality may be the goal, the very fact that the television cameras in the houses of Congress are controlled by Congress presents a challenge to that neutrality. This becomes apparent when considering that even a basic camera movement such as panning might impinge on that goal. The whole picture of government in action thus becomes edited, in a way, as Kyle Peterson (2019) explained: "Take those fiery speeches on the House and Senate floor. An open secret is that lawmakers are often fulminating to an empty room." To interfere in the presenting of such speeches on C-SPAN, such as in the 1984 "CAMSCAM" case mentioned previously, becomes a target for charges of bias, even if C-SPAN was not responsible.

One of the criticisms of C-SPAN stems from the allowance for members of Congress, whether making speeches on the floor or as members of televised hearings, to say what they want without the filter. Graham (2019) pointed to how lawmakers learned to take advantage of being on camera, able to avoid media analysis or contradiction to what they were saying: "circumventing the press and mediation means politicians can also offer complete hogwash directly to the public without anyone stopping falsehoods." This, and the grandstanding that frequently occurs in hearings where committee members are expected to ask questions of witnesses instead, serve as some of the downsides to the C-SPAN mission of bringing government unfiltered to the people.

Politics and its coverage inherently invoke certain points of view, and not having one ironically constitutes a viewpoint nevertheless. C-SPAN's purposive tone of neutrality similarly has been subject to research looking at whether or not it skews politically to the left or to the right. Borchers (2016) cited studies that concluded it skews conservative (one on its coverage of think tanks and another on the political affiliation of guests on *Washington Journal*). Borchers referred to yet another study that looked at C-SPAN's Twitter networks (those whom it follows and those who follow it) and characterized its findings as showing C-SPAN to be "virtually dead center—if anything, a smidge left." As a media news source that aims to provide space for all political viewpoints, C-SPAN's straight-ahead approach that eschews filtering, so common among other cable news organizations,

nonetheless will continue to have its fans and detractors.

DATA JOURNALISM

The term *data journalism*—sometimes called *data-driven journalism* or *computational journalism*—refers to a range of journalism practices in which structured information (data) plays a key role. Structured information can take the form of spreadsheets, databases, and official statistics or might be compiled from other sources specifically for the purposes of journalism, for example, by combining information from multiple documents into a structured format or digitizing information in a way that allows it to be more easily queried by users through interactive storytelling forms and visualization. Structured information might also be complemented or directed by interviews and other newsgathering activities. Research by Megan Knight in 2015 suggests that *data journalism* first began to appear as a phrase in 2008 in *The Guardian* newspaper in the United Kingdom, although the practice predates the term and there is a long history of data-driven reporting that has informed its development. In less than two decades, data journalism has moved from a niche specialist role in the industry to a skill that is practiced in multiple editorial domains, with major news organizations including the BBC rolling out basic data training to all reporters. This entry discusses that recent history of data journalism, the antecedents that inform it, and the debates that are shaping its ongoing development.

Data and Journalism: A Long History

Data regularly had a central role within journalism between the 17th and 19th centuries: as early as 1692 the *Shipping News* was publishing weekly data on the arrivals and departures of ships, while information on commodities, deaths, and taxes was common in newspapers throughout the period. The rise of international trade—and the birth of statistics—created both demand and material for newspapers: The front page of the very first issue of *The Manchester Guardian* in 1821, for example, contained a table of data on schools in Manchester and Salford as part of a story on education reform, while in the United States in the late 19th century, the journalist Ida B. Wells was using data to fact-check the reasons used to justify lynching.

With the arrival of the 20th century, the spread of computers provided a new way to work with data: In 1952, a mainframe computer was used by the U.S. broadcast network CBS to attempt to predict the outcome of the presidential election—although they didn't actually use the resulting data, and the key year for computers in journalism wasn't until 1967 when the *Detroit Free Press's* Philip Meyer used a mainframe to analyze survey data relating to riots in the city.

Meyer's reporting—testing claims about who participated in the riots and why—won him a Pulitzer Prize and helped provide the basis for the field of computer-assisted reporting (CAR), an antecedent of data journalism. His 1969 book *Precision Journalism* established some of the key methods of the field, centering on the use of

databases, surveys, and the methods of social science. It also outlined how such methods could be used to address some of the criticisms of contemporary journalism, such as its reliance on information from sources in positions of power and a lack of independence from those sources.

In addition to the methods promoted by Meyer, the late 1960s onward also saw journalists gain access to a growing amount of data thanks to the enacting of the U.S. Freedom of Information Act in 1967 and Canada's Access to Information Act in 1983, along with training and networks of support through the National Institute for Computer-Assisted Reporting, formed in 1989 to support the development of the practice. As a result, although it was practiced in other parts of the world (particularly through the Global Investigative Journalism Conference, launched in 2001), CAR remained a largely North American phenomenon.

From CAR to Data Journalism

Data journalism was seen as a departure from CAR in two key respects: firstly, the networked nature of data journalism news work (as opposed to the desktop or mainframe-based focus of CAR), and secondly, the emphasis on visual and interactive presentation and consumption of the resulting stories, where the *data* being generated by the user might be used in the telling of the story (through their interactions or inputs). Both were facilitated by the introduction of internet-based technologies into the production and consumption of news. In addition, data journalism was marked by cultural differences such as transparency and sharing of data and collaborative work practices that involved contributors such as developers and designers from outside of the newsroom.

The 2005 project chicagocrime.org was a particularly influential demonstration of this new form: an interactive map of crime reports in the city, it was generated by a computer script that programmer-journalist Adrian Holovaty had written to gather information (*scrape*) from the police department's website. These data were then automatically combined with Google Maps so that users could navigate the crime data in the way that was most meaningful to them. Unlike traditional CAR reporting, it was networked, interactive, and visual and centered on providing the data

itself to an audience rather than a narrative interpretation of it.

Although CAR had emerged and flourished in the United States, data journalism's growth had a much stronger European dimension: In the United Kingdom, there had been an active *open data* movement campaigning for greater government transparency since the start of the 21st century, and this laid much of the groundwork for data journalism practice in the country. The organization mySociety, for example, risked legal action to open up data on how politicians voted, then worked with Channel 4 News on its 2005 election coverage; in the same year, the BBC's Backstage project (an influence on Holovaty's work) opened up data for developers to experiment with; and a year later, *The Guardian* launched its *Free Our Data* campaign. As governments in the United Kingdom and North America began to open up their data, news organizations caught the bug too, from *The New York Times*'s launch of their Open blog and Visualization Lab in 2007 and 2008 to *The Guardian*'s Datablog in 2009.

The availability of data grew not just as a result of political initiatives, nor was its growth limited to the United Kingdom and North America: As the role of the internet in society expanded, growing amounts of information were being rapidly digitized in every sector. This also helped distinguish data journalism further from its predecessor CAR. Where CAR relied on formal sources of information such as official databases, or social science methods such as surveys, and as a result, tended to focus almost exclusively on hard news topics, data journalism was a much broader church: Sources for data journalism might be compiled by obsessive sports or film fans; data might be generated by analyzing pixel values in pictures or the frequency of words mentioned in social media chatter. This opened up subjects that hadn't been reported in this way before.

Major stories played a significant role in demonstrating the need for data journalism skills in the newsroom. The WikiLeaks-driven stories of 2010 were significant in this respect, but later, the Panama Papers, Luxembourg Leaks, Football Leaks, and other *megaleaks* stories would regularly remind news organizations of the need to be able to deal with increasingly large and complex data sets if they were to compete with their rivals.

Meanwhile, a commercial model for news online that increasingly valued user engagement provided a commercial argument for investing in data journalism capacity: interactives, visual journalism, and investigations all demonstrated significant engagement with readers.

Data Journalists, Data Teams, and Transparency

Data journalists and data journalism teams vary widely in their makeup and output. Nikki Usher's 2016 study of interactive teams in the United States, United Kingdom, and the Middle East, for example, identifies how some reporters produce work daily, while others work on projects over longer time periods. While some teams work with other parts of the organization, others stand alone. Usher also highlights teams having *hacker journalists*, data journalists, or programmer journalists and the impact those roles had, particularly on expectations of transparency and accountability from journalism itself. Many data journalists, for example, provide links to data and code on dedicated repositories on sites such as GitHub (a form of *disclosure transparency*), while *The Guardian's* Datablog would regularly feature contributions from readers, and the newspaper also hosted user visualizations of their data on the newspaper's Flickr account (both forms of *participatory transparency*). Industry *hackdays*, which bring together journalists and developers, are another example of this practice.

Transparency in data journalism has roots in the increased collaboration between journalists and developers and in trends such as the open data movement, civic tech, hacktivism, and the open rights movement. That transparency, however, is not always realized in wider journalistic output that draws on data. A number of recent analyses have shown that a minority of statistical references in broadcast output identify the source of data, let alone link to it, with similar patterns observed in U.S. broadsheet newspapers.

Computational Journalism

Later literature around data journalism has attempted to make a further distinction between it and *computational journalism*, with the latter

positioned as having a particular focus on the application of computing and computational thinking (i.e., the process) rather than the subject of such processes (the data).

Chris Anderson, for example, distinguishes between three types of journalism. The first type is the *journalism of occurrences*, traditional news work focused on episodic, individualized, narrative-format reporting, relying on oral evidence for context. The second type is *the journalism of social science*: the precision journalism and data journalism of factualizing and providing context via statistics. *Computational journalism* is the third type, which Anderson argues combines the first two to create structured stories that represent applications of computational thinking to news reporting. This category therefore includes the relatively recent forms of *automated* reporting whereby algorithms are built, employed, and maintained in order to identify newsworthy events and/or *report* them, whether internally or in a public-facing format.

In this taxonomy, while data journalism is typically focused on the scale of an issue, its variation, outliers, or ways of allowing users to explore those facets for themselves, *computational journalism* is, like traditional journalism, focused instead on events—summarizing the salient newsworthy aspects in an efficient and timely manner.

This *robot journalism* relies on predictable sources of data in areas where stories can be written routinely at a scale or speed that human journalists cannot match. Some areas where robot journalism is used to report basic information include sports matches, crime reports, weather, and company financial reports. The Associated Press (AP), for example, use it to generate thousands of earnings reports that wouldn't have otherwise been produced.

In addition to adding increased scale to reporting, robot reporting has typically been more accurate: Around 7% of human-written company earnings reports at AP contained errors (such as transposed digits) compared to around 1% when generated automatically.

Critical Issues

Data journalism has been widely recognized as having the potential to support journalism's

normative role, lowering the barrier to investigative journalism and allowing journalists to manage volumes of information that previously would have been impractical. But its development has also faced a range of challenges and opportunities, including a lack of practitioners and time, technical barriers, challenges of verification and accuracy, of maintenance, archiving and *linkrot* related to interactive storytelling, and of credibility and readability.

Ethical challenges raised by data journalism practice, for example, include tensions between privacy and the public interest where data relate to people—especially when the further ethical dimension of transparency means that raw data are shared. Data compiled from online sources might also raise legal issues around the copyright and database rights surrounding that information, while leaked data may raise issues around data property rights.

The use of data is a subject to explore critically as a contemporary challenge for journalists. Among the issues that must be addressed are those around data selection, collection, analysis, and security. Not only can data be the source of data journalism, they can also be the tool with which the story is told, through interactivity. Like any source, data should be treated with scepticism; and like any tool, we should be conscious of how data can shape and restrict the stories that are created with them.

For example, the open data agenda and spread of right to information laws have made it easier to access data from the public sector, but less so the private sector, creating the potential to skew coverage accordingly. The rise of big data represents a further challenge, with commercial access to big data rivaling traditional academic centers of knowledge and government collection of demographic information. Some data journalism projects seek to “give a voice to the voiceless” by creating data where none existed before: examples include The Bureau of Investigative Journalism’s Naming the Dead project compiling data on those killed in covert U.S. drone strikes in Pakistan, or *El Universal*’s “Desaparecidos”: a database of the 50,000 Mexicans and Colombians who have disappeared in recent years, many as a result of organized crime.

Ultimately data, like media, are a way of encoding information, which is then decoded by an

audience. Certain uses of data have revived debates about gatekeeping and the availability, selection, and treatment of information. Data can be incomplete, biased, or contain errors. Data journalists address this using similar approaches to their interactions with human sources: by understanding how data were collected and potential associated methodological issues, by understanding the potential motivations of those collecting the data, by seeking other sources (whether data, documents, or human) that can confirm or dispute what the data are saying, and by including important contextual information in the resulting piece of journalism so that audiences can judge it accordingly.

In addition, methods can be employed to systematically check data for erroneous outliers, statistically suspicious patterns, or to identify and clean *dirty data* before analysis. In some organizations, data journalists will work in pairs to independently analyze the same data in order to test that they arrive at the same conclusion when using different methods.

DATA VISUALIZATIONS

Data visualizations are central to data journalism and help to distinguish it from overlapping journalism forms, such as investigative journalism, precision journalism, computer-assisted reporting, computational journalism, quantitative journalism, and database journalism. Data journalism projects usually involve enormous amounts of complicated information and data. Visualizations play a key role in turning numbers into easier-to-understand information content.

The increased availability of certain forms of data and the use of data visualizations has had an impact on the news media landscape. To make effective use of visualizations, a data journalism team should consist of reporters, developers, data analysts, and designers. Interdisciplinary collaboration among people with different trainings is highly valued and may be required in news production, as data-driven storytelling becomes mainstream. Since data-processing tasks are now major components of the newsroom's environment, computational literacy has become a fundamental requirement for journalism practitioners. A lack of computing knowledge and skills may constrain journalism professionals in news production, particularly in smaller news organizations.

This entry discusses the significance and evolution of data visualizations and their applications to journalism practice. Data-driven storytelling draws on a wide variety of skills—from simple data collection to statistical analysis to graphic design to coding and programming, among which data visualizations are core to the process of news production with data.

Data Visualizations in News

Data journalism, that is, using numerical elements in the production and distribution of news with

computer-assisted tools, is an emerging area in the field of information and mass media. According to a 2017 research report by Google News Lab, one of the first comprehensive multinational studies of data journalism, 42% of the journalists surveyed use data regularly to tell stories, and 51% of news organizations have a dedicated data journalist on staff.

Journalism stories involving big databases and statistics have won several Pulitzer Prizes for general news or investigative reporting since the 1980s. Examples include the *Montgomery Advertiser's* use of financial analysis to investigate the state's high infant mortality rate in 1988 and a series of investigative articles published by *The Wall Street Journal* on the admission preferences for white privileged students in elite American universities by Daniel Golden in 2004. In addition, the staff of *The Washington Post* won the 2020 Pulitzer Prize (in the Explanatory Reporting category) for its climate change series that analyzed global temperature records and showed “with scientific clarity the dire effects of extreme temperatures on the planet” (The Pulitzer Prizes, 2020).

Tables, charts, maps, timelines, infographics, animations, and interactive graphs are common visual elements utilized to present data in data-driven storytelling. The basic ideas behind data visualization are not new. Diagrams, maps, and sketches have been used to depict events since ancient times. Maps were drawn to assist in exploration, navigation, and the identification of the locations of the stars in the universe. In ancient Egypt, for example, mapping of stars was used to locate the appropriate positions to construct towns and habitats. By the 18th century, new techniques were being used to present data in fields such as cartography, with theme-based maps based on medical, geological, or economic data instead of only showing geographical locations.

From the onset of the 19th century, graphics began to form the shape of present-day visualizations, thanks to advancements in the field of statistics. Over the course of the 19th century, various plots, pie charts, bar charts, histograms, and line graphs were conceived and developed. These types of illustrations started to appear in scholarly publications to facilitate the readers' understanding and interpretation of textual narratives. During this time, a wide variety of shapes and numerous

colors were employed in sophisticated graphical depictions to effectively present data and statistics. Data visualizations have since become common in textbooks and governmental reports.

Data visualizations also played an instrumental role in presenting and promoting scientific findings in several fields such as biology, humanities, and astronomy. In infographics, various charts and illustrations are applied to reorganize figures and words, and sometimes to visualize numbers, thus making it easier for readers to digest complex information. This practice can be traced back to the 1930s, when *Graphic Presentation*, a guidebook on infographics production, was published.

It is commonly agreed that the first prominent news outlet to publish a news story with data illustrations was the UK-based *The Guardian* (or *Manchester Guardian* as it then was). On May 5, 1821, it published its first issue, with data illustrations in an article that included a table with tallied data regarding how many pupils attended schools in two cities and the average annual spending in the United Kingdom. The table illustrated how many pupils received free education and how many poor children there were, which was helpful for understanding the educational system of the country.

Technical Aspects of Data Visualizations

The development of data visualizations is intertwined deeply with breakthroughs in the field of computer science as well as with increasingly available open data. As such, technological aspects play an influential role in data visualizations.

Visual Appeal

Visual appeal is core to data visualizations. This dimension of data visualizations concerns the kinds of visual elements used and whether innovations in visualization are made. Basic models have been developed via computer programs to update the forms of visualizations that can be utilized in news production.

Interactivity

This dimension of data visualizations concerns whether and how data journalism uses computational tools and interactive features to engage with

audiences. Interactivity is a key characteristic of new media in the digital age. As in new media journalism, interactivity changes the role of an audience from passive information receiver to active content consumer, selector, and contributor.

Many data visualization projects pay attention to user-experience design and human-computer interactions. One way to increase interactivity is to involve audiences in the process of content display. By designing interactive visualizations, data journalism projects allow audiences the possibility to filter and choose information based on their interests. Projects related to political elections often offer this kind of interactivity by allowing people to select candidates they want to know more about and compare them with their rivals.

Journalistic Aspects of Data Visualizations

Data visualizations are an in-depth stage of data processing in news production. Visualizations can reveal more concrete results and observations regarding a news topic. In the reporting phase, visualizations may help identify themes and questions, reveal significant hidden issues that are seemingly unimportant, find examples to support an argument, or show loopholes in the reporting. In the presentation and publication phase, data visualizations can illustrate change over time; compare values; show hierarchy, connections, and ties; and trace flows. They can illustrate a point made in a story in a compelling way. Particularly when the visualizations include interactive features, they allow audience exploration and participation.

Some research has suggested that data visualizations generate more positive evaluation of news articles, measured by the extent to which the study participants thought the news articles were in-depth, useful, informative, and relevant. The advantages of visualizations have been analyzed in terms of visual reporting, audience attention, universal language, visual processing, ease of recall, and audience interaction. Biological evidence collected to illustrate the effectiveness of data visualizations, including the U.S.-based *eye-tracking* research run by the Poynter Institute for Media Studies, reveals that visual elements draw an audience's attention more quickly.

Research has also indicated that the use of data in a news article's text does not make the audience see the article as more credible but that data visualizations can increase the audience's perception of news credibility. Data visualizations can turn a news report with tedious numbers into a significantly more reader-friendly one.

Data Visualizations in Practice

As previously mentioned, tables, charts, maps, infographics, and interactive graphs are the common visual elements in data journalism. In the visualization process, readily available software applications, such as HTML5, CSS3, and JavaScript, are among the top tools used in major newsrooms. These, however, require a certain level of knowledge and skill in coding and programming. Software and tools, such as Adobe Illustrator, Tableau, ChartBuilder, and D3, are also frequently used to generate visualizations. As different colors and shapes are used in visualizations to categorize figures and values, a working knowledge of and aptitude for design may also be required.

Mapping is very commonly used in data journalism, as it can be used to convey complex information and integrate other elements, including nongeographical factors. GeoCommons shares data and boundary data to create global and local maps. While iCharts specializes in small chart widgets, ChartsBin is a tool for creating clickable world maps. Google Fusion Tables and Tableau have been used for simple mapping needs, whereas CARTO and Esri are professional, sophisticated mapping tools for visualizing data based on geographic information systems.

Piktochart is a web-based infographic application that allows users without advanced skills as graphic designers to easily create infographics and visuals using themed templates. It was launched in 2012 and has remained popular with a large user-base. The version of Piktochart that was released in 2017 includes an HTML publisher that allows users to create visuals that can be viewed online or embedded into a website as well as allowing the user to include multiple interactive elements.

Google Fusion Table was once a popular tool for simple visualizations that required no coding knowledge and was especially appropriate for brief forms of data journalism. The tool was

launched as part of Google News Labs in 2009. Google shut down its cloud visualization service at the end of 2019, but a more powerful visualization tool called *Tableau* also requires little coding or programming skills. Tableau offers a simple drag-and-drop interface with which different data sources can be combined to create sophisticated visualizations.

D3, a JavaScript library with the full capabilities of web standards such as HTML and CSS, is also a powerful and popular tool for data visualizations in newsrooms. D3 is efficient in making complex visualization projects as its users may only need to import data and choose the proper structure (form) to display them, without having to write code from scratch.

R is a programming language and free software environment that is increasingly popular among data journalists. R allows journalists to quickly iterate through simple or sophisticated data visualizations to explore the data and see what works best to communicate the information. It is also handy for exploring the underlying connections between different graphs. Finally, many journalists continue to use Microsoft Excel for data processing, including simple visualizations.

DECEPTION

Deception has been lauded as an effective tool of last resort for investigative reporting for more than 100 years. When used in the pursuit of material that is in the public interest, it has been invaluable in helping the press meet its watchdog function. When justified, journalists can provide persuasive explanations to audience members for why the technique was required to access information that the public needed to know. However, deception used for other reasons, such as to add unnecessary drama to a report, can damage journalistic credibility.

This entry further defines deception in journalism and discusses why it poses an ethical problem. It then looks at how deception can be justified and provides some examples of journalistic deception. The entry focuses on deception in the newsgathering process or by withholding information from the public in news articles. It does not deal with publications that are intended to deceive to generate advertising revenue and/or for political reasons.

Definition and Conditions

Deception occurs when one or more persons attempt to lead others to form or maintain a false belief. Deception may occur through action or inaction. People are deceptive even if they are *caught*, or the person they intend to deceive was not fooled. Deception is ethically questionable, which means that it is wrong, unless accompanied by adequate justification.

The first step to analyzing deception is conceptualization. It is necessary to determine whether

an act counts as deception before determining whether the deception is justified or not. Intention is required for any act to be deceptive. When one has uttered a false statement without intention, we say that the person is mistaken. To say that a badly placed sign *deceived me* is to speak metaphorically.

Intention is a necessary condition in that an act is deceptive, even if the deceiver is unsuccessful. For example, when a reporter lets others assume that he is a police investigator to get access to a meeting open only to law enforcement officers, he has acted deceptively even if someone recognizes him as a journalist and tells him to leave. But, one can have the intention to deceive without following through. Acting deceptively, in addition, requires one of the following three sufficient conditions.

Uttered Falsehood or the Nonverbal Equivalent

Making a false statement with the intention of leading others to form or maintain a false belief is deception. A journalist has acted deceptively if she tells a real estate agent that she wants to buy a home when the intent is really to see whether a neighborhood is redlined to limit racial integration. There are also nonverbal equivalents of lying. For example, if a journalist presents through dress or circumstance to make others believe that she is a doctor, she has acted deceptively.

Withholding Information Under Certain Conditions

When a person withholds information with the intention of leading others to form or maintain a false belief and, in the process of withholding the information, breaks a law, breaks a promise, cheats, or neglects a duty, the withholding of that information is deceptive. For example, if a reporter who has been subpoenaed fails to disclose all that he knows, he has acted deceptively by breaking a law.

If a reporter promises not to reveal a source's name without talking to the source first and then discloses the name without talking to the source, the reporter has acted deceptively by breaking a promise.

If a columnist goes to a party and does not tell those from whom he is gathering quotes that they

are on the record, the columnist has deceived by cheating. The journalist has failed to meet reasonable expectations that people have at a party, that is, that those attending are not collecting information that will be published.

Journalists can also act deceptively by withholding information that they have a duty to tell. The duty, or role-related responsibility of journalists, is to provide citizens information that citizens need for self-governance. (Journalists may also report on less weighty matters, but the unique responsibility of journalism is to provide citizens with information needed for self-governance.) The published material serves this public interest. If a news organization presents material to serve a politician's or advertiser's agenda rather than serve the public interest, that news organization has acted deceptively toward their audience members. This is deception by failure to do one's duty.

Truth Telling With the Intent to Mislead

It is possible to be entirely truthful, but to tell that truth with the intent of misleading. For example, journalists might pressure potential sources by telling them that a story will run whether or not the source comments or responds to the journalist's questions. While true, unsophisticated sources may falsely believe that the story will be less incriminating with their response. However, quotes from the source will often make the source look worse rather than better. In this case, journalists tell the truth with the hope of misleading the source into believing that he should (or must) comment. The journalist's intent is to mislead the source.

Responses to a news organization's request for documents under the Freedom of Information Act have been known to include not only information requested, as required by law, but to also include an extraordinary amount of unnecessary data. This "needle in the haystack" approach amounts to deception because the intent of providing the unnecessary data is to mislead a reporter into missing incriminating information.

The Ethical Problem of Deception

Deception is an ethical problem because of the potential harms to those deceived and others. To

say that deception is ethically questionable means that the act is wrong unless justified. Unjustified deception causes harm to the individual deceived, to the larger community, to the practice of journalism, and to the deceiver him or herself. The individual deceived is deprived of the freedom to make truly educated decisions. This is true even if the individual does not realize that he has been deceived.

The larger community is harmed because societies depend on trust. If a stranger asks a stranger for directions or for the correct time, it is with the assumption that he will be told the truth to the best of the ability of the person answering. Deception is successful because people assume that others are generally truthful. Each act of deception chips away at public trust.

Journalism is harmed by unjustified deception because any story based on deception alerts potential sources that journalists might deceive them too. Reporters depend on the trust of their sources to develop information for news stories. Audience members, when exposed to unnecessary or unjustified journalistic deception, wonder how news organizations determine when to be truthful and when not. Deceptive process leads to concerns that the products might also be deceptive.

Last of all, many philosophers have suggested that the deceiver is harmed by his or her own deception. A person of integrity knows herself to be the kind of person who can overcome temptation and choose not to perform unethical acts. The person who deceives knows herself to be a liar. A person becomes more ethical, more morally sophisticated by acting in ethical ways. A person becomes less ethical, stuck at a low level of moral development, by performing unethical acts.

Justification of Deception

To say that an act is deceptive does not mean that it is necessarily wrong. In some cases, people want to be deceived. Many people like to be surprised by parties or gifts, even if the person was deceived prior to the surprise. The audience members at a magic show want to be deceived by the magician's tricks. In these cases, the people deceived have given their consent to the deception.

Deception can also be justified by convention. In some countries, such as Australia, working

journalists are required to wear press credentials even in public spaces. In the United States, journalists may legitimately collect crowd reactions or quotes from speakers in a public space without disclosing their identity. It would be deceptive to fail to disclose one's journalistic identity in this situation in Australia, but not in the United States because the rules and expectations are different.

Deception may be justified by paternalism, on the grounds that lying or withholding information is in the best interest of those deceived. For example, when news organizations report on emergency notifications to evacuate, they may decide not to include speculation from a public official that everyone may not get out in time since this speculation could cause panic. The comments from the public official could instead be reported after the evacuation.

In addition, citizens implicitly agree to be deceived when they allow undercover law enforcement techniques such as unmarked police cars, speed-checking by radar, and sting operations. The important difference between undercover law enforcement and undercover journalism is that there is governmental control of deception in law enforcement. News organizations and journalists are on their own in determining whether deception is justified.

Four criteria need to be considered in determining whether journalistic deception is justified:

1. *All usual means of gathering important information have been attempted and exhausted for uncovering facts needed for citizens' self-governance.* It is not enough for journalists to decide that it would be easier to get information through deception as compared to pursuing the information through honest means.
2. *Regulatory agencies that have the responsibility of overseeing the problem have been approached.* If government is failing to do its job, the reasons for that should not be lost in an undercover display of the failure.
3. *No innocent person is deceived.* If the story is important enough to warrant deception, the problem is big enough that it should be possible to limit those deceived to only persons involved in the suspected wrongdoing.
4. *After the undercover investigation, the news organization or journalist must publicly disclose questionable tactics, regardless of the outcome.* Transparency lets the subjects, sources, and audience members know that the news organization or journalist knows why deception was thought to be necessary in this case.

Some Examples of Journalistic Deception

In 2015, the news organization Al-Jazeera sent an operative undercover, falsely claiming to be a gun enthusiast, to hear the National Rifle Association (NRA) leadership discussing the organization's stand on mass shootings. The ruse included creating a website for the fictitious Gun Rights Australia. The results were broadcast in a documentary film.

In 2017, Project Veritas, an organization known for undercover operations to expose media bias, had a female reporter falsely claim that she had been impregnated by Alabama senatorial candidate Roy Moore. When approached by the fraudulent source, *The Washington Post* chose not to publish the claim. Instead, the *Post* investigated further and confronted the source with her lies. The *Post* published a story about the undercover sting operation.

Both of these examples seem justified under Criteria 2 through 4 in the previous section. In neither case is there official oversight that is being ignored; the only people being deceived are those suspected of wrongdoing; both organizations were transparent about their techniques. However, a review of the first criterion listed in the previous section raises questions about both examples.

Al-Jazeera does not explain why disillusioned NRA members could not have been used as sources for the information uncovered. It may be that an undercover operative, as used by Project Veritas, is the only way to see whether a news organization is doing a good job of investigative journalism. But, while Project Veritas is upfront about its use of undercover operatives to achieve a more ethical and transparent society, it does not acknowledge the problems with deception or explain why deception is justified as their standard tool.

Reporting in the digital era has led to new issues of deception and disclosure for journalists and news organizations. It may not occur to users of the internet how closely their actions are tracked. News organizations track which articles draw users to their websites. They track who clicks on the articles and for how long the article is open. Is tracking readers deception or is the lack of clear disclosure justified by the unread terms of agreement that each user had clicked to agree? Those tracking argue that users should know that their data are gathered and used. Many readers, however, are surprised to learn how their actions are being followed.

DEMOCRACY AND THE MEDIA

As a form of government that centers around the rule of the people, what is commonly referred to as *liberal* or *Western* democracy hinges on central tenets of open and free societies. One of these tenets is the freedom of expression and of the press. Independent media have the potential to inform citizens, hold truth to power, provide means of public participation, and empower people to make educated electoral decisions and leave their imprint on society. Illiberal democracies, authoritarian, or totalitarian forms of governance may tend to expand their control of (or even close down) existing media critical of ruling parties and put restrictions on freedom of expression. As of 2021, some contend that media are under attack not only in the realm of politics but far beyond. They may face interconnected crises of trust, of literacy, of information quality and veracity, of epistemic authority, as well as of infrastructure. This entry provides a brief sketch of liberal democracy and the media and examines the relationship between the two from a variety of perspectives: It traces the conceptual beginnings of media and democracy, discusses the role of free speech and free media, the relationship the media have with the people, theories of media systems, principles that govern media between public interest and the market, and lastly, pathologies of media and democracy. While there certainly are media outside of liberal democracy, it is difficult to envision forms of liberal democracy that preclude media or exist without them.

Conceptual Beginnings

Democracy refers to the rule of the people, harkening to the Greek words *dēmos* for “people” and *kratos* for “rule.” Exactly who constitutes the people, whether they are involved in a form of direct or representative democracy, whether a constitution enshrines a core set of values, and how governance and law are to be executed is then defined in theories and contracts outlining the relationships between the state and its people. Basic rights often include universal suffrage, protection of minorities, and the rights to assembly,

speech, life, and equality, among others. Democracy relies on safeguards to protect itself from tyranny, such as adherence to the rule of law, majority rule, qualified majorities for certain decisions, or the separation of powers between judicial, executive, and legislative branches of government.

British-Austrian philosopher Karl Popper, in his 1945 magnum opus “The Open Society and Its Enemies,” reflects on a question at the core of contemplating liberal democracy: He argues that political theory should focus not on who should be considered legitimate to rule, but rather, how democratic systems could be designed so that a bad actor in power could be removed without force or violence. In liberal democracies, checks and balances and systems of accountability enable the people to hold the most powerful accountable. The media, too, fulfill a critical role in this context.

In the United States, media are often referred to as the *Fourth Estate*. Its present-day meaning casts them as a watchdog holding powerful forces accountable by virtue of their role as a distinct and independent fourth estate beside the branches of government. While the quality of democracy is difficult to measure, one important indication is the existence of a free and independent media. If the people are to rule, they must be well-informed in order to meaningfully engage in civic duties such as voting or running for office. Media assume a critical role in political communication, as they convey information on policy and politics as much as on public attitudes. What is commonly referred to as the *media*, a term used to relate to the institution of the press, fulfills the role of an intermediary between elected officials and the people. This perspective of the press serving as an arbitrator comes with its own criticisms: Thinking of the press as a disseminator of information makes it vulnerable to accusations of bias.

The term *media* confers a sense of institutionalism—a concrete group of actors that can be thought of as part of “the media”: print outlets, broadcast and radio, online media. Such an institutional view situates the media as a unified actor in society alongside others, such as the state or academia. From an institutional viewpoint, people and organizations are either part of the media, marked by specific criteria, or they are not. Professionalism of the people who work in the media is often used to demarcate what constitutes “media.”

Importantly, when one speaks of the media here, one speaks of news media (vis-à-vis a range of other media, for instance, entertainment media). Journalists as protagonists of news media distinguish themselves through shared professionalism, ethics, vocational educational offerings, self-regulation, but also regulation of the media by the state, checks and balances such as ombudspersons, and membership in professional organizations. Unlike other professions such as law or medicine, journalists in most countries are not professionally licensed through qualifications akin to how a bar exam marks the entrance requirement for people who want to practice the law.

However, conceptualizations may also be construed more broadly, including participatory and citizen media in which the people become producers. Social media platforms, while most often not acting as primary producers of media content, are sometimes compared to media outlets as they fulfill similar functions such as the dissemination of news, or selling advertising space alongside content. For instance, media policy scholars Philip M. Napoli and Robyn Caplan have pointed out how firms such as Google or Facebook insist that they are technology—not media—companies, for regulatory and other reasons.

Since Marshall McLuhan’s affirmation that the media are the message, a paradigm shift, acknowledged by researchers such as Stig Hjarvard as “mediatization,” describes how media have permeated all aspects of social life—public and private, political, and religious. Democracy, too, has been mediatized to the extent that political life happens throughout and within media. It is reported on and critiqued in media, discussed in social media platforms, and in some cases, participative forms of democracy harness media technologies, such as tools that enable online voting.

Free Speech, Free Media

The histories of democracy and the media are interrelated. An important example is marked by the invention of the movable Gutenberg printing press in the 15th century and the possibility to mass-produce media, which brought on important questions about power and censorship and the role of the state as it relates to media. As the production of media became more accessible, so was

rulers' alertness that information is a powerful weapon. Thus, copyright and libel laws were used to police information and its dissemination. Defenses of freedom of expression as articulated by political philosophers are testament to this, articulating claims to access and expression as crucial rights. In 1644, John Milton's "Areopagitica" urged the Parliament of England against pre-publication censorship. At around the same time in Europe, Dutch philosopher Baruch Spinoza anonymously published his "Theological-Political Treatise," in which he discussed the role of the state in society and emphasized the importance of freedom of expression. British philosopher John Locke's "Letters on Toleration" were also influential for the development of a contemporary understanding of freedom of expression, as Locke's defense is one of freedom of religion in the sense that religion cannot be imposed on people.

About 200 years after Milton, John Stuart Mill's 1859 essay "On Liberty" heralded an ardent defense of freedom of expression, arguing that in a marketplace of ideas, truth would win, and therefore falsities should be allowed to circulate. According to Mill, the exchange of opinions itself is productive as it necessarily leads to the truth, and in the process, to a higher degree of certainty about truthfulness. French Enlightenment thinker Voltaire's philosophy is famously summarized by Evelyn Beatrice Hall in "The Friends of Voltaire" in the oft-quoted statement "I disapprove of what you say, but I will defend to the death your right to say it," (p. 199) published in 1906 under the pseudonym of S.G. Tallentyre.

Notably, the First Amendment to the U.S. constitution of 1789 was introduced via the Bill of Rights, a document which expanded the constitution and added a set of liberties and rights. It prohibited the federal government from interference into freedom of expression and of the press. The notions of free speech, a free press, and a free market/marketplace of ideas lay the foundations for the commercial press system in place in the United States. The ways in which—at least in the United States—ideology equated freedom of speech and the press with a free market, led toward a path of media commercialism, and of the news media as a professional institution left fending for itself.

Internationally, the postwar era brought to the fore two important doctrines articulating the

importance of freedom of expression and the press. In 1948, the United Nations adopted the Universal Declaration of Human Rights. One of the articles of the declaration articulates that every person has a right to free expression and to share their opinions through the media. In 1953, the Council of Europe adapted the European Convention on Human Rights, which also articulates freedom of expression as a human right.

Theories of Media Systems

The relationship between the media and the state has generated a host of concepts and theories. In their classic 1956 treatise "Four Theories of the Press," Fred Siebert and colleagues propose four normative frameworks that describe media systems—an authoritarian, social responsibility, libertarian, and a Soviet communist theory of the press. The book left a lasting mark on media and journalism research. It has received criticism on various grounds such as that its proposals are too normative, are lacking depth, or are unfit to describe certain media systems. Scholars such as Denis McQuail have called for adding an additional category of "development theory," to account for media systems morphing from developing to developed market economy commercial systems. Still other categories of the press have been presented since, such as William Hachten's five concepts (Western, revolutionary, developmental, authoritarian, communist) or Herbert Altschull's three movements (Market, Marxist, and advancing journalism). Clifford Christians and colleagues' work finds middle ground between free market-based media and state control, as manifest in systems in Europe that include private and public actors. In 2004, Daniel Hallin and Paolo Mancini published the influential "Comparing Media Systems," a book which strayed away from laying out normative ideals of what media should be, and instead pursued a descriptivist approach toward mapping what media systems are in existence. The authors propose different axes to categorize media systems: media market structures, partisan ideology, journalistic professionalism, and the role of the state. By parsing out different media systems along these criteria, they describe three models of media systems (though their evaluation is severely limited by its emphasis

on Western democratic systems): A polarized pluralist, or Mediterranean model, a democratic corporatist, or North/Central European model, and a liberal, or North Atlantic model.

Public Interest Versus The Market

The European postwar model of media is summarized by Robert Picard's "democratic-socialist theory of the press." No such press system came to fruition in the United States. In the book "America's Battle for Media Democracy," Victor Pickard emphasizes how in the 1940s the United States saw a series of important developments that, for a moment in history, articulated a social democratic path toward what he calls "media democracy." The 1946 Blue Book of the Federal Communications Commission (which is the national communications regulation agency in the United States) articulated public service responsibilities for broadcasters. The 1947 Hutchins Commission defined what the role of the press should be in society—and left a mark on what is today considered the social responsibility of the media toward society. In short succession, the FCC in 1949 introduced the Fairness Doctrine, which articulated how political views must be balanced between different sides on broadcast media (the doctrine is no longer in place today).

As media outlets vie for audience attention in highly competitive environments, it becomes more difficult to maintain the very public interest principles in content production that make them imperative for liberal democracies. This is the notion of journalism producing what is called *merit goods*, goods that are socially desirable but not financially viable or profitable. According to Victor Pickard, journalism when understood as a merit good is precisely what media democracy hinges upon. Indeed, while some countries combat capitalist market pressures through independent but publicly funded public service media, libertarian media markets that are almost exclusively commercial are facing bigger difficulties.

The Media and the People

Thinking about democracy and the media brings up critical questions as to who exactly is in charge of creating media, and what role and agency

media audiences are granted. Two important thinkers of the early 20th century, Walter Lippmann and John Dewey, arrived at rather different opinions as to what precisely the role of journalism in society should be. According to Lippmann, journalism should explain politics to citizens who would otherwise not be able to grasp such complexities. Dewey, on the other hand, envisioned journalism as a force to inform people so they could make decisions. Contemporary thinking on the role of journalism in liberal democracy takes audience members seriously and casts media consumers as active participants of democratic media ecosystems. Media are vital for an informed citizenry. In a global world order in which different people from differently organized societies congregate on the internet, much in the sense of Manuel Castells' network society, new communicative infrastructures such as social media platforms or other technologies can throw conventions of communication, power, and institutional orders in disarray.
